PREFACE

THE purpose of this bibliographical series is to supply descriptions of the outstanding scientific, medical and technical books written by citizens of Canada and the United States of America, published in the U S A., and available for both domestic and foreign distribution. Its origins are fully described in the Preface to the first volume published in 1946 under the title "Scientific, Medical and Technical Books Published in the United States of America 1930–1944 a Selected List of Titles in Print, with Annotations edited by R. R. Hawkins."

A primary motive in the establishment of the series was the furthering of cultural relations between the United States of America and other nations. Experience has shown that the series also has considerable usefulness in our own country It has become well established as a book selection guide in the libraries of the United States of America as well as in libraries and other institutions abroad

The original work represented a selection from books published during fifteen years 1930–1944 The first supplement, published in 1950 provided a selection of books published in original or substantially revised editions during the years 1945–1948. The second supplement provided a selection of books and substantially revised editions published during the years 1949–1952 The present volume is not a third supplement, but is a second edition of the original basic volume The arbitrary limit of the year 1930 was dropped so as to include a few books published before that year which are still useful and standard in their respective fields. The upper limit is essentially 1956 as stated on the title page. However as new editions published in 1957 and early 1958 of books already selected for inclusion came to the notice of the editor notes of them were included in the descriptions. The description pertinent to the edition published before 1957 was retained, but the existence of the new edition together with its pagination and price was noted in the last sentence of the description.

The scope in regards to kinds of publications included is the same as in the first edition and its supplements. Again, books published in regular book trade channels predominate. Monographs, symposia and papers published by American scientific and technical societies are included, but these are not so fully presented as trade books primarily because many such publications are printed for members of the publishing society and for exchange with other societies rather than for general distribution A selection of documents published by the National Government is included but the publications of state and local governments are not represented, except for books published by state university presses and distributed through established book trade channels The publications of commercial firms not in the book publishing business—for example publications of a manufacturing company about its own products—have been excluded except for about one dozen such publications which have come to be recognized as standard works transcending their applications to the publishers products.

The subject scope of this work is indicated in the title and in more detail in the Table of Contents. Medicine the pure and applied sciences and technology are covered, but there are certain exceptions. The social sciences are omitted except for certain works in such fields as nursing and psychology where some books which are listed are equally useful for sociological and technical information. A few small areas of technology for example the technical aspects of printing and allied arts are not covered at all and other semitechnical fields of which gardening is an example are covered less thoroughly than such fields as electrical engineering. In these semitechnical fields the editorial policy was to include the books of good quality which were turned up in the course of work on other parts of the list but not to pursue the subjects to the extent of special research.

As in the original volume the selection in most fields of knowledge is a liberal one. Throughout the selection process the aim has been to choose the books of merit among those which met the gross qualifications of date of publication, author's citizenship and availability The selections on a given subject are intended to represent the books that would be available in a well-stocked American library with an active collection in that subject. The list should be viewed as one of important

Preface

Our consultants made many valuable suggestions, both as to books which could be dropped from the lists and books which should be added.

The final selection of titles to be included was made by the Editor on the basis of his own appraisals of the books, the opinions of other reviewers as stated in published reviews and the recommendations of consultants both acknowledged and unacknowledged. The Editor is also responsible for the majority of the descriptive notes and for the final form of all of them. Careful readers of the volume will notice a "dated" flavor to some of the descriptive notes for the older books carried over from earlier volumes in our series This fault is acknowledged and the excuse for it is that the time and money were not available for rewriting all of the notes. As is customary the Editor assumes the responsibility for all the faults of selection and description, but readily and truthfully states that the good qualities of the work are the result of collaboration among the Editor his assistants the Committee, and the consultants.

Classification of scientific and technical literature is a vexatious problem which grows more difficult as areas of knowledge which once appeared to have fairly definite boundaries tend to merge with adjacent areas or to change character The basic principle followed in classifying was to place the title where it was most pertinent. However there are many instances where the Editor's judgment on points of classification was unequal to the particular problem. Furthermore, in the process of combining several lots of manuscript, galley proofs etc. some outright mistakes were made. A definite effort was made to correct these misjudgments and errors by listing the books under the right headings in the Subject Index. Users of the volume who wish to see a listing of a considerable number of associated titles on a given subject are advised to use the Table of Contents at the front of the volume while those who are looking for a single title, or a few on a specific topic will, in most instances, find it better to use the Subject Index at the end of the volume

The forms of bibliographical descriptions and abbreviations in previous volumes have drawn no complaints and, therefore, have been used again. In most cases no attention has been paid to preliminary matter included before the start of the main paging, hence the number of pages given represents the body of the book. However when two sets of pages are indicated, for example "143 21 p.," supplementary paging has been noted Illustrative material is described simply Any graphic or pictorial matter aside from printed text has been indicated by the phrase "illus" Colored illustrations have been indicated by the abbreviation "col d." Colored illustrations combined with black and white are indicated by "(part col d)" The only dimension included is height expressed in centimeters, abbreviated "cm." In our previous volumes, paper bindings were always indicated when it was known to the Editor that the books were supplied in paper covers As part of an over-all effort to control the mounting costs of preparing and printing the volume the information on paper covers has been dropped.

In most instances the information given on size pagination, imprint etc. was obtained by an examination of a copy of the book. The editor recognizes that publishers sometimes have other editions than the one described and that some of these will differ in pagination and other details of format. Imprints also were usually taken from the books and did not reflect changes in firm names location etc., that occurred after the book was printed. For this reason the places of publication and firm names given in the book descriptions sometimes differ from the information given in the Directory of Publishers at the end of the volume. In cases of discrepancy the Directory of Publishers should be followed as it was compiled later than the book descriptions.

All publishers were asked to supply the current prices of their books, and the prices listed in the book descriptions are those furnished except in a few cases where the publisher did not respond to our requests for this information or when a printer's deadline did not allow time to get it. In such cases the prices were taken from reliable sources such as the publishers own catalogs or the *Cumulative Book Index* In our earlier editions considerable attention was given to indicating special prices or additional charges made when books are sent to buyers outside the United States of America. In recognition of the fact that in these days of inflation, prices and extra charges change frequently little attention has been paid to this special price information. Most of the prices given are accurate but they are not guaranteed, and an inquiry should

and useful books rather than a list of "best" books.

Elementary and secondary school textbooks and books written on these educational levels have been excluded, but well written books for lay readers and a select number of vocational school textbooks have been included In these categories, preference has been given to books suitable for home reading and self instruction The policy on the inclusion of college textbooks has been liberalized somewhat in comparison to the policy followed in selecting titles for the original volume Again, preference has been given to the well-established texts and to those possessing useful or novel features but in selected fields such as physics, where educational interest in the subject is currently running high most of the college textbooks of merit have been included

Availability is a principal criterion for inclusion therefore books known to the Editor to be out of print or about to go out of print were not considered in making the selections Some publishers, however, supplied review copies without looking at their stocks In fact one firm wrote later that the copy supplied for review had turned out to be the last one in stock! Some books therefore, went out of print while the manuscript of this book was being prepared If the out-of print status was discovered during the "galley proof" stage of our list, the book was eliminated but if the discovery was not made until the pages had been made up the description was retained and an "o p" inserted in place of the price. A considerable number of the titles marked "o p" are publications of the United States National Government. In most instances microfilm copies of these can be obtained from the issuing agency or from the Library of Congress Washington 25 D C.

Although most American publishers cooperated wholeheartedly with the Committee and the Editor in the supplying of information and of copies of their books for examination, several ignored our requests or failed to supply examination copies. Since the editorial procedure required examination of the books a few titles are not listed because no copy was available to the editorial staff A few books were necessarily omitted because the review copy arrived too late

Selection of books for the present list began with consideration of those included in the previous volumes in our series. Publishers were queried as to whether the individual titles were in print, and if in print, whether there had been new editions. A book previously listed which was still in print was not retained as a matter of course, but it was not replaced with another title unless the other title was deemed a better book. In short, a listed title had a better chance of being retained than a title of similar age and quality not previously listed. Nevertheless the dropping of a previously listed title still in print does not necessarily signify that in the Editor's opinion it has ceased to be important or useful. Numerous titles described in the earlier volumes in our series are still in print and of value in their fields This is particularly true of the publications of learned societies Approximately 8000 titles are listed in the present volume, of which about 3500 are either new editions of titles previously listed or new titles As would be expected, books published in the 1953–1956 period predominate among the new titles

The process of selecting new titles for inclusion was essentially unchanged from our previous edition and supplements. As a first step, the Editor and his staff read the book listings and reviews in the 1953–1956 issues of the *Cumulative Book Index New Technical Books Science United States Quarterly Book List Journal of the American Medical Association* and other journals and made out slips for all of the books which appeared to be eligible These slips were arranged by publishers A statement of the purpose of the Committee's work and the general eligibility requirements was drawn up Each publisher represented in the preliminary lists was sent a copy of this statement together with the list of books published by him which appeared to be eligible The publishers were asked to eliminate any books which did not meet the Committee's general requirements for eligibility for example those by foreign authors and were asked to suggest additional titles which appeared to be eligible. Examination copies of all books to be considered were requested

When the books were received, they were examined by the Editor and his associates Books which were patently ineligible were eliminated at this stage Descriptions similar to and in many cases identical with the descriptions in the present book were prepared for the books which survived this preliminary test. Next, these descriptions were classified by subject, and many of the subject lists were sent to specialists in various fields who had agreed to act as consultants to the Committee.

Preface

Our consultants made many valuable suggestions, both as to books which could be dropped from the lists and books which should be added.

The final selection of titles to be included was made by the Editor on the basis of his own appraisals of the books, the opinions of other reviewers as stated in published reviews, and the recommendations of consultants, both acknowledged and unacknowledged. The Editor is also responsible for the majority of the descriptive notes and for the final form of all of them. Careful readers of the volume will notice a "dated" flavor to some of the descriptive notes for the older books carried over from earlier volumes in our series. This fault is acknowledged and the excuse for it is that the time and money were not available for rewriting all of the notes. As is customary the Editor assumes the responsibility for all the faults of selection and description, but readily and truthfully states that the good qualities of the work are the result of collaboration among the Editor his assistants the Committee and the consultants.

Classification of scientific and technical literature is a vexatious problem which grows more difficult as areas of knowledge which once appeared to have fairly definite boundaries tend to merge with adjacent areas or to change character The basic principle followed in classifying was to place the title where it was most pertinent. However there are many instances where the Editor's judgment on points of classification was unequal to the particular problem. Furthermore, in the process of combining several lots of manuscript, galley proofs, etc. some outright mistakes were made. A definite effort was made to correct these misjudgments and errors by listing the books under the right headings in the Subject Index. Users of the volume who wish to see a listing of a considerable number of associated titles on a given subject are advised to use the Table of Contents at the front of the volume while those who are looking for a single title, or a few on a specific topic will, in most instances, find it better to use the Subject Index at the end of the volume.

The forms of bibliographical descriptions and abbreviations in previous volumes have drawn no complaints and, therefore have been used again. In most cases no attention has been paid to preliminary matter included before the start of the main paging, hence the number of pages given represents the body of the book. However when two sets of pages are indicated, for example "143 21 p " supplementary paging has been noted. Illustrative material is described simply Any graphic or pictorial matter aside from printed text has been indicated by the phrase "illus." Colored illustrations have been indicated by the abbreviation "col d" Colored illustrations combined with black and white are indicated by (part col d)" The only dimension included is height expressed in centimeters abbreviated "cm." In our previous volumes, paper bindings were always indicated when it was known to the Editor that the books were supplied in paper covers. As part of an over all effort to control the mounting costs of preparing and printing the volume the information on paper covers has been dropped.

In most instances the information given on size, pagination imprint, etc., was obtained by an examination of a copy of the book. The editor recognizes that publishers sometimes have other editions than the one described and that some of these will differ in pagination and other details of format. Imprints also were usually taken from the books and did not reflect changes in firm names location etc., that occurred after the book was printed. For this reason, the places of publication and firm names given in the book descriptions sometimes differ from the information given in the Directory of Publishers at the end of the volume. In cases of discrepancy the Directory of Publishers should be followed as it was compiled later than the book descriptions.

All publishers were asked to supply the current prices of their books and the prices listed in the book descriptions are those furnished except in a few cases where the publisher did not respond to our requests for this information or when a printer's deadline did not allow time to get it. In such cases the prices were taken from reliable sources such as the publishers own catalogs or the *Cumulative Book Index* In our earlier editions, considerable attention was given to indicating special prices or additional charges made when books are sent to buyers outside the United States of America. In recognition of the fact that in these days of inflation prices and extra charges change frequently little attention has been paid to this special price information Most of the prices given are accurate but they are not guaranteed and an inquiry should

be made of the publisher in all cases where it is essential to have an accurate price

The headings listed under *Contents'* have been taken directly from the books When it was necessary to abridge the table of contents of a book, an effort was made to select headings which illustrate the book's scope and special features The *Note'* is designed to supplement the information obtainable from the title and table of contents, especially to bring out unusual features, to indicate uses and reader groups, and to outline the extent of changes in new editions The notes are not intended to stand alone as appraisals or descriptions but should be read in conjunction with the title and contents Some notes have been taken with little or no change from the New York Public Library's bimonthly *New Technical Books*

Various members of the Committee read and supervised long lists of tentative selections and gave valuable advice on revision of the tentative lists Prof Nathan L Drake assisted immeasurably in the selection of books on chemistry Ralph H Phelps and other members of the staff of the Engineering Societies Library revised the preliminary lists in engineering and made many valuable suggestions on titles to be added. Lt. Col Frank B Rogers and members of his staff at the National Medical Library, reviewed the entire section of medicine in its preliminary form—a fourteen pound manuscript! Mrs Henrietta T Perkins an associate of Dr John F Fulton at the Yale Medical Library is largely responsible for the new arrangement of the medical section

Equally valuable help was obtained from experts outside the Committee. Elizabeth C Hall Librarian Dr Harold W Ricketts and other members of the staff of the New York Botanical Garden applied their expert knowledge to the preliminary lists in botany and made many suggestions for deletions and additions Prof I Bernard Cohen editor of *Isis* helped—as he has done before—with the selection of books pertaining to general science and the history of science Dr David A. Jonah librarian of Brown University and Margaret E Drewett librarian in charge of the Physical Sciences Library of Brown University, reviewed the selection of titles in mathematics and are responsible for the inclusion of a number of books that had been overlooked by the Editor Prof Mark W Zemansky, Chairman of the Department of Physics of City College, gave very valuable help in preparing the section on physics. Harald Ostvold now Chief of the Reference Department of the New York Public Library and formerly librarian of the Agriculture Library of the University of Minnesota, reviewed the section on agriculture.

Jack E Brown, formerly my right hand man at the New York Public Library and now librarian of the National Research Council of Canada, aided in numerous ways in the early stages of preparing the book Of the numerous subeditorial and clerical workers who came and went during the course of preparing the book, Margaret Haas and Judith Golwyn deserve special mention for good work performed in the short time they were associated with the project Genevieve Winston was with the project for several months in its early stages and then returned toward its end to carry a major share of the office work. Throughout the life of the project Margaret Micklewright, secretary for the Science and Technology Division of the New York Public Library helped in the time she could spare from her regular duties Elizabeth Walton Hawkins served as the editor's unpaid but not unappreciated secretary and editorial assistant and, in addition, typed at least one-quarter of the manuscript.

Karl Brown formerly editor of the *Library Journal* and also of the publications of the New York Public Library carried out the task of marking copy for the printer and reading the page and galley proofs of the whole book Joseph C Borden of the University of Arkansas contributed at least five hundred descriptive notes

In an effort to reduce the time ordinarily required for preparing and printing a volume of this size, the manuscript was set in type bit by bit as it was got ready Finally the various galleys of type were combined The Lancaster Press performed a near miracle in carrying out the typesetting and combining operations with far fewer errors than were made in the editorial office where only paper had to be handled

SCIENCE

GENERAL

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

Centennial collected papers presented at the centennial celebration, Washington D. C., September 13–17 1948. Washington, D. C. American Association for the Advancement of Science, 1950 313 p. illus 27 cm. $5.00 1

Contents: Sciences of society: Is economics necessary? by K. E. Boulding. Rare civilizations in history, by A. L. Kroeber. Sociology and the strategy of social science, by [illegible]. Science and the control of human population, by W. S. Thompson. Educational potentials: Growth potentials of the human infant, by A. Gesell. The social environment of the educational process, by T. Parsons. Educability and the schools, by R. W. Tyler. Human individuality: The human frontier, by R. J. Williams. Primary mental abilities, by L. L. Thurstone. The genetic approach to human individuality, by L. H. Snyder. The individual and the culture process, by L. A. White. Environment: Agriculture and the climatic pattern of soil development, by W. A. Albrecht. Seven decades of [illegible] research, by A. C. [illegible]. Cultural contexts of [illegible] patterns, by M. Mead. Housing: Housing—where the natural and social sciences meet, by R. J. [illegible]. The contributions of science to housing, by L. W. [illegible]. Housing in the redevelopment of American cities, by C. Woodbury. World health problems: The global concept of disease, by E. C. Faust. Public health in the international scene, by L. A. Scheele. Medical research—education frontiers, by A. C. Ivy. The relevance of modern developments in nuclear energy to public health problems, by S. L. Warren. Science, psychiatry, security, by K. E. Appel. Sources of energy: Solar energy, by F. Daniels. Energy from fossil fuels, by M. K. Hubbert. Atomic energy, by E. P. Wigner. The upper atmosphere: The sun and the earth, by D. H. Menzel. The circulation of the upper troposphere and lower stratosphere, by C. G. Rossby and H. C. Willett. The world's natural resources: On living in the biosphere, by G. E. Hutchinson. [illegible] and [illegible] of [illegible] resources, by S. A. Cain. Biological problems of the oceans, by D. Merriman. Wood in an industrial world, by J. A. Hall. The exploration of mineral resources, by T. S. Lovering. Genes and cytoplasm: Genes as determiners of cellular biochemistry, by D. M. Bonner. The role of cytoplasm in heredity, by T. M. Sonneborn. The effects of changes in quantity, combination, and position of genes, by C. Stern. High polymers: Polyelectrolytes, by R. M. Fuoss. Structure and behavior of rubberlike substances, by H. M. [illegible]. Interactions of matter and radiation: The elementary particles of physics, by C. D. Anderson. Oxygen isotopes in nature and in the laboratory, by H. C. Urey. New worlds for study, by J. [illegible]. Waves and rhythms: Rhythmic behavior of the nervous system, by H. Hoagland. Sound waves and rhythms, by V. O. Knudsen.

Note: Some of the papers in the volume were published previously elsewhere, but the majority are original.

AMERICAN MEN OF SCIENCE: A BIOGRAPHICAL DIRECTORY. Edited by Jaques Cattell. Ninth edition. New York R. R. Bowker Company 1955–56. 3 v. 29 cm. $20.00 per vol. 2

[illegible]: The standard biographical directory of contemporary American and Canadian scientists. Volume I, Physical sciences, covers living scientists working in physics, mathematics, chemistry (including biochemistry), meteorology, oceanography, optics, geography, and research engineering. Volume II, Biological sciences, covers scientists engaged in botany, bacteriology, entomology, forestry, genetics, anatomy, physiology, public health, and pharmacology. Medical practitioners are not included as such but are included if they are prominent in medical research. Volume III, Social and behavioral sciences, covers psychology, geography, anthropology, sociology, etc. The total number of biographies in the three volumes is approximately 90,000. In its ninth edition the work is characterized by the same high standards of selection and accuracy as in previous editions. A noteworthy new feature is the inclusion in the third volume of tabulations with meanings of the many abbreviations used throughout the set.

BAITSELL, GEORGE ALFRED editor

The centennial of the Sheffield Scientific School. New Haven Yale University Press, 1950 206 p illus 24 cm. (Yale University Mrs. Hepsa Ely Silliman Memorial Lectures) $3.00 3

Contents: High energy physics, by E. O. Lawrence. Chemical achievement and hope for the future, by L. Pauling. Virus research—achievement and promise, by W. M. Stanley. Genes and biochemical reactions, by G. W. Beadle. Changes by honorary degrees, by [illegible]. The Sheffield Scientific School from 1847 to 1947, by C. H. Warren. Science and the [illegible], by [illegible]. Benjamin Silliman in his [illegible] moments, by J. F. Fulton. Greetings, by C. Seymour. The relationship of the Sheffield School to [illegible], by [illegible]. Centennial greetings to the Sheffield Scientific School from Sigma Xi, by G. A. Baitsell.

Note: The first four papers in this volume constitute the twenty-sixth series of the Mrs. Hepsa Ely Silliman Memorial Lectures. They are addressed primarily to educated laymen, and they summarize significant recent advances in several scientific fields. The rest of the volume consists of special addresses on the occasion of the Centennial of the Sheffield Scientific School, the establishment of which in 1847 marked "the acceptance of science in America as an important and necessary part of education and of life in general."

BAITSELL, GEORGE ALFRED editor

Science in progress. First series. New Haven Yale University Press 1939 322 p. illus. 24 cm. (The Society of the Sigma Xi National lectureships 1937 and 1938) $5.00. 4

Contents: Foreword, by H. Shapley. Atoms, new and old, by E. O. Lawrence. The separation of isotopes and their use in chemistry and biology, by H. C. Urey. Recent advances in the study of viruses, by W. M. Stanley. New vistas in virus disease research, by L. O. Kunkel. Vitamins and hormones, by [illegible]. The essential use of vitamins in living things, by R. R. Williams. Internal secretions in reproduction, by E. Allen. Recent developments in our knowledge of chromosome structure and their application to genetics, by T. S. Painter. Electrical potentials of the human brain, by E. N. Harvey. Animal metabolism: From mouse to elephant, by F. G. Benedict. References. Index.

—— Science in progress. Second series. New Haven Yale University Press 1940. 317 p. illus. 24 cm. (The Society of the Sigma Xi. National lectureships, 1939 and 1940) $5.00 5

Contents: The experimental alteration of heredity, by L. J. Stadler. The regulation of plant growth, by F. W. Went. Experimental studies on the functions of the frontal lobes in monkeys, chimpanzees, and man, by J. F. Fulton. Mysterious craters of the Carolina coast: A study in methods of research, by D. Johnson. How the earth shows its age, by A. C. Lane. The expanding universe, by H. P. Robertson. Cosmic rays and new elementary particles of matter, by C. D. Anderson. The motions of ions and proteins in electric fields, by D. A. MacInnes. The ultra-centrifuge, by J. W. Beams. Recent advances in astronomy, by J. C. Hunsaker. References. Index.

—— Science in progress. Third series New Haven Yale University Press 1942 322 p illus 24 cm (The Society of the Sigma Xi National lectureships, 1941 and 1942) $5 00 6

Contents Foreword, by W R. Whitney Galaxies, by H. Shapley The problem of the expanding universe, by E. Hubble. Energy production in stars, by H. A. Bethe. Image formation by electrons, by V K. Zworykin. Recent work in the field of high pressures, by P W Bridgman. Recent developments in power generation by L. S. Marks. Some fundamental aspects of photosynthesis, by J Franck The structure of liquids, by J G Kirkwood. The mode of action of sulfanilamide, by P H. Long. Some scientific aspects of the synthetic rubber problem, by H. Mark. References. Index.

—— Science in progress Fourth series New Haven Yale University Press, 1945 331 p illus 24 cm. (The Society of the Sigma Xi. National lectureships, 1943 and 1944) $5 00 7

Contents Preface, by G. A. Baitsell. Foreword, by L. L. Woodruff Illustrations. Psychological aspects of military aviation, by W R. Miles. The physical structure and biological action of nerve cells, by D W Bronk. Energy and vision, by S. Hecht. Chemical transmission of nerve impulses, by O Loewi. The mathematical nature of physical theories, by G. D Birkhoff The magnetic approach to the absolute zero of temperature, by P Debye. The drift toward equilibrium by H. Eyring. Streams of atoms, by I. I. Rabi. Adventures in vacuum chemistry by K. C. D Hickman. Present status of the vitamin B complex, by C. A. Elvehjem. Blood and blood derivatives, by E. J Cohn. References. Index.

—— Science in progress Fifth series New Haven Yale University Press, 1947 353 p illus. 24 cm. (The Society of Sigma Xi National lectureships, 1945 and 1946) $5 00 8

Contents: Preface, by G. A. Baitsell. Illustrations. Introduction The future of scientific research in the postwar world, by F B. Jewett. The interior of the earth, by J B. Macelwane. Development of betatron and applications of high-energy radiations, by D W Kerst. Contact catalysis between two world wars, by H. S. Taylor Fundamentals of oxidation and respiration, by L. Michaelis. Complement Immunity intensifier diagnostic drudge, chemical curiosity by M. Heidelberger Genes and the chemistry of the organism by G. W Beadle. Concerning the cancer problem, by P Rous. Plant diseases are shifty enemies, by E. C. Stakman Living cells in action by C. C. Speidel. Recent advances in our knowledge of the anterior pituitary hormones, by H. M Evans. References. Index.

Contents The first heart beats and the beginning of embryonic circulation by B M. Patten. The reproductive cycle of the rhesus monkey by G. W Corner Human infancy and the embryology of behavior by A. Gesell. Radiation damage to the genetic material, by H. J Muller Beyond the gene—two years later by T M. Sonneborn The macromolecular structure of biological materials, by R. W G Wyckoff The elementary particles of physics, by C. D Anderson Atomic and solar energy by F Daniels. Atomic structure and energy by J R. Dunning. The theory of braids, by E. Artin. History of the fauna of Latin America, by G G. Simpson. The physical chemistry of polymers, by R. M. Fuoss. References. Index.

—— Science in progress Eighth series New Haven Yale University Press, 1953 285 p illus. 24 cm (The Society of the Sigma Xi National lectureships, 1951 and 1952) $6 00 11

Contents: Preface, by G. A. Baitsell. The origin and evolution of the universe, by G. Gamow Unsolved problems of the sun's atmosphere, by W O Roberts. The earth's atmosphere, by J Kaplan. The geological history and evolution of insects, by F M. Carpenter Africa and the origin of man, by D M. S. Watson. Sensory physiology and the orientation of animals, by D R. Griffin. Cooperation and conflict among primitive organisms, by Paul R. Burkholder Luminescent organisms, by E. N Harvey Microwave spectroscopy by C. H. Townes. Molecular interactions in protein solutions, by G. Scatchard. References. Index.

—— Science in progress Ninth series New Haven Yale University Press, 1955 343 p illus 24 cm (The Society of the Sigma Xi National lectureships, 1953 and 1954) $6.50 12

Contents Preface, by G A. Baitsell. Present knowledge of human heredity and its applications, by L. H. Snyder Two or three bristles, by C. Stern. The significance of auxins in agricultural practice, by E. J Kraus. The physiology of growth in plant tissues, by K. V Thimann. The molecular basis of visual excitation by G. Wald. The impact of nuclear science on medicine, by L. E. Farr Nuclear magnetism by F Bloch. Transistor physics, by W Shockley Suspension bridges—the aerodynamic problem and its solution by D B Steinman Color and chemical constitution, by W R. Brode. References. Index.

Note. Each volume of this series contains papers developed from lectures delivered under the sponsorship of the Society of the Sigma Xi at leading American universities. The purpose is to enable outstanding scientists to report on the progress being made in various fields of scientific research and to describe their own recent work. The topics are diversified, but there is some emphasis on the biological sciences. The authors have written primarily for audiences of trained scientists, but some of the papers have appeal for mature laymen who are versed in scientific terminology and basic concepts.

BENNETT, JESSE LEE

The diffusion of science. Baltimore The Johns Hopkins Press, 1942 141 p 22 cm. $2.25 13

Content The great and sudden world changes. The knowledge of the past and the agencies for diffusing it. The new scientific knowledge and the evolving agencies for diffusing it. The growing realization of the changed situation. The need for broad view scientific method, and definite plan. The possible aims of the education of the future. The possible material of the education of the future. The possible technique of the education of the future. Immediate possibilities. Notes.

Note A plan and program for the diffusion of scientific knowledge based upon a broad study of the world situation, of the existing educational philosophy and educational systems, of the new devices of intercommunication, and of possible methods of deliberate and conscious procedure in a field in which existing activities are, in the author's view largely empirical and pragmatic Emphasis is placed on the application of the scientific method to the problem of the advancement and diffusion of science.

BURCHARD, JOHN ELY editor

Mid-century—the social implications of scientific progress Verbatim account of the discussions held at the Massachusetts Institute of Technology on the occasion of its mid

century convocation March 31 April 1 and April 2 1949 Cambridge, Mass Published jointly by The Technology Press of the Massachusetts Institute of Technology and John Wiley & Sons, Inc., New York, 1950. 549 p 23 cm. $7.50. 14

Contents The state of science. The twentieth century. Man against nature. Man against man. Science, materialism and the human spirit. The role of the individual in a world of institutions. The problem of specialization in twentieth century education. The state, industry and the university. The shape of the future. The obligations and ideas of an institute of technology. Appendices. Biographical notes. Index.

Note In this book some 35 contemporaries who are famous for their work in science or in other fields, such as politics, discuss matters which are more or less related to the impact of science upon our society. There is some emphasis, but not an overwhelming amount, on the special contributions and problems of universities. The speeches themselves are copiously supplemented by comments from the editor and others.

BUSH VANNEVAR

Endless horizons. Introduction by Dr Frank B Jewett. Washington, D C. Public Affairs Press, 1946 182 p. 23 cm. $2.50 15

Contents The inscrutable past. As we may think. A program for tomorrow. The war against disease. The public welfare. Renewal of scientific talent. Reconversion opportunities. The means to the end. Research on military problems. The control of atomic energy. Research and the war effort. The teamwork of technicians. The qualities of a profession. Our tradition of opportunity. The need for patent reforms. Science for world service. The builders.

Note A collection of essays and addresses, most of which were published or delivered in 1945. Six of them are reprinted from the author's *Science, the endless frontier*, a report to the President, Washington, D C 1945. All of the volume is worth reading, but the most important parts deal with the role of research in the United States during World War II, and a proposed program for the support of scientific research by the national government in peacetime. The author was the Director of the Office of Scientific Research and Development during World War II.

CHRISTMAN RUTH C. editor

Soviet science. A symposium presented on December 27 1951 at the Philadelphia meeting of the American Association for the Advancement of Science Arranged by Conway Zirkle and Howard A. Meyerhoff Published with the aid of a grant from the National Science Foundation Washington D C. American Association for the Advancement of Science, 1952 108 p. 24 cm. $1 75 16

Contents Russian genetics, by T. Dobzhansky. Russian physiology and pathology, by W. H. Gantt. Russian psychology and psychiatry, by I. D. London. Scientific method and social science: East and West, by R. L. Ackoff. Russian contributions to soil science, by J. S. Joffe. Soviet physics and chemistry, by J. Turkevich. Soviet mathematics, by J. R. Kline. Science and intellectual freedom in Russia, by L. Volin. An appraisal of science in the USSR, by C. Zirkle.

Note The emphasis in this work is on Soviet science in our times; however, most of the papers include references to earlier times and especially to Russian scientists who made great contributions to their field. Relationships between Soviet politics and Soviet science today are discussed. Contemporary journals and scientific institutions are mentioned.

COHEN I BERNARD AND FLETCHER G WATSON editors

General education in science. With a foreword by James Bryant Conant. Cambridge Mass. Harvard University Press 1952 217 p. 22 cm. $4.00 17

Contents Science for the nonscientist: Science and the layman, by R. J. Dubos. General education and special education in the sciences, by A. J. French. The assimilation of science into general education, by P. B. Sears. The philosophy of science and the teaching of science: The role of philosophy in a general education course in physical science, by E. C. Kemble. What teachers of general education courses in the sciences should know about philosophy, by P. Frank. The history of science and the teaching of science: The history of science and the teaching of science, by I. B. Cohen. The use of historical cases in science teaching, by L. K. Nash. Acquiring a knowledge of the history of science, by F. G. Kilgour. The sciences in a technical civilization: Applications of science and the teaching of science, by P. Le Corbeiller. What the layman needs to know about science, by S. A. Goudsmit. Education for citizenship in a technical civilization, by E. C. Fuller. Some problems in the teaching of biology: An approach to the teaching of biology to nonscientists, by E. S. Castle. The general education course in biology—laboratory work and general objectives, by G. E. Erikson. The evaluation problem: Can general education courses in the sciences be evaluated? by H. S. Dyer. What the instructor can do about evaluation—techniques and examples, by F. G. Watson.

Note Papers which were originally presented at the Workshop in Science in General Education held at the Harvard Summer School in July 1950, are collected in this volume. Their purpose cannot be described better than in the words of Dr. Conant: A major educational problem that now confronts those concerned with teaching science is how to start the student down a road that will insure his arriving at some degree of scientific literacy even though he devotes his college years to the study of some nonscientific subject. This is the problem to which the papers collected in this volume are primarily addressed.

COHEN I. BERNARD

Science servant of man a layman's primer for the age of science. Boston Little Brown and Company, 1948 362 p illus 21 cm. $5 00 18

Contents (abridged) Part I, The nature of the scientific enterprise: Conditions of scientific discovery. The "happy accident" and its consequences. The spectrum of scientific activity. Part II, Practical applications of fundamental research: Atoms and agriculture. The electric current and radio. Synthetic rubber and nylon. Part III, Fundamental research in which a practical application seems likely: Blood groups and blood transfusion. The story of hybrid corn. The fortune at the rainbow's end. Part IV, Practical innovations based on existing fundamental knowledge: Microbiology and oil prospecting. The [illegible] camera and radar communication. Part V, Science, servant of man: How to get the most out of science. Bibliography. Index.

Note In this interesting and well-written book the "road" of fundamental scientific research is demonstrated by recounting the origins and development of some of the important applications of scientific knowledge that we now enjoy. In most of the cases it is shown that the original investigation was undertaken with no other motive than to add to the sum of human knowledge. Also, it is shown that considerable time usually elapses between the original discovery and its practical application, and that in this interval a number of scientists usually make contributions that increase the knowledge of the fundamental principles involved. The author's main purpose is to convince the general reader that pure science does eventually add to his well-being, and a collateral aim is to explain the methods of basic scientific research. The book can be read with profit by both laymen and scientists.

COLEMAN HARRY SHIPP editor

Laboratory design National Research Council report on design, construction, and equipment of laboratories. With an introduction by Roland Wank. New York Reinhold Publishing Corporation, 1951 393 p. illus. 30 cm. $15.00 19

Contents (abridged) Part I, Materials, facilities, services and equipment—general discussion: Introduction, by R. A. Wank. Interior construction materials, by E. M. Jenkins. Plumbing, by J. E. York. Laboratory lighting, by J. L. Tugman. Electric power, by J. M. Eaton. Laboratory ventilation, by W. C. L. Hemeon. Safety precautions, by F. A. Van Atta. Part II, Teaching laboratories: Site selection, design and construction, by H. F. Lewis. The general science building, by W. A. Morand. The analytical chemistry laboratory, by E. J. Meehan. The organic chemistry laboratory, by C. D. Hurd. The physical and electrochemical laboratory, by L. O. Case. Biochemical and related laboratories, by A. A. Christman. The chemical engineering laboratory, by C. C. Winding. The metallo-

graphic laboratory by R. C. Ernst and G. C. Williams. Part III, *Industrial laboratories* Details and description of an analytical control laboratory by B L. Clark and others. Metallurgical laboratories, by H. K. Work, Animal rooms and equipment, by C. F Carpenter Industrial laboratories for physical measurements, by H. P Klug. The design of laboratories for the safe handling of radioisotopes, by M. B Hawkins. Constant-temperature-humidity rooms, by M. E. Dunlap. High-pressure laboratories, by R. L. Savage. Pilot plant laboratories, by W L. Faith. Part IV Concise descriptions of some modern laboratories Illinois Institute of Technology Laboratory by M. Kilpatrick. Reed College Laboratory by A. F Scott. Battelle Memorial Institute research buildings, by W A. Welcker Jr M llon Institute research laboratories, by H. S. Coleman. Bell Telephone Laboratories, by C. S. Haines. Johns-Manville Research Center by E. M. Jenkins. Esso Research Center—Industrial Laboratory by W R. Hoot. B F Goodrich Research Center by D H. Cornell. Selected bibliography Index.

Note. An authoritative and comprehensive reference book on modern teaching and research laboratories. The book is of interest to all scientists whose work includes responsibility for laboratory organization or direction and t engineers and architects interested in the design and construction of laboratories. The descriptions of specific modern laboratories in the fourth part are brief but they are supplemented by many excellent pictures.

CONANT, JAMES BRYANT

Modern science and modern man New York Columbia University Press, 1952 111 p 21 cm (Bampton lectures in America. Number 5) $2.25 20

Content Science and technology in the last decade. The changing scientific scene, 1900–1950. Science and human conduct. Science and spiritual values.

Not A book presentation of the four Bampton lectures delivered at Columbia University in 1952 In it the author outlines the fundamental changes which have occurred in scientific knowledge since 1900, then discusses the philosophical and spiritual implications of this new insight into the nature of the universe. Although of interest to scientists, the book is addressed more to educated people in other fields.

CONANT, JAMES BRYANT

Science and common sense New Haven Yale University Press, 1951 271 p 21 cm. $5 00 21

Contents Science and the American citizen. What is science? Concerning the alleged scientific method. The development of the concept of atmospheric pressure. Some recurring patterns in experimental inquiry Geometrical reasoning and quantitative experimentation. The origin of conceptual scheme the chemical revolution. The study of living organisms; natural history and experimental biology Experiment and observation in biology Illustrations from the controversy concerning spontaneous generation. The study of the past. The impact of science on industry and medicine. Science, invention, and the state. Bibliography Index.

Note The author' *On understanding science*, 1947 was primarily proposal for new program of teaching the meaning of science to college students preparing for work in law journalism, and other nonscientific fields. The present book is addressed to the lay reader and, although some material from *On understanding science* has been included, the pedagogy has been left out. The subject is mainly "the tactics and strategy of science, and the discussion includes accounts of case histories, such as Boyle's experiments with atmospheric pressure, Roentgen's discovery of X-rays, etc. In the last two chapters the author turns to the social aspects of modern science showing that science is major and essential part of the present-day social fabric.

EMBERGER META RILEY, AND MARIAN ROSS HALL

Scientific writing General editor W Earl Britton New York Harcourt, Brace and Company, 1955 468 p illus 22 cm $4 50 22

Content Scientific method. The problem concept. Definition and terminology Collecting data. Analysis—methods and applications. Interpretation—applying the principles of logic. Directing the paper to the reader Scientific style. Techniques of exposition The research paper. The report. Special types of papers. The format of the scientific paper. Graphic and pictorial illustration. Appendixes. Index.

Note A textbook addressed primarily to college students. The first six chapters constitute an elementary introduction to the methods of science. The remaining chapters deal with problems that are fundamental to the preparation of good scientific reports and other types of scientific papers, including abstracts and book reviews. Selected examples of actual scientific writings of the various types discussed are included. Although organized primarily for formal instruction and study the book contains some reference features, including literature citations and a detailed index.

FORTUNE

The mighty force of research by the editors of *Fortune* New York McGraw Hill Book Company, Inc., 1956 308 p illus. 20 cm. $4 00 23

Content The strange state of American research, by E. Hodgins. The young scientists, by F Bello. Science for sale, by H. Solow The long-range planners, by M. M. Hunt. The inventor in eclipse, by E. L. Van Deusen. New light on the brain, by F Bello. How are we fixed for water? by F Bello. Tomorrow's weather by F Bello. Faraday's chemical art, by E. Hodgins. Power from the sun, by E. Hodgins. The peaceful atom, by F Bello. The new Metals Age, by L. P Lessing. The transistor by F Bello The automatic factory by F Bello. The information theory by F Bello. Index.

Note. These articles appeared originally in the journal, *Fortune*, between January 1953 and August, 1955 They were there printed and are here reprinted as description of the contemporary status of pure and applied research in the United States of America, where expenditures for the purpose have more than quadrupled in 15 years. The first five chapters provide general introduction to modern scientific research. The remaining 10 chapters focus upon specific problems and areas of inquiry Although written in popular style, the articles are based upon extensive researches and merit reading by industrialists and scientists.

GAMOW, GEORGE

One two three infinity facts & speculations of science. Illustrated by the author New York The Viking Press 1947 340 p illus 22 cm. $4 75 24

Contents: Part I, Playing with numbers: Big numbers. Natural and artificial numbers. Part II, Space, time & Einstein U usual properties of space. The world of four dimensions. Relativity of space and time. Part III, Microcosmos. Descending staircase. Modern alchemy The law of disorder The riddle of life. Part IV Macrocosmos Expanding horizons. The days of creation. Index.

Note At first glance this book appears to be a miscellany However the fact that the chapters could be easily classified as essays on topics in mathematics, physics, astronomy and biology is beside the point, for the purpose of the book is to impart knowledge about modern science as whole. It can be read either as supplement to the author's *The birth and death of the sun*, 1940, 238 p., and *Biography of the earth*, 1941 New York, The Viking Press, 242 p., or separately The author' style is intriguing, humorous and easy to understand. If some parts of the work (for example, "The law of disorder") require more concentrated thinking than one expects in a popular book, that is the fault of the subject rather than the diction. The author's own drawings contribute clarity and humor

HILLWAY TYRUS

Introduction to research. Boston Houghton Mifflin Company 1956 284 p 22 cm. $3 50 25

Contents: Part I, Research and graduate study The role of research in man's rise from barbarism. The graduate student and his opportunities. How the graduate school came into being. Part II The ways of scholarship The scholar as detective—the rules of evidence—the search for clues. The three types of research. Selecting the problem for investigation. The hypothesis—what is it? Part III, Investigative techniques Some common sense about techniques of research. Documentary research. Experiment. The survey The language of statistics. The case study The role of accident in research. Part IV Presenting the results of research. Preparing the written report. Publication—the ultimate goal. The question of originality Selected bibliography Index.

General

Note: Written primarily to orient first-year graduate students about to undertake their first research projects, this book provides a general, elementary introduction to the purposes and methods of scientific research. The beginnings of graduate study in the United States of America are outlined, then the problems and techniques of searching out information, evaluating it, and preparing it for publication are discussed at some length. Research in the biological and physical sciences is not emphasized. In fact, there is some bias toward the social sciences. However, students in the biological and physical sciences who are planning to do graduate study or research in the United States of America will find much that is helpful in the book.

HOUGH, JOHN N.

Scientific terminology. New York, Rinehart and Company Inc. 1953. 231 p. 21 cm. $3.75 26

Contents: Introduction. The Greek and Latin alphabets. Formation of English words—roots, stems, combining forms. Formation of English words—suffixes. Formation of English words—prefixes. General scientific vocabulary. Latin forms and Latin grammar in scientific nomenclature. Medical and pathological vocabulary. Bacteriological nomenclature. Pharmaceutical terminology. Biological terms. The Linnaean system of biological nomenclature. The reading and writing of Latin descriptions. Index.

Note: A helpful book for any student preparing for a scientific career and a useful reference book for libraries. It takes the mystery out of the Latin- and Greek-derived vocabulary of the medical and biological sciences and provides tools for understanding the Basic Nomina Anatomica. It is neither a dictionary nor a glossary but an exposition of the sources of scientific terms and of how the words are put together. Various word lists of considerable length are of course included. Although there is a chapter on scientific vocabulary, which the author says is applicable to all branches of science, the emphasis is on the biological and medical sciences, and the student of electrical engineering, for example, will get little help from the book.

KNAPP, ROBERT HENRY, AND H. B. GOODRICH

Origins of American scientists: a study made under the direction of a committee of the faculty of Wesleyan University. Chicago, The University of Chicago Press, 1952. 450 p. illus. 25 cm. o.p. 27

Contents (abridged): The undergraduate origins of American scientists. The indexes of production of scientists. The design of the statistical study. The analysis of the college sample. The analysis of the university sample. The design of the case study. Four institutions of broad intellectual emphasis: Reed, Swarthmore, Oberlin, and Antioch. Five men's liberal arts colleges: Amherst, Haverford, Wabash, Wesleyan, and Williams. Western liberal arts colleges of distinguished performance: Central, Colorado, Cornell, Earlham, Kalamazoo, Marietta, and Whitman. Two prosperous colleges of superior achievement: Pomona and DePauw. Two colleges of [illegible] constituency: Hope and St. Olaf. Two liberal arts colleges of special interest: Iowa Wesleyan and Linfield. The statistical analysis of departmental ratings. The distinguished teacher. Summary of findings. Speculations and interpretations. Conclusions. Appendices. General index. Index of institutions.

Note: The findings of a systematic study of the educational origins of American scientists and of other factors which led them to choose scientific careers are reported in this book. It is based on a statistical assessment of the records of 490 universities and colleges in the production of scientists. Twenty-two selected liberal arts colleges—named in the chapter titles—were the subjects of special study and firsthand investigation. The study was conducted under the joint sponsorship of the Carnegie Foundation and Wesleyan University under the direction of the Committee on Education of Scientists of Wesleyan.

LIFE

The world we live in. By the editorial staff of *Life* and Lincoln Barnett. New York, Time Inc., 1955. (Distributed by Simon & Schuster Inc., N. Y.) 304 p. illus. (part col. d) 35 cm. $13.50. 28

Contents: Introduction. The earth is born. The miracle of the sea. The face of the land. The canopy of air. The pageant of life. The age of mammals. Creatures of the sea. The coral reef. The land of the sun. The arctic barrens. The rain forest. The woods of home. The starry universe. List of illustrations. Bibliography. Index.

Note: Published in this volume is a work that appeared originally as a planned series of articles in the journal *Life* from December 8, 1952 to December 20, 1954. Preparation of the series was a collaborative effort of the various members of the journal's staff. The narrative text was written by Lincoln Barnett, and it is addressed to mature general readers. The text is supplemented by a remarkable series of illustrations, some of which are reproduced from photographs and others from original paintings. The majority of illustrations are reproduced in color. As the chapter titles indicate, the main topic is the surface of the earth, and the life that lives on it. However, the earth is presented as a member of the solar system, and in turn of the universe. The book is not a systematic coverage of either astronomy, geology or biology, but it does convey the majesty and variety of the earth as a planet, and it contains some very remarkable illustrations, some of which hold as much fascination for professional scientists as for laymen.

MEIER, RICHARD L.

Science and economic development: new patterns of living. New York, Published jointly by the Technology Press of Massachusetts Institute of Technology and John Wiley & Sons Inc., 1956. 266 p. illus. 24 cm. $6.00 29

Contents: The present world predicament. New foods. New fuels. New patterns of living. Recapitulation. Appendix: Problems in fundamental science. Problems in applied research. Index.

Note: A carefully prepared appraisal of the greater needs of the human population of the world and of the paths that should be followed in science and technology to fulfill them. It is based on the latest available information on such matters as the nutritional requirements of human beings, the economics of the direct utilization of solar energy, and rates of population increase. Neither catastrophic nor utopian conclusions are drawn, but drastic revisions in patterns of living and utilization of the earth's resources are foreshadowed. The theme of the book is more sociological than technological. Nevertheless, it contains much material of interest to engineers who are interested in the social potentials of science and engineering.

NATIONAL ACADEMY OF SCIENCES—NATIONAL RESEARCH COUNCIL

Scientific and technical societies of the United States and Canada. Sixth edition. Part I, Scientific and technical societies of the United States, compiled by the Library, National Academy of Sciences—National Research Council. Part II, Scientific and technical societies of Canada, compiled by John R. Kohr, National Research Council, Canada. Washington, D. C., National Academy of Sciences—National Research Council, 1955. 447 p. 26 cm. $7.50. 30

Contents: Part I, Scientific and technical societies of the United States. Part II, Scientific and technical societies of Canada. Indexes.

Note: In the 27 years since the publication of the first edition, this work has gained complete recognition as the standard directory and source of current information on the societies within its scope. It furnishes such information about each society as: official name, address, names of officers, history, purpose, number and classes of members, frequency of meetings, titles and subscription rates of publications. This information is supplied by officers of the societies themselves, and for this sixth edition was furnished between June and December 1954. Omission of the word "Institutions" from the title of this edition is significant. It reflects the fact that certain types of organizations, such as trade associations, formerly included if they carried on research activities, have been dropped. An example of such an omission is the Edison Electric Institute.

NATIONAL RESEARCH COUNCIL

International critical tables of numerical data, physics, chemistry and technology prepared under the auspices of the International Research Council and the National Academy of Sciences by the National Research Council of the United States of America, editor in chief Edward W Washburn, associate editors Clarence J West and N Ernest Dorsey New York Published for the National Research Council by the McGraw Hill Book Company, Inc, 1926–30 7 v illus 28 cm. Vol I, $17 00 vol. II, $21 00, vols III–VI, $17 00, vol VII, $18 00 Set with index, $130 00 31

—— Index. Volumes I–VII Compiled by Clarence J West, with the collaboration of Callie Hull. New York Published for the National Research Council by the McGraw Hill Book Company, Inc., 1933 321 p 28 cm $15 00 32

Note A compilation of tables collected and critically evaluated by some 300 experts, including chemists, physicists, and engineers of the United States of America, Canada, Great Britain Belgium France, Italy Austria, Germany Denmark, Switzerland, Holland, Australia and Japan. Briefly stated, the purpose of *International critical tables* is to present the most reliable available quantitative information f the following types (1) the mechanical thermal, chemical, thermodynamic, electric, magnetic, optical, and acoustical properties of pure substances and of solutions and mixtures both for the crystalline the liquid, and the gaseous stat and for combinations of two or more of these states, (2) the same and other properties for great variety of industrial products and natural materials, (3) various characteristics of the earth and the solar and sidereal system and its members, and (4) umerical data relating to instruments, apparatus, laboratory technique or operations, and control of laboratory or factory conditions.

NEWMAN, JAMES R, editor

What is science? Twelve eminent scientists and philosophers explain their various fields to the layman New York Simon and Schuster, Inc. 1955 493 p illus. 21 cm $4 95 33

Contents Introduction by J R. Newman. Science and human lif by B Russell. Mathematics and logic, by E. T Whittaker Astronomy and cosmology by H. Bondi. Physics, by E. U Condon. Chemistry by J Read. Biochemistry by E. Baldwin. Biology by W C. Allee. Evolution and genetics, by J Huxley Psychology by E. G. Boring. Anthropology by C. Kluckhohn. Psychoanalysis, by E. Fromm. Science as foresight, by J Bronowski. Bibliography Index.

Note A collection of original essays written specifically for this volume, rather than an anthology of previously published writings. Although addressed to lay readers, as indicated in the title the essays are not extreme popularizations. Technical terminology is used rather freely and the ideas discussed have not all been selected for simplicity Nevertheless, educated general readers curious about the implications of science find the book rewarding reading. The 11 essays or chapters are preceded by biographical sketches of the authors written by the editor

OPPENHEIMER, J ROBERT

Science and the common understanding New York Simon and Schuster 1954 120 p 21 cm $2 75 34

Contents: Newton—the path of light. Science as action—Rutherford's world. A science in change. Atom and void in the third millennium. Uncommon sense. *The sciences and man's community* Appendixes.

Note Six lectures delivered as the Reith Lectures in November and December 1953 over the Home Service of the British Broadcasting Corporation have been published in this book, along with the full texts of passages from noted works f science from which the author quoted briefly in the lectures, and a short list of books and monographs on atomic theory The author has described the lectures as an attempt to elucidate what there is new in atomic physics that is relevant and inspiriting for men to know In style devoid of mathematics, and in terminology comprehensible to most educated lay readers, he throws light on certain fundamental concepts and phenomena of atomic physics, and makes clear their significance in the structure f human knowledge.

PORTERFIELD, AUSTIN L.

Creative factors in scientific research a social psychology of scientific knowledge, studying the interplay of psychological and cultural factors in science with emphasis upon imagination. Durham, N C Duke University Press, 1941 282 p 24 cm. (Duke University Press. Sociological series No 3) $3.50 35

Contents Introduction Problem and perspective. Part I, Cultural factors in science: The emergence of science in the social process. Cultural factors in scientific concepts and methods. Part II, Psychological factors in science: The meaning and significance of imagination. Flashes of insight in artist, inventor and scientist, and grounds out of which new figures emerge. Imagination in scientific investigation. Part III, The interplay of psychological and cultural factors in some creative leaders in science A creative leader in physical science Galileo Galilei. A creative leader in the science of life Charles Darwin. Creative leaders in the science of society Auguste Comt and a century of his successors. Part IV Creative factors and trends in the study of personality and society—implications for social control: *Psychology and culture in the study of personality* Recent trends in sociology sociological insight, and social control. Index.

Note A critique of scientific methods, useful to social scientists in every field, and not without interest to biologists and physical scientists. The study develops social psychology of scientific endeavor by *studying the interplay of psychological and cultural factors in the development of science. It shows how the assumptions of the* scientist are related to his cultural backgrounds and demonstrates the dependence of his techniques upon his methodological assumptions, indicates "that culture itself is the product of creative insight, and requires the same mental processes for its study and interpretation as were originally required for its origination and development emphasizes the fact "that the dynamic factor in research consists in the creative control of observation, *experimentation, and reasoning.* It illuminates its principles by drawing them out of and applying them to concrete materials.

ROE, ANNE

The making of a scientist. New York Dodd, Mead & Company, 1953 244 p illus. 22 cm $3 75 36

Contents How this research study developed. How the study got under way The year's work with physical scientists. The year's work with social scientists. *Social description of the 64 subjects.* The family backgrounds. *Growing up.* Becoming biologist. Becoming physicist. Becoming social scientist. How scientists think. How smart are scientists? *What kind of stories do they tell? What do they see in inkblots? The subsidiary study* What does it mean for you?

Not A popular account of an intensive study by professional psychologist of group of 64 professional research scientists. It is written for reading by others than psychologists, and it explains in an elementary and introductory way the origin of the projects, its purpose, its technique, *and its findings.* It throws much light on the educational and environmental backgrounds of scientists, or at least of this group of scientists and it also introduces the reader to contemporary techniques of psychological testing. The presentation includes no mathematics, only few tables, and no *literature references.*

SCIENTIFIC AMERICAN

Scientific American reader New York Simon and Schuster 1953 626 p illus. 24 cm. $6 00 37

General

Contents: Evolution in space: Galaxies in flight, by G. Gamow. The milky way, by B. J. Bok. The universe from Palomar, by G. W. Gray. The dust cloud hypothesis, by F. L. Whipple. Radio stars, by A. C. B. Lovell. Structure of the earth: The crust of the earth, by W. H. Bucher. The earth's heat, by A. E. Benfield. Volcanoes, by H. Williams. Structure of matter: The ultimate particles, by G. W. Gray. The multiplicity of particles, by R. E. Marshak. The structure of the nucleus, by M. G. Mayer. Radio waves and matter, by H. M. Davis. The solid state, by G. H. Wannier. Atomic energy: Atomic power, by L. Ridenour. Reactors, by L. R. Hafstad. The energy of stars, by R. E. Marshak. The hydrogen bomb, by L. N. Ridenour and H. A. Bethe. Tracers, by M. D. Kamen. Origin of life: Photosynthesis, by E. I. Rabinowitch. Proteins, by J. S. Fruton. Enzymes, by J. E. Pfeiffer. Calcium and life, by L. V. Heilbrunn. Genetics: The genes of men and molds, by G. W. Beadle. The chemistry of heredity, by A. E. Mirsky. The genetic basis of evolution, by T. Dobzhansky. Cataclysmic evolution, by G. L. Stebbins, Jr. Lethal heredity, by W. F. Hollander. The mystery of corn, by P. C. Mangelsdorf. The virus: The virus, by F. M. Burnet. The multiplication of viruses, G. S. Stent. Natural history of a virus, by F. and E. Marriott. A new era in polio research, by J. L. Melnick. The common cold, by C. H. Andrewes. Stress: ACTH and cortisone, by G. W. Gray. The pituitary, by C. H. Li. The alarm reaction, by P. C. Constantinides and N. Carey. Schizophrenia and stress, by H. Hoagland. Animal behavior: The army ant, by T. C. Schneirla and G. Piel. The language of the bees, by A. Krogh. The spider and the wasp, by A. Petrunkevitch. The curious behavior of the stickleback, by N. Tinbergen. Experimental neuroses, by J. H. Masserman. Origin of man: The antiquity of modern man, by L. C. Eiseley. The ape-men, by R. Broom. The scale of evolution, by W. M. Krogman. Man's genetic future, by C. Stern. Is man here to stay? by L. C. Eiseley. The brain and the machine: The great ravelled knot, by G. W. Gray. Mathematical machines, by H. M. Davis. Feedback, by A. Tustin. A chess-playing machine, by C. Shannon. Imitation of life, by W. G. Walter. Sensation and perception: Eye and camera, by G. Wald. Smell and taste, by A. J. Haagen-Smit. Experiments in perception, by W. H. Ittelson and F. P. Kilpatrick. What is pain? by W. K. Livingston. Index.

Note: A selection of articles originally published in the periodical, *Scientific American*, during the years 1948–1952, is published in the book. The articles represent some of the best reporting and interpreting in the United States of America of the advance of science in the years covered. The parent periodical is edited for lay readers and scientists reading outside the fields of their own specialties. The collected articles are, of course, suitable for similar audiences. Readers of Scientific American know that one of its outstanding features is striking and scientifically accurate illustrations. However only a few of the illustrations that accompanied the articles in the original publication have been reproduced in the volume.

Shamos Morris H. and George M. Murphy editors

Recent advances in science, physics and applied mathematics. New York New York University Press, 1956 distributed by Inter science Publishers, New York. 384 p illus. 24 cm. $7.50. 38

Contents: Methods of applied mathematics, by R. Courant. The future of operations research, by P. M. Morse. Atomic structure, by I. I. Rabi. Microwave spectroscopy, by C. H. Townes. Nuclear structure and transmutations, by H. A. Bethe. Elementary particles, by V. F. Weisskopf. Electronuclear machines, by L. J. Haworth. Neutron physics, by N. F. Ramsey. Transistor physics, by W. Shockley. Ferromagnetism, by R. M. Bozorth. Cryogenics—very-low temperature physics and engineering, by F. G. Brickwedde. Physics and the engineer, by E. U. Condon. Index.

Note: Collected in this volume is a group of lectures delivered at the first Symposium on Recent Advances in Science, sponsored by New York University in 1954. The symposium was planned to convey the latest ideas in some of the newest and most active fields of study. As the names in the above contents show some of the most eminent scientists currently working in the U.S.A. wrote the lectures. They addressed audiences possessing scientific backgrounds but working in other fields. The book therefore amounts to a collection of papers by experts endeavoring to explain advances in their own fields to persons outside those fields but able to understand the terminology of physics and the concept of mathematical equations.

Shapley, Harlow and others, editors

A treasury of science. Edited by Harlow Shapley Samuel Rapport and Helen Wright. Third revised edition, with new material on electronics nuclear physics and contemporary medicine, and a new section on science and the future. New York Harper & Brothers 1954 724 p. 22 cm. $5 95 39

Contents (abridged) Part I, Introduction. Part II, Science and the scientist. Part III, The physical world: The heavens. The earth. Matter, energy, physical law. Part IV, The world of life: The riddle of life. The spectacle of life. The evolution of life. Part V, The world of man: From ape to civilization. The human machine. The conquest of disease. Man's mind. Part VI, Science and the future.

Note: An anthology of writings selected for general readers rather than for specialists or matriculated students. It contains biographical sketches of great scientists, classics of scientific writings, and recent essays and excerpts that illustrate the status and contributions of modern science. The present edition contains about 75 selections which are organized under the headings listed above. The names of authors are given. In comparison to the preceding edition, published in 1946, the material that appeared in the subsection, "Atomic fission," has been incorporated in other sections, and its place has been taken by a new section bearing the title, "Science and the future," and containing six selections, only two of which are devoted to nuclear energy.

Smithsonian Institution

Annual report of the Board of Regents of the Smithsonian Institution showing the operations, expenditures, and condition of the Institution for the Year Ended June 30 1955 Washington, D C. Government Printing Office 1956 537 p. illus. 23 cm $4 00 40

Contents (abridged) Summary of the yearly activities of the Institution. Reports of branches of the Institution: United States National Museum, Bureau of American Ethnology, Astrophysical Observatory, National Collection of Fine Arts, Freer Gallery of Art, National Air Museum, National Zoological Park, Canal Zone Biological Area, International Exchange Service, National Gallery of Art. Report on the library. Report on publications. Report of the Executive Committee of the Board of Regents. General appendix: Science serving the Nation, by L. A. DuBridge. The development of nuclear power for peaceful purposes, by H. D. Smyth. The time scale of our universe, by E. J. Öpik. Solar activity and its terrestrial effects, by H. S. Jones. Forty years of aeronautical research, by J. C. Hunsaker. A transatlantic telephone cable, by H. A. Affel. Genetics in the service of man, by B. Glass. Cultural status of the South African man-apes, by R. A. Dart. The history of the mechanical heart, by G. B. Griffenhagen and C. H. Hughes. Some chemical studies on viruses, by W. M. Stanley. The scent language of honey bees, by R. Ribbands. The army ants, by T. C. Schneirla. The hibernation of mammals, by L. H. Matthews. Parasites common to animals and man, by B. Schwartz. Some observations on the functional organization of the human brain, by W. Penfield. The place of tropical soils in feeding the world, by R. L. Pendleton. Tree rings and history in the western United States, by E. Schulman. New light on the dodo and its illustrators, by H. Friedmann. George Catlin, painter of Indians and the West, by J. C. Ewers.

Note: This annual publication is organized in two parts. The first and shorter part is essentially a business report of the Smithsonian Institution and of its branches for the year. The second part contains scientific papers, some of which are reprints and some of which are published for the first time. In the issue listed here, the second part runs to 344 pages and contains the papers whose authors and titles are given above. Other recent volumes in the series have been organized similarly.

Special Libraries Association Science Technology Division

Handbook of scientific and technical awards in the United States and Canada, 1900–1952 Edited by Margaret A. Firth. New York Special Libraries Association, 1956 491 p. 22 cm. $10.00 41

Content List of periodicals and abbreviations. Associations. American awards. Canadian awards. Index of recipients and award titles. Subject index.

Note A gap in science and technology reference books has been filled by the publication of this volume. It covers awards made in various fields of *science and technology* by scientific and technical associations in the United States of America and Canada. The arrangement is by name of association then name of award. The record of individual awards is arranged chronologically Each award is concisely described, and the names of the recipients are given. An additional helpful *feature is the inclusion of literature* references for individual presentations made since 1929

SPOEHR, HERMAN AUGUSTUS

Essays on science, a selection from his works With a foreword by C Stacy French, contributions by Alexander Spoehr, Hortense Spoehr Miller, and James H. C Smith, and a bibliography compiled by Wilbur A Pestell. Stanford Stanford University Press, 1956 220 p illus. 23 cm. $5 00 42

Contents Herman Augustus Spoehr A personal appreciation, by A. Spoehr and H.-S. Miller Herman Augustus Spoehr His scientific background and philosophy by J H. C. Smith. Essays on science, by H. A. Spoehr Science and society The growth of science. Science, plants, and man. Scientific *researches of Herman Augustus* Spoehr by J H. C. Smith. Bibliography of Herman Augustus Spoehr by W A. Pestell. Acknowledgments. Index.

Note Dr Spoehr at one time head of the Department of Plant Biology of the Carnegie Institution, and Director of Natural Sciences of the Rockefeller Foundation, is best known for his work in the fields of plant physiology and botany His wider scientific interests, particularly as regards the social significance of science are reflected in this selection *of his* writings on the philosophy of science. Each of the six papers appeared originally as periodical article or was given as a lecture or address. The book includes brief biographical sketch of Spoehr résumé of his scientific researches, and bibliography of his works.

UNITED STATES NATIONAL SCIENCE FOUNDATION

Organization of the Federal Government for scientific activities. Federal agencies and their organizational units engaged in conduct of research and development, planning and administration of research and development, expansion of research and development plant facilities, testing, evaluation and standardization training of scientific manpower, dissemination of scientific information collection of general purpose statistics in the natural and social sciences. Washington, D C Government Printing Office, 1956 349 p illus. 26 cm (National science studies NSF 56-17) $1 75 43

Contents Introduction. Part I, Development of the Federal organization for scientific activities Evolution and characteristics of the Federal organization for science to *1947* Major developments in the Federal organization for scientific activities since 1947 Part II, Directory of Federal organization for scientific activities. Prefatory notes. Department of Agriculture. Atomic Energy Commission. Civil Aeronautics Board. United States Civil Service Commission. Department of Commerce. Department of Defense. Executive Office of the President. Farm Credit Administration. Federal Civil Defense Administration. Federal Communications Commission. Federal Power Commission. Federal Reserve Board. Federal Trade Commission. General Services Administration. Department of Health, Education and Welfare. United States Information Agency Department of Interior Interstate Commerce Commission. Department of Justice Department of Labor National Advisory Committee for Aeronautics. National Science Foundation. Post Office Department. Railroad Retirement Board. Securities and Exchange Commission. Smithsonian Institution. Department of State. United States Tariff Commission. Tennessee Valley Authority Department of the Treasury Veterans Administration. Advisory Committee on Weather Control. Interdepartmental Committee on Scientific Research and Development. National Academy of Sciences—National Research Council. Appendices Glossary List of professional specialties used by Federal agencies for reporting employment of scientific professional personnel. Advisory and coordinating mechanisms for scientific activities. Index.

Note The scope of this *publication* is indicated in its title and subtitle. Its contents derive from study of Federal organizations made by the National Science Foundation during 1954 and *1955* It covers organization for basic, applied, and developmental research and for scientific data collection in the physical, biological, and social sciences. The major portion of the publication is devoted to the organization for scientific activities of each department and agency of the Federal Government for each are described general functions, scientific activities, funds and personnel, accompanied by full-page organization chart of the department, commission, or division described. One hundred thirty-one major and minor government organizations are thus pictured.

VISHER, STEPHEN SARGENT

Scientists starred 1903–1943, in "American men of science a study of collegiate and doctoral training birthplace, distribution, backgrounds, and developmental influences. Baltimore The Johns Hopkins Press 1947 556 p illus. 23 cm $4 50 44

Content Introduction. Summary chiefly graphical. Lists of the starred scientists. Collegiate training of the starred scientists. Doctoral training of starred scientists. Other academic training and extent of schooling. Age of scientists when starred. Birthplaces of starred scientists. Distribution of starred scientists by place of work. Some backgrounds and judgments deduced from questionnaire returns. Summary and conclusions. Index.

Note An analysis of data concerning some 1,600 men and women distinguished for notable research in certain fundamental sciences. The study covers 40-year period dating from 1903 when Professor Cattell in his *American men of science* introduced the practice of starring leading research workers in 12 sciences he had arbitrarily chosen. The scientists whose achievements have won this special recognition have been selected impartially by their professional colleagues. The author's long-standing interest in starred scientists has resulted in his writing numerous magazine articles from some of which he has incorporated material in the present study Here he has tabulated and analyzed major factors in the scientists' careers to discover what conditions correlate with their productivity His purpose has been to ascertain, if possible, methods by which young scientists can most adequately be helped to high achievement.

WILSON, EDGAR BRIGHT, JR.

An introduction to scientific research New York McGraw Hill Book Company Inc. 1952 375 p illus 24 cm. $6 00 45

Contents The choice and statement of research problem Searching the literature. Elementary scientific method. The design of experiments. The design of apparatus. The execution of experiments. Classification, sampling, and measurement. The analysis of experimental data. Errors of measurement. Probability randomness, and logic Mathematical work. Numerical computations. Reporting the results of research. Conclusion. Index.

Note The basic knowledge of research methods which research scientist must possess in order to use his time and experimental material efficiently is outlined in this book. Some of the chapters are very brief for example, that on searching the literature is only 11 pages long Some chapters are considerably longer the one on the design of apparatus being nearly 60 pages long. Even so, the reader is told how to go about designing apparatus rather than how to design it. All of the chapters are equipped with excellent selected bibliographies. The book is well organized and is written in style which is easy to read. Beginning research scientists will find it invaluable and experienced ones may profit from reading at least some sections.

HISTORY

BELL WHITFIELD, JR.

Early American science needs and opportunities for study Williamsburg Va. Institute of Early American History and Culture

distributed by the University of North Carolina Press 1955 85 p. 24 cm. $1.50 46

Contents: Early American science—a survey. Bibliography: General history of science. History of science in America. Periodicals. Fifty early American scientists—selected bibliographies. Index.

Note: This book is one of a series of volumes sponsored by the Institute of Early American History and Culture. Now that in the broadening of historical studies, into fields where little research has been done and where new approaches to old problems challenge investigators. It consists of two parts: a 34-page survey of the status of the history of early American science with special emphasis on research needed, and a four-part bibliography of published monographs, periodicals, and source materials on 50 early American scientists. The last-mentioned part accounts for 38 pages of the bibliographical section. It would be a logical starting point for anyone who is planning to undertake research on an early scientist of the American colonies and the United States of America.

BOYNTON HOLMES editor

The beginnings of modern science scientific writings of the 16th, 17th and 18th centuries New York Published for the Classics Club by Walter J Black, 1948. 634 p. illus. 19 cm. $3 12 47

Contents (abridged): Foreword, by H. B. Lemon. Matter and motion. Light, heat and fire. The study of air and of chemistry. Electricity. The earth and its waters. How plants grow. The structure of the human body. The science of healing. Scientists think about science. Index.

Note: A well-chosen anthology of significant writings in the development of the sciences. Within each of the sections the chosen selections are arranged chronologically. Most of the selections are short and in language that the interested layman can readily understand. Concise accounts of the influence of each author upon science are included.

CLAGETT MARSHALL

Greek science in antiquity New York Abelard-Schuman, Inc 1955 217 p. illus. 24 cm. $4 5 48

Contents: Part I. The origins of science in antiquity. Science in Egypt and Mesopotamia. Greek science. Origins and methods. Science and early natural philosophy. Greek medicine and biology—mathematics—physics—astronomy. Roman science. Part II. Science in late antiquity. Science and spiritual forces in late antiquity. Science and patristic literature. Latin science in late antiquity—in the early Middle Ages. Greek science in the age of Justinian. In the end the beginning. Appendices. Further readings. Index.

Note: This volume describes the development of scientific thought from its earliest manifestations in prehistoric times until about the period 600 A.D. As might be expected, the discussion of the prehistoric period constitutes only a small portion of the book. The majority of the chapters deal with the manner in which scientific principles and theories gradually evolved after the advent of written records. The book is thus more than a simple descriptive outline of the scientific achievements of the ancient Greeks. Written primarily for students and the interested layman lacking a scientific background, it will also be of value to the science historian. A bibliography of suggested readings is included.

COHEN I BERNARD

Franklin and Newton an inquiry into speculative Newtonian experimental science and Franklin's work in electricity as an example thereof. Philadelphia The American Philosophical Society 1956. 657 p. 23 cm. (American Philosophical Society Memoirs. Vol. 43) $6.00 49

Contents: Part I. Introduction—Franklin and Newton. The study of eighteenth-century Newtonian science. Franklin's scientific reputation. The scientific personality of Franklin and of Newton. Part II. Newton—the new natural philosophy. Physical theory in the age of Newton and Franklin. The two major sources of the Newtonian philosophy—the *Principia* and the *Opticks*. Experimental Newtonianism and the role of hypotheses—the exact corpuscular philosophy of the *Opticks*. Part III. Newton and Franklin—the new corpuscular philosophy. Experimental Newtonianism in eighteenth-century science. Franklin's introduction to science. Benjamin Franklin's contributions to the Newtonian natural philosophy. Part IV. Franklin—the rise of electricity as a Newtonian science. Electricity—the new natural philosophy of the eighteenth century. The Franklinian theory of electricity. The reception of the Franklin theory—atmospheric electricity and lightning rods. Further applications and development of the Franklin theory—the [illegible] need for the concept of some [illegible]. Appendices: Newton's use of the word *hypothesis*. "Mathematical principles" and "Natural philosophy." Originality in scientific discovery with special reference to Franklin's experiments and his concept of the electric field. Bibliography. Index.

Note: A major contribution to the history of experimental science. The author, an eminent authority on the history of science and editor of the journal, *Isis*, took as his aim the examination of [illegible] the nature of scientific thought by considering the interaction between the creative scientist and his scientific environment. He throws new light on the influence of Newton and particularly shows that the *Opticks* stimulated the development of speculative and experimental interest in science of which Franklin's scientific work was a product. The treatment is scholarly with careful citation of sources. The bibliography runs to almost 35 pages. One of the appendices is devoted to [illegible] *Lagrange* of the general problem of evaluating the degree of originality in scientific work.

COHEN I BERNARD

Some early tools of American science an account of the early scientific instruments and mineralogical and biological collections in Harvard University. With a foreword by Samuel Eliot Morison. Cambridge Mass. Harvard University Press 1950 201 p. illus. 25 cm. $4 5 50

Contents: Introduction. The history of science at Harvard. Note on the currency of Harvard College. Scientific instruments at Harvard before the fire of 1764. Instruments for the study of natural philosophy after the fire of 1764. The beginnings of chemistry at Harvard. The biological sciences, the Museum, and the Mineral cabinet. Conclusion. Appendices: Thomas Hollis' gift of philosophical apparatus. The philosophical apparatus in 1779. Some early instruments and specimens at Harvard University. The chemical laboratory in 1821. Bibliographical note. References and notes. Index.

Note: Harvard University maintains a notable collection of old scientific instruments, dating from about 1764. This volume is essentially an illustrated catalogue of these instruments as they, with some mineralogical and biological specimens, were exhibited in February 1949. It is more valuable, however, as a contribution to the history of science and science teaching in America. The actual description of the various pieces of apparatus is preceded by a discussion of how such instruments were obtained and the manner of their use in teaching and research during the colonial period.

CONANT JAMES BRYANT

On understanding science an historical approach. New Haven, Conn. Yale University Press, 1947 145 p. illus. 21 cm. (The Terry lectures) $2 00 51

Contents: The scientific education of the layman. Illustrations from the 17th century "Touching the spring of the air." Examples from the 18th century concerning electricity and combustion. Certain principles of the tactics and strategy of science. Notes and bibliographies. Index.

Note: The slow rate at which the methods and discoveries of modern science are assimilated into the cultural pattern of the nonscientist is a matter of deep concern to students of present-day society. In this book, the former President of Harvard College discusses a proposed college course that would be planned for students who will enter such professions as law, teaching, politics, writing and business, the purpose of the course being to give such students an understanding of the scientific method. Thus the work is addressed primarily to educators, but there is much in it for any reader interested in the social implications of science. The text was first delivered as lectures at Yale University on the Dwight Harrington Terry Foundation.

DE SANTILLANA, GIORGIO

The crime of Galileo Chicago University of Chicago Press, 1955 339 p illus. 23 cm. $5 75 52

Note A detailed and penetrating study of the first major conflict between social authority and modern science, based on fresh examination of the documentary sources. The author's primary thesis is that both Galileo and the Church were the victims of others who saw in Galileo's views on the Copernican universe a threat to basic theological philosophy He states "It has become a set piece in history to present Pope Urban VIII and his counselors as the bigoted oppressors of science. It would be possibly more accurate to say that they were the first bewildered victims of the scientific age. They had come into collision with forces of which they had not the faintest notion. The trial and the machinations that preceded it and revolved around it are the primary subjects. The author in his preface points out parallels in our times, but these are not carried over into the body of the book.

GUERLAC, HENRY

Science in western civilization a syllabus. New York The Ronald Press Company 1952 197 p 24 cm $3 00 53

Note This exemplary work contains an outline of the development of science in western civilization, set up under the head of 91 lectures. The lectures bear such titles as "The Mesopotamian civilization, Greek medical science, Alchemy and Arabic chemistry "The evolution of the calculus," "Development of the atomic theory and "Science in the United States. For each lecture, there are an outline of topics and list of suggestions for reading. A classified list of general references is placed at the end of the volume.

HARVARD CASE HISTORIES IN EXPERIMENTAL SCIENCE

Robert Boyle's experiments in pneumatics. Edited by James B Conant. Cambridge, Mass Harvard University Press, 1950 70 p illus. 23 cm (Case 1) $1 10 54

Content (abridged) The air pump or vacuum pump as new scientific instrument. The behavior of a Torricellian barometer in a vacuum Boyle's experiments on air as a medium for transmitting sound. The discovery of Boyle law Notes on the development of science in the middle of the seventeenth century

—— The overthrow of the phlogiston theory the chemical revolution of 1775–1789 Edited by James B Conant. Cambridge Mass. Harvard University Press 1950 59 p illus 23 cm. (Case 2) $1 00 55

Contents (abridged) The opening phase of the chemical revolution. English translation of the two versions of the Easter memoir of Lavoisier Priestley's comment on Lavoisier' Easter memoir The steps leading to Priestley's discovery of oxygen. The final collapse of the phlogiston theory

—— The early *development of the concept* of temperature and heat the rise and decline of the caloric theory Prepared by Duane Roller Cambridge Mass Harvard University Press 1950 106 p illus 23 cm (Case 3) $1 50 56

Contents (abridged) Evolution of the thermometer Joseph Black's discoveries of specific and latent heats. Count Rumford's investigation of the weight ascribed to heat Count Rumford's experiments on the sources of heat that is excited by friction. Humphrey Davy's early work on the production of heat by friction.

—— The atomic molecular theory By Leonard K. Nash. Cambridge, Mass. Harvard University Press, 1950 115 p 23 cm. (Case 4) $1.50 57

Contents (abridged) The application of the atomic theory to chemistry Gay-Lussac's law of combining volumes. The apparent inconsistency of the atomic theory and the law of combining volumes. Avogadro's reconciliation. Sources and references.

—— Plants and the atmosphere. By Leonard K. Nash. Cambridge, Mass. Harvard University Press, 1952 122 p. illus. 23 cm. (Case 5) $1 50 58

Contents (abridged) A problem emerges. The problem is brought to a sharp focus by discrediting the facile explanation. Priestley picks up the trail. Ingen-Housz assumes the lead. The evolution of Senebier's theoretical views, 1782 1792. The development of Ingen-Housz' ideas, 1779–1796. De Saussure revises the data and reconstructs the theories. Bibliography

—— Pasteur's study of fermentation. Edited by James Bryant Conant. Cambridge, Mass. Harvard University Press, 1952 57 p illus 23 cm (Case 6) $1 00 59

Content (abridged) Some elementary principles of biochemistry Pasteur's early work on optical activity which resulted in his study of fermentation. Translation of portions of Pasteur's memoir on lactic formation. Theories of fermentation from Liebig to the present day Tyndall's lecture on fermentation.

—— Pasteur's and Tyndall s study of *spontaneous* generation. Edited by James Bryant Conant. Cambridge, Mass. Harvard University Press, 1953 *61 p* illus. 23 cm (Case 7) $1 25 60

Contents: Translation of a portion of Pasteur's "Memoir on the organized corpuscles which exist in the atmosphere. Translation of excerpts from Redi's "Experiments on the generation of insects. Certain of Pasteur' experimental results as reported in Chapter IV of his "Memoir" of 1862 Translation of further portion of Pasteur's "Memoir" of 1861 Tyndall's article on spontaneous generation. Suggested reading.

—— The development of the concept of electric charge Electricity from the Greeks to Coulomb By Duane Roller and Duane H D Roller Cambridge Mass Harvard University Press, 1954 97 p illus 23 cm (Case 8) $1 60 61

Contents Electricity to 1600—the work of William Gilbert. The 17th century Francis Hauksbee's experiments Stephen Gray's experiments on conduction and electrification by influence. Dufay's experiments and discoveries. Some striking results of the popularization of science in the 18th century Benjamin Franklin's experiments, theories, and inventions. The introduction of quantitative methods into electrical science. Bibliography

Note. This series represents planned effort to make available materials from the history of modern science that illustrate the methods of science. The series is addressed particularly to undergraduate college students who are pursuing courses in the humanities and the social sciences, and its primary purpose is to give such students a "feeling" for science that will facilitate the appreciation of science and technology as segment of the social activity of civilized man. The series is also suitable for reading by laymen with mature interests in the methods and history of science. Each of the booklets in the series contains an analysis of major scientific development. Extensive use is made of excerpts from the scientists' own accounts of their experiments and hypotheses, but there is also much text written by the editor or author of each booklet. The series is not mere collection of excerpts or "readings. Some of the booklets contain lists of suggested readings; others, bibliographies of sources.

HINDLE, BROOKE

The pursuit of science in Revolutionary America, 1735–1789 Published for the Institute of Early American History and Culture Williamsburg Virginia. Chapel Hill University of North Carolina Press 1956 410 p. illus. 24 cm. $7.50. 62

Contents: Introduction. Part I, Colonial circles and ties, 1735–1765: The natural history circle. The doctors—naturalists and physicians. Scattered dreams and unexpected accomplishment. Teachers and preachers. Part II, Along the road to revolution, 1765–1775: Agitation and organization. The American Philosophical Society. The transit of Venus. The sciences. American improvement. Part III, The new nation, 1775–1789: The war. The prophets of glory and their temples of science. Medicine in the Republic. Natural history in the Republic. Natural philosophy in the Republic. Theory and practice. The American Revolution and the pursuit of science. Bibliographical note. Index.

Note: A study of the direct connection between social maturity and the capacity to advance science. The author shows how naturalists, physicians, and college teachers were the early recorders of scientific knowledge in colonial America, in lieu of the great libraries and other resources of Europe. He traces the evolution and the gradual maturing of the scientific interest in the colonies and early republic, and critically evaluates the stature and contributions of the leaders. The vital role of the American Philosophical Society is described. The treatment is a scholarly one, based on a lengthy examination of the source material. Sources of specific information are cited in the form of footnotes throughout the book. The [illegible]-page "bibliographical note" at the end of the volume is a narrative account of the principal published and manuscript sources available to scholars who are interested in the history of science in early America.

HORNBERGER, THEODORE

Scientific thought in the American colleges 1638–1800 Austin Texas The University of Texas Press, 1946 108 p. illus. 24 cm. (University Research Institute. Project no. 67) $1.50. 63

Contents: Values in the history of science. The first American colleges. Entrance requirements. The curriculum. Teachers, methods, and textbooks. Libraries. The effects. Notes. Index.

Note: A carefully documented study of the attitude of early American colleges toward science and scientific thought as based on a study of the extant records of eight colleges which were functioning before 1780. The colleges discussed are Harvard, Yale, Brown, Dartmouth, Columbia, Princeton, Pennsylvania, and William and Mary. The final chapter considers the opposition to science as it was voiced by [illegible] men of the period.

MCKEEHAN, LOUIS WILLIAMS

Yale science the first hundred years 1701–1801 Issued in connection with the centennial anniversary of the Sheffield Scientific School, Yale University 1847–1947 New York Henry Schuman, 1947 82 p. 19 cm. (Yale University School of Medicine. Historical Library Publication no. 18) $2.50 64

Contents. Preface, by Theodore Hornberger. [illegible], 1701–1778. [illegible], 1739–1799. [illegible], 1773–1801. Conclusion. Notes. Index.

Note: A brief, but carefully documented review of the rather halting scientific interests and activities at Yale College (now Yale University) during its first century. It serves well as background to J. F. Fulton and E. H. Thomson's *Benjamin Silliman, 1779–1864*, New York, 1947.

MEES, CHARLES EDWARD KENNETH

The path of science with the cooperation of John R. Baker New York, John Wiley & Sons Inc., 1946 250 p. illus. 22 cm. $3.90. 65

Contents: The interpretation of history. The birth of history. The method of science. The development of the scientific method. The growth of physical ideas. The growth of chemical ideas. The growth of biological ideas, by Dr. John R. Baker. The production of scientific knowledge. Applied science and industrial research. The path of science. Index.

Note: A thought-provoking outline of the beginnings and development of scientific knowledge and of its effects upon society. The main emphasis is upon biological, chemical, and physical knowledge, and no attempt is made to give accounts of all the sciences. The rate of scientific discoveries is compared to an autocatalytic reaction that proceeds faster and faster as more knowledge is accumulated. The author's position as Vice President in Charge of Research of the Eastman Kodak Company lends special interest to his views on the organization and importance of industrial research. Most of the book was delivered as lectures at the University of California in 1945.

MOULTON, FOREST RAY, AND JUSTUS J SCHIFFERES editors

The autobiography of science. Garden City Doubleday & Company Inc., 1950 666 p. 22 cm. $4.50. 66

Contents (abridged): Science is born—in antiquity. Science sleeps—in the Middle Ages. Science reawakens—in the Renaissance. Science grows up—in the seventeenth and early eighteenth centuries. Science comes of age—during the French, American, and industrial revolutions. Science seeks progress—in the early nineteenth century. Science [illegible]—in the age of evolution. Science [illegible] the twentieth century. Selected readings in the history of science. Acknowledgments. Index by topics and names.

Note: An anthology of writings in which the world's [illegible] scientists described or discussed their most important discoveries. All of the selections are in the English language; in other words, translations into English have been used, rather than original texts in other languages. The range in time is from the 4,000-year-old Edwin Smith Surgical Papyrus to *An almanac for moderns*, by Donald Culross Peattie, published in 1935. The editors have been exceptionally successful in finding passages that describe landmarks in the development of science and at the same time are suitable for reading by nonspecialists. The average length of a selection is under six pages, but some passages are considerably longer. The passages from an individual scientist's writing are preceded by a short essay on his life and work, written by the editors. The book can be read consecutively as a panorama of the development of science, or it can be used as a reference book of landmark documents in the literature of Western science.

OEHSER, PAUL HENRY

Sons of science the story of the Smithsonian Institution and its leaders. New York Abelard Schuman, Ltd., 1949 220 p. illus 22 cm. $4.00. 67

Contents: James Smithson and his will. Interlude: What to do with half a million dollars. Joseph Henry builds an institution. Baird and the National Museum. George Brown Goode, the young zealot. Samuel Pierpont Langley: A scientist takes the helm. Rounding out a century. Chronology of principal events in Smithsonian history. Selected bibliography. Index.

Note: By organizing his material around the lives and accomplishments of six men, Joseph Henry, Spencer Fullerton Baird, George Brown Goode, Samuel Pierpont Langley, Charles Walcott, and Charles Greeley Abbot, of whom all but Goode were secretaries of the Smithsonian Institution, the author of this book has produced a very readable outline of the history and development of the Smithsonian Institution from its beginning down to the year 1949. The biographical accounts include personal data, such as dates of birth and schools attended, but are largely devoted to activities in the Smithsonian Institution and its affiliated organizations. The textual material is supplemented by 39 well-chosen illustrations, a chronology of outstanding events in the history of the Smithsonian, and a selected bibliography.

PENNSYLVANIA UNIVERSITY BICENTENNIAL CONFERENCE

Studies in the history of science, by E. A. Speiser and others. Philadelphia University of Pennsylvania Press 1941 123 p. illus. 23 cm. $1.50. 68

Contents. Ancient Mesopotamia and the beginnings of science by E. A. Speiser Some fundamental concepts in ancient astronomy by O E. Neugebauer Medicine and surgery in ancient Egypt, by H. Ranke. Medieval medicine, by H. E. Sigerist. The rise of modern scientific medicine by R. H. Shryock. Two centuries of surgery by E. A. Graham. Logico-historical study f mechanism, vitalism, naturalism, by E. A. Singer The mathematical way of thinking, by H Weyl.

Note Although the subjects of these papers are scientific, the style is generally nontechnical and understandable to the lay man. "Two centuries of surgery" includes brief list of refer ences. In some of the other papers, footnotes refer to other liter ature on the subject.

PERSONS, STOW, editor

Evolutionary thought in America. New York George Braziller, 1956 462 p illus. 24 cm $5 00 69

Content Part I The theory of evolution The rise and impact of evolutionary ideas, by R. Scoon. Evolution in its relation to the philosophy f nature and the philosophy f culture by F S C. Northrop The genetic nature f differences among men by T Dobzhansky Part II, Evolutionary thought in America. Evolution and American sociology by R. E. L. Faris. The impact of the idea of evolution on the American political and constitutional tradition, by E. S Corwin Evolutionism in American economics, 1800–1946 by J J Spengler The influence of evolutionary theory upon American psychological thought, by E. G Boring. N turalism in American literature by M. Cowley The idea f organic expression and American architecture by D D Egbert. Evolution and moral theory in America, by W F Quillian, Jr. Evolution and theology in America, by S. Persons. Index.

Note. A collection of original papers which were prepared for delivery at Princeton University during the academic year 1945–46 as part of its special program in American civilization. Although the treatment is on an upperclass undergraduate level the book as a whole presents an authoritative and well-rounded picture of its subject and, therefore, it merits reading by persons outside of colleges who are interested in the impact f science on social thought or upon the history f organic evolution. Bibliographical citations and scholarly notes accompany most of the chapters. This edition is a re-issue of the original edition published by Yale University Press in 1950.

SARTON, GEORGE

Ancient science and modern civilization. Lincoln The University of Nebraska Press 1954 111 p 22 cm. $2 50 70

Content Preface, Euclid and his time. Ptolemy and his time. The end of Greek science and culture.

Note Three lectures delivered t the University of Nebraska in April, 1954 on the Montgomery Lectureship on Contemporary Civilization are published in this volume. The contribution of ancient science to modern civilization is the unifying theme of the lectures. However it is not over-emphasized and, quite aside from it, the lectures can be read profitably for the author's penetrating comments on the world of Hellenism.

SARTON, GEORGE

The appreciation of ancient and *medieval* science during the Renaissance (1450–1600) Philadelphia University of Pennsylvania Press 1955 233 p illus 23 cm (The A. S W Rosenbach Fellowship in Bibliography) $5 00 71

Content Introduction. Lecture I, Medicine. Lecture II Natural history Lecture III, Mathematics and astronomy Epilogue. Appendix The survival f ancient and medieval men f science in fourteenth and fifteenth centuries. Notes. General bibliography key to abbreviations. Index.

Note Four lectures, three of which were delivered on a Rosenbach Fellowship at the University of Pennsylvania in 1955 are published in this volume. Using printed books as the primary indicator f Renaissance awareness and knowledge f ancient and medieval science the author discusses the scientific books published in the second half of the fifteenth and the whole of the sixteenth century He lists titles and dates of ... the nature f the books themselves, and makes comments on the importance and influence f the authors. The texts of the lectures are supplemented by 40 pages of notes which contain much material of interest to students of the history of science.

SARTON, GEORGE

A guide to the history of science. A first guide for the study of the history of science with introductory essays on science and tradition. Waltham, Mass Chronica Botanica Company, 1952 316 p illus 23 cm. $7.50 72

Contents (abridged) Part I, Introductory essays Science and tradition. Part II A first guide for the study of the history of science. A. History Historical methods. Historical tables and summaries. Historical tlases. Gazetteers. Encyclopedias. Biographical collections. B Science Scientific methods and philosophy f science. Science and society Catalogues of scientific literature. Union lists of scientific periodicals. General scientific journals. Abstracting and review journals by C. F Mayer National academies and national scientific societies. C, History of science Chief reference books on the history of science. Treatises and handbooks on the history of science Scientific instruments. History f science in special countries. History f science in special cultural groups. History of special sciences. Journals and serials concerning the history and voted t the history of science. International organization of the study and teaching f the history of science National societies devoted to the history of science. International organization of the history of science The teaching of the history f science. Institutes, museums, libraries. I ternational congresses. Prizes. Index of proper names.

Note The first part of this book which contains lectures titled as indicated in the table f contents, occupies only 64 pages. The rest of the space is devoted to bibliographies f histories of science and related publications and to descriptions of societies, institutes, museums and libraries with special interests or collections of materials bearing on the history of science. Although the bibliographical and directory parts are valuable for reference, the special emphasis on the history f science has resulted in a certain weakness that is most apparent in the list of institutes, museums, and libraries Here a number of small institutions are fully described, but larger institutions which possess much more material that is valuable to historians f science are not listed because they do not emphasize the field above other fields of knowledge. The index covers personal names adequately but does not include the names of the congresses, societies, museums, etc., that are described in the book.

SARTON, GEORGE

A history of science ancient science through the golden age of Greece. Cambridge Mass Harvard University Press, 1952 646 p illus 25 cm. $10 00 73

Contents Part I, Oriental and Greek origins The dawn f science Egypt. Mesopotamia. Dark interlude. The dawn of Greek culture—Homer and Hesiod. Assyrian intermezzo. Ionian science in the sixth century Pythagoras. Part II The fifth century: Greece against Persia—the glory f Athens. Philosophy and science to the death f Socrates. Mathematics, astronomy and technology in the fifth century Geographers and historians of the fifth century Greek medicine of the fifth century chiefly Hippocratic. The Hippocratic corpus. Coan archaeology *Part III The fourth century:* Plato and the Academy Mathematics and astronomy in Plato's time. Xenophon. Aristotle and Alexander—the Lyceum. Mathematics, astronomy and physics in Aristotle's time. The natural sciences and medicine in Aristotle's time. Aristotelian humanities and historiography in the second half f the fourth century B. C. Other theories and end of knowledge—the garden and the porch. Epilogue The cycle. General bibliography Index.

In contrast to the author's well-known *Introduction to the history of science*, this work is designed for reading rather than for reference. Its scope is almost as broad as that of the *Introduction*, and the style is as erudite. The content of Greek science is examined in minute detail, and the author points out numerous unexpected relationships. The subject content of the work is such that it is of interest not only t students f the history f science but also to students of archaeology and anthropology Almost every page contains one or more footnotes which amplify or document points in the text. The general bibliography noted in the table is, however only short list of principal authorities.

SARTON GEORGE

The History of science and the New Humanism. Third edition. New York George Braziller Inc., 1956 196 p. 21 cm. (Colver Lectures in Brown University Elihu Root Lecture at the Carnegie Institution of Washington) $3.00. 74

Contents: Preface The faith of a humanist. The history of science and the history of civilization. East and West. The New Humanism. The history of science and the problems of today Index.

Note: Except for the Preface to the third edition, the text of the book is the same as that of the edition published at Cambridge, Massachusetts, in 1937 and described under No. 1 [illegible] 1932-44 volume. The first essay "The Faith of a humanist," was first published in Volume 3 of *Isis*. The other four [illegible] as lectures. The author's main theme is that it is not sufficient to popularize scientific education. It is necessary to educate the scientists themselves so that they know not only the [illegible] of today but also the beginnings and evolution of their knowledge.

SARTON GEORGE

Introduction to the history of science. Baltimore Published for the Carnegie Institution of Washington by the Williams & Wilkins Company 1931–48 3 v in 5 26 cm (Carnegie Institution of Washington. Publication no. 376) Vol. I, $10 00 vol. II (in two parts) $15.00 vol. III (in two parts) $20.00 75

Contents (abridged): Volume I From Homer to Omar Khayyam. Volume II From Rabbi Ben Ezra to Roger Bacon Volume III Science and learning in the fourteenth century

Note: A monumental reference work which gives for each epoch [illegible] condensed survey of the developments in the various branches of learning, brief biographical and critical sketches of the most important figures, references to the principal texts of their works and to the principal critical studies. The author has defined science as systematized positive knowledge and has included prophets, philosophers and others not usually included in [illegible] history of science.

SARTON GEORGE

The life of science essays in the history of civilization. Foreword by Max H Fisch. New York Abelard-Schuman Inc. 1948 197 p. 22 cm. $3.00. 76

Contents (abridged): Foreword, by M H Fisch Part [illegible] The [illegible] of understanding. The history of medicine versus the history of art. The history of science Part [illegible] Secret history Leonardo and the birth of modern science Evariste Galois. Ernest Renan. Herbert Spencer Part III East and West in the history of science Part IV Casting bread upon the face of the waters An institute for the history of science and civilization Casting bread upon the face of the waters. Editorial note acknowledgments, and [illegible]. Index.

Note: During his lifetime the author of this book gained an international reputation as an authority on the history of science. This collection of essays has been selected and adapted from his writings, which appeared in scholarly and scientific journals over a period of 30 years. They are written for the general reader and have one common purpose—to provide him with an understanding of the scope, purpose, and methods of the study of the history of science.

SEDGWICK WILLIAM THOMPSON AND H. W TYLER

A short history of science. Revised by H. W Tyler and R. P Bigelow Second edition. New York The Macmillan Company 1939 512 p. illus. 22 cm. $6 75 77

Contents: The dawn of civilization. Science begins in the East. The earliest Greek science. Science in the golden age of Greece Greek science in Alexandria. The decline of Alexandrian science. The Roman world—the dark ages. Hindu and Arabian science—the Moors in Spain. Progress of science to A.D. 1 [illegible]. A new astronomy and the beginnings of modern natural science. Mathematics and mechanics in the sixteenth and early seventeenth centuries. Natural and physical science in the seventeenth century. Beginnings of modern mathematical science. Natural and physical science in the eighteenth century Modern tendencies in mathematical science Some advances in the physical and chemical sciences during the nineteenth century Some advances of natural science in the nineteenth century Some [illegible] of the eighteenth and nineteenth centuries—applied science and engineering. Some important names, dates, and events in the history of science and civilization. A short list of reference books. Index.

Note: This book is partly based on Sedgwick and Tyler *Short history of science*, New York, 1 17 [illegible] useful, brief survey of the development of the sciences to about the end of the 19th century but its treatment of the important advances made in the 20th century is inadequate. About 130 titles are cited in the bibliography

THORNDIKE LYNN

A history of magic and experimental science New York Columbia University Press 1923–41 6 v 23 cm. $8.50 per vol. 78

Contents (abridged): The first thirteen centuries of our era. Volume [illegible] The Roman Empire Early Christian thought. The early Middle Ages. Volume [illegible] The twelfth century The thirteenth century Volume III The outlook at the opening of the fourteenth century John [illegible] and the occult arts. Alchemy of the later Middle Ages. Dante, Petrarch [illegible] and Lucretius Weather records. Oriciana and his influence. Petrarch Gentile da Foligno and fourteenth century medicine Calculator and the rise of mathematical physics. Oresme Works on [illegible]. Astrology Alchemy of the late fourteenth century Volume IV [illegible] of Forma. Astrological prediction. Surgery and medicine. Giovanni da Fontana. Michael Savonarola. Theology and astrology Censors of superstition. Two liberal inquisitors. Alchemy through the fifteenth century Conrad Heingarter Humanism in relation to natural and occult science Magic in dispute The attack on Pliny Volume V [illegible] conditions and characteristics of the sixteenth century Leonardo da Vinci, "the [illegible] of the Renaissance" Cycles and chiromancy [illegible] and dreams. Pomponazzi on incantations. Agrippa and occult philosophy Varied approaches to natural philosophy Astrology of the early century The aftermath of Regiomontanus. The Copernican theory German medicine Anatomy from Carpi to Vesalius. Cardan. The Paracelsian revival. Volume VI Post-Copernican astronomy The Catholic reaction Medicine after 1550 The sixteenth century naturalists. The lore of gems. Efforts towards Christian philosophy of nature Natural philosophy and natural magic. Mystic philosophy Demons. The literature of witchcraft and magic after Wier Summary and by-products.

[illegible] scholarly work presents a detailed and documented [illegible] of the [illegible] of scientific thought and knowledge during the first [illegible] centuries of the Christian era. The work is based on an examination of the original manuscripts and documents of the early writers, scientists, and historians in library collections throughout the world. The word "magic" as used in the title is understood in [illegible] broadest sense as including all occult arts and sciences, superstitions, and folklore The author shows that magic and experimental science have been connected in the history of science, that magicians are perhaps the first to experiment, and that the history of both subjects can best be understood by studying them together The development of mysticism and its effect upon the growth of religious thought is also [illegible], and the separate histories of many of the sciences, such as astronomy physics, medicine biology and mathematics, are interwoven in the general historical pattern. There are numerous abstracts of manuscripts and [illegible] hitherto inaccessible to most scholars and the large number of references cited in footnotes constitute an exhaustive bibliography The subject of [illegible] of magic, popular practice, witchcraft and persecution, have been excluded as outside the scope of the present work Each volume contains [illegible] general index and [illegible] bibliographic index. Two additional volumes are scheduled for publication in 1957

WILSON MITCHELL

American science and invention a pictorial history The fabulous story of how American dreamers wizards and inspired

Contents Ancient Mesopotamia and the beginnings of science, by E. A. Speiser Some fundamental concepts in ancient astronomy by O. E. Neugebauer Medicine and surgery in ancient Egypt, by H. Ranke. Medieval medicine by H. E. Sigerist. The rise of modern scientific medicine, by R. H. Shryock. Two centuries of surgery by E. A. Graham. Logico-historical study of mechanism, vitalism, naturalism, by E. A. Singer The mathematical way of thinking, by H Weyl.

Note Although the subjects of these papers are scientific, the style is generally nontechnical and understandable to the layman. "Two centuries of surgery" includes a brief list of references. In some of the other papers, footnotes refer to other literature on the subject.

PERSONS, STOW, editor

Evolutionary thought in America. New York George Braziller, 1956 462 p illus 24 cm $5 00 69

Content *Part I, The theory of evolution* The rise and impact of evolutionary ideas, by R. Scoon. Evolution in its relation to the philosophy of nature and the philosophy of culture by F S. C. Northrop. The genetic nature of differences among men by T Dobzhansky *Part II Evolutionary thought in America* Evolution and American sociology by R. E. L. Faris. C. Other theories of life and of knowledge—the garden and the porch. Epilogue The end of a cycle General bibliography Index.

Note In contrast to the author's well-known *Introduction to the history of science,* this work is designed for reading rather than for reference. Its scope is almost as broad as that of the *Introduction* and the style is as erudite The content of Greek science is examined in minute detail, and the author points out numerous unexpected relationships. The subject content of the work is such that it is of interest not only to students of the history of science but also to students of archeology and anthropology Almost every page contains one or more footnotes which amplify or document points made in the main text. The general bibliography noted in the table of contents is, however only a short list of principal authorities.

TEXTBOOKS

BAWDEN, ARTHUR TALBOT

Man's physical universe a survey of physical science for colleges. Third edition. New York The Macmillan Company 1950. 822 p. illus. 22 cm. 86

Contents (abridged) The intelligent solution of problems as they arise is the price of liberty. The universe is a vast system of parts moving and changing under the influence of ... forms of energy. Continuous changes in the earth's surface have brought about conditions which make possible the life of modern man. Man has applied his knowledge of physical properties and physical changes to overcome many physical limitations. Man has discovered and harnessed different forms of energy. Energy may be propagated through the ether and through matter by means of vibrations. The applications of magnetism and electricity have greatly modified the activities of mankind. Man is conquering his material world through an ever increasing understanding of its nature. Creative chemistry has contributed greatly to man's physical progress. Man's physical welfare is the most important problem of physical science.

Note One of the more successful of the "cultural" type of introduction to science. Descriptions of applications of physics and chemistry make up most of the text, but a fair amount of space is given to geology, astronomy and other sciences. There is practically no use of mathematics, and numerous headings in bold face type, short paragraphs, readable style, and over 300 illustrations have been used to lure the unwilling student. A new edition was published in 1957 $6.25.

CHERONIS NICHOLAS D., AND OTHERS

The study of the physical world. Second edition. By Nicholas D Cheronis, James B Parsons and Conrad E. Ronneberg. Boston Houghton Mifflin Company 1950 907 p. illus. 24 cm. $6.50 87

Contents (abridged) Prelude to science. The relation of mathematics to science. The concept of time. The crumbling rocks. The water over the stones. Motion and force. The earth returns. Universal force. The moon. The planets. The sun—the agent of change. The conservation of energy. Heat engines. The electrical nature of matter. The architecture of the atom. Periodic classification of the elements. A study of chemical reactions. Carbon—the energy carrier of life. Magnetism—a manifestation of electricity. The distribution and use of electric power. The nature of sound. What is light? Messages from the stars—spectra. Theories of cosmogony. The five volumes of geological history. Index.

Note An established textbook used in college survey courses as part of ... general education program. The methods of science are stressed, and there is equal emphasis on the significance of science in the contemporary world. Most of the space is devoted to the elementary concepts and principles of physics. However the student is afforded views also of meteorology, astronomy, geology, chemistry and mathematics. In none of these fields of science being presented as having precise and fixed boundaries. The first edition was published in 1942. In this second edition, the purpose of the book is the same. However several chapters have been rearranged and revised. These include the discussions of atomic structure and of chemistry. The number of figures in the second edition is 467.

GRAY, DWIGHT E

Man and his physical world. Second edition. Princeton D Van Nostrand Company Inc., 1946 699 p. illus. 23 cm. $6.00 88

Contents (abridged) Science and the scientific method. Man and the universe. The solar system. The universe beyond the solar system. Astronomical measurements. Man and the history of the earth. Forces which change the surface of the earth. Geological history. Man and the tools of science. Units of measurement. Man and materials: The nature of matter. Air and water. Metals and alloys. Synthetics. Man and energy: Force, work, and power. Heat engines. Magnetism. Electricity and the atom. Electronics. Wave motion. Sound. Light. Man applies science: Communication. Illumination. Reading list. Index.

Note A textbook intended for use in "science survey" courses offered to college students who do not plan to study further in a scientific field. Like other books of the type, it is intended to give the student an appreciation of the basic principles, the methods, and some of the applications of the physical sciences. No previous knowledge of mathematics or science is assumed, hence the book can be understood by interested lay readers as well.

KRAUSKOPF KONRAD BATES

Fundamentals of physical science an introduction to the physical sciences. Third edition. New York McGraw Hill Book Company Inc., 1953 694 p. illus. (part col d) 23 cm. $6.25 89

Contents (abridged) The solar system. Matter and energy. The structure of matter. Fundamental processes. The biography of the earth. Stars and galaxies. Appendix. Index.

Note A standard college textbook, the first edition of which was published in 1941 and the second edition in 1948. In scope it is broader than the traditional introductory physics course as taught in American universities, and it is more representative of general science courses. One of its major parts deals with the solar system, another with stars and galaxies, and another with earth history and geology. These topics, along with the fundamentals of physics and chemistry, are presented as a unified field of knowledge. The language is simple, with a minimum of technical terms. The discussion of advanced topics, for example the quantum theory, are set in smaller type to indicate that they may be skipped in shortened courses and by readers studying the book without the guidance of an instructor. The author, a geologist, is Professor of Geochemistry in Stanford University.

tinkerers converted a wilderness into the wonder of the world New York Simon and Schuster, Inc., 1954 437 p illus 30 cm. $10 00 79

Content (abridged) Part I, Giants in the wilderness: Trades in America. The natural philosophers. Benjamin Franklin. The honest heretic, Joseph Priestley Part II, The shock of freedom Surveyors of a continent. Surveyor of the sea. The atmospheric steam engine Oliver Evans. Robert Fulton. The Erie Canal. Eli Whitney The Lowell mills. Part III, Bright dream—dark fulfillment: The naturalists. William Beaumont. Anesthesia. Joseph Henry Yankee invention and the American myth. The sewing machine. The reaper and the singing plow The steam engine rail road. Clipper ships. The Atlantic cable. Part IV The tools of war· The war telegraph. Ordnance. Iron ships of war. Part V The new era: George Mortimer Pullman. The refrigerator car George Westinghouse. Photography Astronomy Alexander Graham Bell. The wizard of Menlo Park. Part VI, The last individualists A. A. Michelson. The horseless carriage. Robert A. Millikan. The Wright brothers. Lee de Forest. The chemical industry Part VII, The new dimension: Electronics. Nucleonics. Bibliography Index.

Note A panoramic view of the development of science and technology in the United States of America is presented in this book As indicated in the title pictures are a primary feature. The number of pictures is somewhat greater than the number of pages, and they include not only pictures of machines and portraits of scientists and engineers but also cartoons, travel scenes, and a few reproductions of patents. Each picture is explained in an accompanying caption. A broad though superficial view of the development of American science and invention can be obtained by simply looking at the pictures and reading the captions. However the pictures are supplemented by biographical sketches and short essays on major trends and developments, all written in a light style designed for easy reading. The treatment is popular rather than scholarly but the sources of pictures are given, and there is a two-page bibliography of sources of textual information.

DICTIONARIES

BRAY, ALEXANDER, compiler and editor

Russian English scientific technical dictionary New York International Universities Press, 1945 550 p 24 cm $10 00 80

Note The English equivalents of approximately twenty-five thousand Russian scientific and technical words and phrases are given in this dictionary New terms and older basic terms are both included. Definitions are extremely brief and no examples of usage in sentences are included. The book is included here not for its excellence but because the scarcity of such dictionaries gives usefulness to practically any such work that includes more than a few terms.

DE VRIES, LOUIS

French English science dictionary for students in agricultural biological and physical sciences with a supplement of terms in aeronautics electronics radar, radio television Second edition New York McGraw Hill Book Company, Inc , 1951 596 p 19 cm $8 00 81

Note A standard reference book in which is contained a well-chosen selection of terms from several scientific fields and also some terms from the literary language The first edition appeared in 1940. Except for the correction of a few errors, the text of the present edition is the same to the end of page 553 However a supplement of aeronautical, electronic and communications terms—which runs from page 555 to page 584—has been added.

DE VRIES, LOUIS

German English science dictionary for students in chemistry physics biology, agriculture and related sciences with the collaboration of members of the Graduate Faculty Second edition, revised and enlarged New York McGraw Hill Book Company, Inc 1946 558 p 18 cm $6 50 82

Note. The first edition of this compilation is well known to science librarians and translators. In this second edition, the dictionary proper has been enlarged by 64 pages, representing approximately 6,000 additional terms. Other new material includes a list of geographical names and terms derived from them, tables of the elements, measurements and conversion factors. Both the list of reference works and the list of abbreviations have been expanded and improved. As the change in the title indicates, more chemical terms have been included, but the work still contains a well-rounded list of scientific and technical terms without marked specialization in any one branch.

INTERNATIONAL ENCYCLOPEDIA OF UNIFIED SCIENCE. Edited by Otto Neurath, Rudolf Carnap, and Charles Morris Chicago University of Chicago Press, 1938–55 1 vol in 2 pts 23 cm. Vol I, pt. I, vol. I, pt. II, $6 00 each part, $11 00 the set. 83

Contents Part I, Encyclopedia and unified science by O. Neurath and others. Foundations of the theory of signs, by C. W Morris. Foundations of logic and mathematics, by R. Carnap. Linguistic aspects of science, by L. Bloomfield. Procedures of empirical science, by V F Lenzen. Part II, Principles of the theory of probability by E. Nagel. Foundations of physics, by P Frank. Cosmology by E. Finlay-Freundlich. Foundations of biology by F Mainx. The conceptual framework of psychology by E. Brunswik. Bibliographical notes.

—— Vol 2, Nos. 1, 4–5, 7–9 24 cm. Nos. 1, 4 5, $1 25 each part, no 7, $2 00, no 8, $1 25, no 9, $2 00 84

Content Foundations of the social sciences, by O Neurath. Theory of valuation, by J Dewey The technique of theory construction, by J H. Woodger Fundamentals of concept formation in empirical science by C. G. Hempel. The development of rationalism and Empiricism, by G de Santillana and E. Zilsel. The development of logical empiricism, by J Joergensen.

Note Conceived as a "model of science this still incomplete work has as its purpose the bringing together of "material pertaining to the scientific enterprise as a whole. Its stated aim is "to integrate the scientific disciplines, so to unify them, so to dovetail them together that advances in one will bring about advances in the others." It will consist of individual monographs written for it but constituting individual studies of particular problems or groups of problems. Eventually a detailed analytical index will be published. The monographs listed above have been published up to the time of the writing of this note Volume I was complete, and is offered in two permanently bound parts. Volume II, the second of two planned introductory volumes, was still incomplete as noted.

VAN NOSTRAND S SCIENTIFIC ENCYCLOPEDIA aeronautics astronomy botany, chemical engineering chemistry, civil engineering, electrical engineering electronics & radio geology mathematics mechanical engineering medicine, metallurgy meteorology, mineralogy, navigation photography physics statistics zoology Second edition Princeton D Van Nostrand Company Inc. 1947 1,600 p illus. 26 cm 85

Note More than 11,000 terms selected from the fields of science and technology named in the subtitles given above are defined in this standard reference work. Definitions range from only a few lines for such terms as "mole cricket to two or more pages on such topics as "radar Definitions and articles are signed. A fair amount of illustrative matter and tabular data is included. A third edition was published early in 1958, $30.00.

Contents: Points of view. Mathematical truth. Breaking bounds. The same, yet not the same. The art of abstraction. Odds from evens. Personal thinking. Landmarks old and new. Groups. A natural universe. The queen of mathematics. Abstraction and generation. From Cyclops to Neptune. Two kinds of picture. The chief instrument of applied mathematics. Further excursions. Waves and ripples. Order and chance. Pursuing the heavens. Retrospect. Index.

Note: A lively popular account of the history and basic concepts of mathematics. It is not a "mathematics-made-easy" popularization, but it is designed for general reading and is so planned and written that the general reader who has no mathematical bent will be inclined to read it to the end. The author has used material from his *The queen of the sciences*, 1931 and *The handmaiden of the sciences* (1937) but by revision and amplification, together with reorganization, he has produced what is essentially a new work.

BELL, ERIC TEMPLE

Men of mathematics. New York Simon and Schuster 1937 592 p. illus 24 cm. $6 50 96

Contents: Introduction. Modern minds in ancient bodies: Zeno (fifth century B.C.) Eudoxus (408–355 B.C.) Archimedes (287?–212 B.C.) Gentleman, soldier and mathematician: Descartes (1596–1650). The prince of amateurs: Fermat (1601–1665) Greatness and misery of man: Pascal (1623–1662) On the seashore: Newton (1642–1727) Master of all trades: Leibniz (1646–1716) Nature or nurture?—the Bernoullis (seventeenth and eighteenth centuries) Analysis incarnate: Euler (1707–1783) A lofty pyramid: Lagrange (1736–1813) From peasant to snob: Laplace (1749–1827) Friends of an emperor: Monge (1746–1818) Fourier (1768–1830) The day of glory: Poncelet (1788–1867) The prince of mathematicians: Gauss (1777–1855) Mathematics and windmills: Cauchy (1789–1857) The Copernicus of geometry: Lobatchewsky (1793–1856) Genius and poverty: Abel (1802–1829) The great algorist: Jacobi (1804–1851) An Irish tragedy: Hamilton (1805–1865) Genius and stupidity: Galois (1811–1832) Invariant twins: Sylvester (1814–1897) Cayley (1821–1895) Master and pupil: Weierstrass (1815–1897) Sonja Kowalewski (1850–1891) Complete independence: Boole (1815–1864) The man, not the method: Hermite (1822–1901) The doubter: Kronecker (1823–1891) Anima candida: Riemann (1826–1866) Arithmetic the second: Kummer (1810–1893) Dedekind (1831–1916) The last universalist: Poincaré (1854–1912) Paradise lost? Cantor (1845–1918) Index.

Note: The chapters of this book are essentially independent sketches of the mathematicians whose names are given in the chapter titles. The book becomes a kind of history of mathematics by virtue of its chronological arrangement. Details of the personal lives of the subjects and explanations and interpretations of their work are combined in the individual essays. There is somewhat more emphasis on a man's mathematical contributions than on his personal life but the latter is not neglected. The author's style is lively and eminently readable, and his interpretations of mathematical advances are sound.

BENTLEY, ARTHUR FISHER

Linguistic analysis of mathematics. Evanston Principia Press of Illinois 1932 315 p. illus 22 cm. $3.00. 97

Contents: Part I, Problem and postulates. The problem. Semantic postulation. Linguistic materials and control. Part II, Examination of mathematics as language. Character and symbol. Word-clusters lacking consistency. The semantic M-T and M-O. Kasner and [illegible]. The semantic number sequences. Brouwer. Relations and operations. Hermann Weyl. A Postulation for geometry. The denumerability of decimals. Null as "Zahl." Part III, Knowledge and logic. Semantic analysis. Reconstructions of logic. Conclusion.

Note: A study in the semantics of mathematics and logic for the advanced reader. The three great historic branches of mathematics, algebra, geometry, and analysis, are explored as semantic fields, and an analysis made of symbols and their meanings.

BIRKHOFF, GEORGE DAVID

Collected mathematical papers. New York American Mathematical Society 1950. 3 v 24 cm. $18.00 98

Note: Professor G. D. Birkhoff, one of the great mathematicians of the first half of the 20th century, published his research papers widely in journals in all parts of the world. These three volumes contain all of his published mathematical work except his published books and certain articles, such as reviews and others, which do not have permanent interest.

BOYER, CARL B

History of analytic geometry New York Scripta Mathematica, Yeshiva University 1956 291 p. illus 25 cm (The Scripta Mathematica studies. Nos. 6 and 7) $6 00. 99

Contents: The earliest contributions. The Alexandrian age. The medieval period. The early modern prelude. Fermat and Descartes. The age of commentaries. From Newton to Euler. Definitive formulation. The Golden Age. Analytical bibliography. Index.

Note: In this history of analytic, or coordinate, geometry the author has paid most attention to tracing the development of concepts. Essentially no information is given on the personalities of the mathematicians themselves, although the influence of the work of individuals is indicated in such passages as the following: "The work of Euler may be said to mark a turning point in the development of analytic geometry in several respects," and, "Descartes and Fermat had invented the methods, but Wallis gave the first systematic application of them to the study of the conic sections." Literature references are given in the form of footnotes throughout the text and also in the bibliography at the end of the volume. The latter list includes brief explanatory annotations. The book is a readable and adequate history of analytic geometry to approximately the close of the 18th century. The great developments of the 19th century are outlined but not presented in detail in the chapter entitled "The Golden Age."

COURANT, RICHARD AND HERBERT ROBBINS

What is mathematics? an elementary approach to ideas and methods New York Oxford University Press, 1941 521 p illus 23 cm. $7.50 100

Contents (abridged): What is mathematics? The natural numbers. The theory of numbers. The number system of mathematics. The algebra of sets. Geometrical constructions. The algebra of number fields. Projective geometry. Axiomatics. Non-Euclidean geometries. Topology. Functions and limits. Maxima and minima. The calculus. Appendix. Suggestions for further reading. Index.

Note: A simplified approach to the theory and appreciation of mathematics which avoids the usual textbook presentation. It is intended for teachers as well as general readers and college students.

EVES, HOWARD

An introduction to the history of mathematics New York Rinehart and Company Inc., 1956 422 p. illus 23 cm. $6.00 101

Contents: Part I, Before the seventeenth century: Number systems. Babylonian and Egyptian mathematics. Pythagorean mathematics. Duplication, trisection, and quadrature. Euclid's elements. Greek mathematics after Euclid. Hindu and Arabian mathematics. European mathematics, 500 to 1600. Part II, Later European mathematics, with especial emphasis on the seventeenth century: The dawn of modern mathematics. Analytic geometry and other pre-calculus developments. The calculus and related concepts. Transition to the twentieth century. Appendix. General bibliography. A chronological table. Answers and suggestions for the solution of the problem studies. Index.

Note: A history of elementary mathematics—that is, mathematics up to and including calculus—designed as a text for the lower years of undergraduate college students. The primary emphasis is on concepts and techniques rather than on personalities of mathematicians. However, some biographical information is included. An unexpected feature is the inclusion of problems for students to solve. References to books are included at the ends of chapters. The book is not written in a style that invites straightforward reading, and therefore its uses are limited to organized instruction and to reference.

GALOIS INSTITUTE OF MATHEMATICS, LONG ISLAND UNIVERSITY

Galois lectures. Addresses delivered by Jesse Douglas, Philip Franklin, Cassius Jackson Keyser, Leopold Infeld at the Galois In-

MATHEMATICS

GENERAL AND POPULAR WORKS

ANDERSON, RAYMOND W

Romping through mathematics Illustrated by Harry Zarchy New York Alfred A Knopf, 1948 152 p illus 21 cm $3 00 90

Contents As easy as one, two, three—arithmetic. The weighing balances—algebra. Egyptian rope-stretchers—geometry Long distance if you please—logarithms. The parable of "nickels in the gutter"—probabilities. A three-cornered tale—trigonometry Mathematics on the checkerboard—analytic geometry Flying off on calculated tangent—differential calculus. The ticking hair flipper—integral calculus. The rompers' timetable—review

Note An entertaining account of the development of mathematics through the ages to the present day From arithmetic to calculus the elements of mathematics are carefully presented in manner easily understood by the layman. Sketches, diagrams, charts, and numerous worked examples are included, but there are no problems for the reader to solve.

ARCHIBALD, RAYMOND CLARE

Mathematical table makers portraits, paintings, busts, monuments bio-bibliographical notes New York Scripta Mathematica Yeshiva University 1948 82 p illus 25 cm (The Scripta Mathematica studies Number three) $2 00 91

Note For each of the 53 men listed in this reference book the following information is given condensed biographical sketch directory of the known portraits, paintings, busts, monuments, or reproductions of them bibliography of biographical articles and books and list of his published mathematical tables. Portraits, reproduced from photographs of 20 men, are included.

ARCHIBALD, RAYMOND CLARE

A semicentennial history of the American Mathematical Society 1888–1938 With biographies and bibliographies of the past presidents New York American Mathematical Society 1938 2 v illus 26 cm v 1 $3 00 v 2, $4 50 92

Contents Volume I, History Introductory The Society 1888 1920 1921 1938 Financial affairs Special funds. The *Bulletin*, *Transactions*, *Colloquium lectures* and *Colloquium publications*. The Chicago group and the Chicago section Annual meetings Summer meetings Josiah Willard Gibbs lectureship. The library The council and board of trustees The secretaries The vice-presidents The presidents. Index Volume II, Addresses Fifty years of algebra in America 1888 1938 by E T Bell Algebraic aspects of the theory of differential equations, by J F Ritt The historical background of harmonic analysis, by Norbert Wiener Recent developments in the calculus of variations, by E J McShane Recent trends in geometry by T Y Thomas The sphere in topology by R. L Wilder Dirichlet problems, by G C Evans. Hydrodynamical stability by J L Synge. Fifty years of American mathematics, by G. D Birkhoff

Note In order to give definite suggestion as to the mathematical research of the outstanding men of the period 1888–1938 and to present background for the history of the Society condensed biographies and complete bibliographies are brought together for the group of past presidents of the Society in Volume I, together with brief history of the Society activities in the period indicated. Volume II contains brief treatises on eight representative subjects and historical summary of American contributions to mathematics during the same period, some of the papers being purely chronological and others concerned chiefly with recent developments. The work is intended to reveal what has been accomplished in America since the founding of the Society and to acquaint mathematicians with current problems and research in many fields. Lists of references follow most of the papers in Volume II, and there are portraits of former presidents of the Society in the first volume.

BAKST, AARON

Mathematics, its magic and mastery Second edition Princeton D Van Nostrand Company, Inc., 1952 790 p illus. 24 cm. $7 50 93

Contents (abridged) Numerals and numeration. Systems of numeration. Some remarkable properties of numbers. The arithmetic of measurement. Simple calculating devices. Problems and puzzles. How the number magician does it. The algebra of number giants and pygmies. Algebra, boss of arithmetic. Streamlining everyday computation. How to have fun with lady luck. The thinking machines The triangle—man's master Circles, angles, and an age-old problem. The mathematics of seeing. The shape of things. The size of things How algebra serves geometry Cork-screw geometry Mathematics, interpreter of the universe. Of math and magic. Appendix Algebra. Geometry Trigonometry Tables. Approximate formulas for simplified computation Index.

Note. An informal treatment of the science of mathematics designed to appeal to the intelligent layman. Although intended mainly for the reader's amusement it is sufficiently inclusive to stimulate the interest of some readers in mathematical fundamentals Proofs in the mathematical sense of the term are not included The book is replete with the kind of applications of mathematics often referred to as mathematical recreations. In many instances these are used not only to entertain but also to teach mathematical principle or illustrate an application. The first edition was published in 1941 In this second edition, discovered errors have been corrected and there are few other revisions, but the chapter titles and pagination are identical with the first edition

BELL, ERIC TEMPLE

The development of mathematics Second edition. New York McGraw Hill Book Company Inc 1945 637 p 23 cm. $8 00 94

Contents General prospectus. The age of empiricism. Firmly established. The European depression. Detour through India, Arabia, and Spain *Four centuries of transition, 1202 1603.* The beginning of modern mathematics, 1637 1687 Extensions of number Toward mathematical structure. Arithmetic generalized. Emergence of structural analysis Cardinal and ordinal to 1902 From intuition to absolute rigor 1700–1900. Rational arithmetic after Fermat. Contributions from geometry The impulse from science. From mechanics to generalized variables. From applications to abstractions. Differential and difference equations. Invariance. Certain major theories of functions. Through physics to general analysis and abstractness Uncertainties and probabilities. Notes. Index.

Note. A broad account of the main principles, methods, and theories of mathematics that have survived and are still considered vital in the science It is written not for general reading but for persons who have studied mathematics at least through calculus, and its appeal is chiefly to advanced students and graduates who seek perspective view of the growth of the science. Although this edition is some fifty pages longer than the first the chapter titles are unchanged and the revisions are found chiefly in expanded discussions of variety of topics scattered throughout the book.

Contents [illegible]

stitute of Mathematics, Long Island University, Brooklyn, N Y New York Scripta Mathematica, Yeshiva College, 1941 124 p illus. 20 cm (The Scripta Mathematica library No 5) $1 25 102

Contents *Survey of the theory of integration* by Jesse Douglas. The four color problem, by Philip Franklin. Charles Sanders Peirce as pioneer by Cassius Jackson Keyser The fourth dimension and relativity by Leopold Infeld.

Note The first paper in this collection covers the Riemann integral, the Stieltjes integral, the Lebesgue integral and the *Denjoy* integral. The four color problem is study in combinatorial topology which concludes that since the problem has not been solved it is not known whether it is true or not in mathematical sense. The biographical sketch of Peirce (1839–1914) the American logician, mathematician and philosopher deals briefly with some of his accomplishments. The final paper is a transcript of radio broadcast which attempts to explain to the layman the concept of a static picture of motion existing in a four-dimensional continuum.

JAMES, GLENN, AND ROBERT C JAMES, editors

Mathematics dictionary, by Armen A Alchian, Edwin F Beckenbach, Clifford Bell, Homer V Craig Glenn James, Robert C. James, Aristotle D Michal, and Ivan S Sokolnikoff Princeton D Van Nostrand Company, Inc., 1949 432 p illus 24 cm. $10 00 103

Note A standard reference book for mathematicians, students, engineers, and others who use mathematics in their professions. The older editions provided definitions of words and terms in the range beginning with arithmetic and extending through calculus. The new edition adds definitions of the basic terms in the following fields metric differential geometry theory of functions of real and complex variables, advanced calculus, differential equations, theory of groups, theory of matrices, theory of summability point-set topology general analysis, analytic mechanics, and theory of potential. Also included is an extensive coverage of statistical terms. Generally speaking, *definitions are expressed in technical terminology not intended* for the uninitiated layman.

JONES, BURTON WADSWORTH

Elementary concepts of mathematics New York The Macmillan Company 1947 294 p illus 22 cm $4.85 104

Contents Logic. The positive integers and zero. Negative integers, rational and irrational numbers. Algebra. Graphs and averages. Permutations, combinations, and probability Mirror geometry Lorentz geometry Topology Bibliography Index.

Note The reader of this book is introduced to a considerable variety of mathematical concepts, which are explained clearly and even entertainingly The book was originally prepared for freshman classes in Cornell University but it is also suitable for self-instruction purposes. There are numerous puzzles, games, and exercises to be worked, as well as bibliography of books for further study The only prerequisite demanded is knowledge of arithmetic and plane geometry

JONES, SAMUEL ISAAC

Mathematical clubs and recreations Nashville S I Jones Company, 1940 236 p illus. 19 cm $3 00 105

Contents Part I, Mathematical clubs Their purpose. History and development. Organization Results obtained. Stimulating interest. A mathematical atmosphere necessary Aids in creating this atmosphere. Club or classroom. Neatness. The math teacher's aim. The appreciation of beauty in the geometric forms of nature and art. Nature and preparation of program. Suggestive programs. Recreations and their use. Social activities. Constitution. Books for club libraries. Part II, Recreations Amusements in mathematics. Brain teasers. Brain nuts. Curious tables. Multiplication oddities. Number rhymes. Games. List of games. Puzzles and riddles. Fallacies. Perpetual calendar Calendar magic. Magic squares. Producing cubes by addition. Bible tests. Part III, Solutions to recreations Solutions to amusements in mathematics. Solutions to brain teasers. Solutions to brain nuts. Solutions to puzzles and riddles. Solutions to Bible tests. Index.

Note. A manual for the organizing and conduct of mathematics clubs, and a collection of mathematical recreations. It is the aim of the author to stimulate interest in the recreational and curious aspects of mathematics which are not included in the elementary courses in the subject. Puzzles, brain teasers, and mathematical stunts of various kinds are included.

JONES, SAMUEL ISAAC

Mathematical nuts for lovers of mathematics Nashville Samuel I Jones, *1932* 340 p illus 20 cm $3.50 106

Contents Nuts for young and old. Nuts for the fireside. Nuts for the classroom. Nuts for the math club. Nuts for the magician. Nuts for the professor *Nuts for the doctor* *Nuts cracked for the weary* Nut kernels. Index.

Note. An extensive collection of mathematical problems and puzzles of various kinds, designed for teachers, students, and mathematical hobbyists. The author has also compiled *Mathematical wrinkles*, Nashville, 1939 376 p., $3.50.

KARPINSKI, LOUIS CHARLES

Bibliography of mathematical works printed in America through 1850, with the cooperation for Washington libraries of Walter F Shenton Ann Arbor The University of Michigan Press, *1940* *697 p* illus. 28 *cm* $10 00 107

Contents Preface. List of illustrations. Introduction The British background. Mathematics in the Americas—the present bibliography Previous bibliographical lists. Methods employed in the present list. Abbreviations of names of libraries and of other sources represented in the location of copies. Bibliographical list of books, pamphlets, and broadsides. Sixteenth-century publications. Seventeenth-century publications. Eighteenth-century publications. Publications from 1801 to 1850, inclusive. Entry titles—Works whose publication is problematical. Encyclopedias and encyclopedic reference works. Journals and newspapers with mathematical articles. Appendix Native American mathematical developments. Works consulted. Indexes: General index. Topical indexes. Works dealing with algebra. Works dealing with analytic geometry and conic sections. Works dealing with arithmetic. Works dealing with calculus. Games and puzzles. Works dealing with geometry and mensuration. Historical, biographical, and philosophical works. Works dealing with mechanics and optics. Practical navigators. Works dealing with surveying. Works dealing with trigonometry Tables, ready reckoners, and works dealing with logarithms, the slide rule, and mathematical instruments. General works on mathematics. Index of non-English and Canadian works: Choctaw Dutch. French. German. Hawaiian. Portuguese. Spanish and Latin. Canadian. Index of printers and publishers.

Note Over 1,000 titles and about 3,000 editions are listed in chronological order and about 900 cuts of title and specimen pages illustrate the text. The compiler aims to make complete the list of Spanish-American books to 1800 and of those published in the United States and Canada to 1850. There is also record of entry titles submitted to the U S. Copyright Office, the actual publication of which is problematical.

KASNER, EDWARD, AND JAMES NEWMAN

Mathematics and the imagination With drawings and diagrams by Rufus Isaacs. New York Simon and Schuster, 1940 380 p illus. 21 cm. $3 95 108

Contents New names for old. Beyond the googol. π, (Pie) Assorted geometries—plain and fancy Pastimes of past and present times. Paradox lost and paradox regained. Chance and chanceability Rubber-sheet geometry Change and changeability Epilogue. Mathematics and the imagination. Bibliography Index.

Note A stimulating discussion of some of the more unusual aspects of mathematics, including some of the classic paradoxes as well as some of the problems proposed by modern mathematics, involving the postulates of topology or analysis situs. The presentation is not oversimplified although there are no formal theories developed, and many of the mathematical ideas involved are illustrated with pictorial drawings. Footnotes to each chapter give additional references, further explanations where needed, and related problems. No formal knowledge of mathematics is required, but an interest in the subject is assumed.

KERSHNER, RICHARD B., AND L. R. WILCOX

The anatomy of mathematics. New York The Ronald Press Company 1950 416 p illus. 23 cm. $7.00. 109

Contents (abridged) Language. The development of mathematics. The primitive materials of mathematics. Further materials of mathematics. The postulational method. Groups. The positive integers. Fundamental relations on the positive integers. Extended operations and applications. Infinite sets. Isomorphism and categorical systems of axioms. Equivalence and order relations. The positive rational numbers. One-dimensional continua. Fields. Conclusion. Appendix. Suggestions and answers for the projects. Index.

Note The authors describe this book as "a treatise on the axiomatic method." The hint in the title should also be noted. The two ideas can be combined by stating that in the book certain concepts and methods of proof of abstract mathematics are dissected, and axioms are thereby revealed to be the true anatomy of mathematics. The first six chapters are largely "non-mathematical" and can be read by any interested person who can follow mature prose. Beginning with chapter seven, the going becomes more strenuous. The readers of the book include advanced students who are preparing to specialize in mathematics and lay readers who pursue mathematics for the pleasure of it.

KEYSER, CASSIUS JACKSON

Mathematics as a culture clue, and other essays. The collected works. Volume 1. New York Scripta Mathematica, Yeshiva University 1947 277 p illus. 21 cm. $3.75 110

Contents The meaning of mathematics. The bearings of mathematics. Mathematics as a culture clue. Scientific teach laymen. The nature of the doctrinal function and its role in rational thought. Mathematics and the science of semantics. A glance at some of the ideas of Charles Sanders Peirce. William Benjamin Smith. Mathematics and the dance of life. Three great synonyms: Relation—transformation—function. Vilfredo Federico Damaso Pareto. Mathematics [illegible]. Panthetica.

Note A series of essays dealing informally and lucidly with the philosophical, historical, biographical, didactic and disciplinary aspects of mathematics. The writings were assembled by the author's friends both as tribute to him and in order to make them available for the use and enjoyment of larger groups of readers.

KEYSER, CASSIUS JACKSON

Mathematics and the question of cosmic mind, with other essays. New York Published by Scripta Mathematica, Yeshiva College, 1935 121 p illus. 19 cm. (The Scripta Mathematica library No. 2) $1.25 111

Contents The meaning of mathematics. The bearings of mathematics. Mathematics and the question of the cosmic mind. Mitigating the tragedy of our modern culture. On the study of legal science. William Benjamin Smith. Index.

Note A series of six essays reprinted with alterations from *The American scholar*, *Scripta mathematica*, and the *Yale Law Journal*. The first three essays constitute a logical sequence, and should be read in order. Logical acumen, rather than mathematical knowledge or aptitude, is required for their understanding.

KLINE, MORRIS

Mathematics in western culture. New York Oxford University Press, 1953 484 p. illus. 23 cm. $7.50. 112

Contents (abridged) Introduction. True and false conceptions. The birth of the mathematical spirit. Placing a yardstick to the stars. Renewal of the mathematical spirit. Science born of art—perspective geometry. The deduction of universal laws. Grasping the fleeting instant—the calculus. The Newtonian influence—science and philosophy—religion—literature and aesthetics. Mastery of the ether waves. The science of human nature. Prediction and probability. Our disorderly universe—the statistical view of nature. The theory of relativity. Selected references. Index.

Note An interpretation of mathematics as one of the primary elements in the culture of the Western World. As shown by the chapter titles, the organization is primarily chronological in accordance with the development of mathematics, and the book can be read as an informal history of the chief landmarks in mathematical thought. However, the primary thesis is the influence of this thought on not only religion, philosophy, art, etc., but on the whole culture. The author's views are interesting, and his style is not difficult to read. The book is for educated laymen, students of the history of civilization, and mathematicians who are interested in the general implications of their science.

KOKOMOOR, FRANKLIN WESLEY

Mathematics in human affairs. New York Prentice-Hall, Inc., 1942 754 p. illus. 23 cm. (Prentice-Hall mathematics series A. A. Bennett, editor) $6.25 113

Contents The social function of mathematics. A world of approximations. Shape and size. Arithmetic comes of age. Widening the system and its symbolism. Equations on duty. Families of equations. Problems of dependence. Calculating the inaccessible. Interrelations of angles and sides. Sidestepping clumsy calculations. Chains of related numbers. Pocketbook mathematics. Yardsticks of chance. Picturing functional relation. Rules and tools of geometry. Handling statistical data. Changeable rates of change. The notion of integration. The way ahead. Appendix (tables). Glossary of symbols. Index.

Note This book is designed for the layman and beginning college student. The treatment combines discussions of the history and cultural aspects of mathematics with expositions of mathematical principles, study guides, and exercises for self-instruction.

KRAITCHIK, MAURICE

Mathematical recreations. Second revised edition. New York Dover Publications Inc., 1953 330 p. illus. 22 cm. $1.75 114

Contents Preface. Mathematics without numbers. Ancient and curious problems. Numerical pastimes. Arithmetico-geometrical questions. The calendar. Probabilities. Magic squares. Geometric recreations. Permutational problems. The problem of the queens. The problem of the knight. Games. Index.

Note This book brings together a great variety of the most famous and many of the least-known of mathematical games, riddles, and puzzles. It is based on a course of lectures given at the New School for Social Research, New York, in 1941 and may be regarded as a revised edition of the author's *La Mathématique des Jeux*, Brussels, 1930. This edition is essentially a reprint of the original edition, New York, Norton, 1942.

KRAMER, EDNA ERNESTINE

The main stream of mathematics. New York Oxford University Press, 1951 321 p. illus. 22 cm. $5.00 115

Contents Mathematical genesis. Nature, art, and geometry. The binding energy of thought. The mathematics of the forbidden. The human equation. Ascent without modern. The father of modern mathematics and his legacy. Science and the sweepstakes. The distaff side. A world in flux. From Alice to Einstein. The realm of relativity. The paradise of mathematicians.

Note The first several pages of this excellent book for lay readers are devoted to the Hindu legend about Lilavati, daughter of Bhaskara, whose name is attached to the Hindu mathematical work in which our number system is first clearly set forth. The last pages are devoted to Zeno's famous paradoxes on motion and the concept of infinity. In between, there is considerably more narrative than mathematical equations; nevertheless, the development of mathematics is skillfully outlined, and some of its major concepts are made as clear as they can be made to the nonmathematical mind.

LIEBER, LILLIAN (ROSANOFF)

Infinity With drawings by Hugh Gray Lieber New York Rinehart & Company Inc., 1953 359 p illus. 20 cm. $5.00. 116

Contents Our good friend SAM. Infinity in the physical world—in mathematics. More about "potential" infinity. Non-Euclidean geometries. Actual infinity. A still greater "actual" infinity! The continuum of real numbers. How to go from $\aleph_0$ to c. Operations on transfinites. Higher dimensions. A hierarchy of infinities! A brief summary. Is it legitimate? Some very interesting infinite sets. Applications—Zeno et al. The calculus of Newton and Leibniz. Areas. The fundamental theorem of the integral calculus.

stitute of Mathematics Long Island University, Brooklyn, N Y New York Scripta Mathematica, Yeshiva College, 1941 124 p. illus 20 cm (The Scripta Mathematica library No. 5) $1.25 102

Contents Survey of the theory of integration, by Jesse Douglas. The four color problem, by Philip Franklin. Charles Sanders Peirce as pioneer by Cassius Jackson Keyser The fourth dimension and relativity by Leopold Infeld.

Note The first paper in this collection covers the Riemann integral, the Stieltjes integral, the Lebesgue integral, and the Denjoy integral. "The four color problem" is a study in combinatorial topology which concludes that since the problem has not been solved it is not known whether it is true or not in a mathematical sense. The biographical sketch of Peirce (1839–1914) the American logician, mathematician, and philosopher deals briefly with some of his accomplishments. The final paper is a transcript of a radio broadcast which attempts to explain to the layman the concept of a static picture of motion existing in a four-dimensional continuum.

James, Glenn, and Robert C James, editors

Mathematics dictionary, by Armen A Alchian, Edwin F Beckenbach, Clifford Bell, Homer V Craig Glenn James Robert C James Aristotle D Michal and Ivan S Sokolnikoff Princeton D Van Nostrand Company Inc., 1949 432 p illus 24 cm $10 00 103

Note. A standard reference book for mathematicians, students, engineers, and others who use mathematics in their professions. The older editions provided definitions of words and terms in the range beginning with arithmetic and extending through calculus. The new edition adds definitions of the basic terms in the following fields: metric differential geometry theory of functions of real and complex variables, advanced calculus, differential equations, theory of groups, theory of matrices, theory of summability point-set topology general analysis, analytic mechanics, and theory of potential. Also included is an extensive coverage of statistical terms. Generally speaking, definitions are expressed in technical terminology not intended for the uninitiated layman.

Jones, Burton Wadsworth

Elementary concepts of mathematics New York The Macmillan Company, 1947 294 p illus 22 cm. $4 85 104

Contents Logic. The positive integers and zero. Negative integers, rational and irrational numbers. Algebra. Graphs and averages. Permutations, combinations, and probability Mirror geometry Lorentz geometry Topology Bibliography Index.

Note The reader of this book is introduced to a considerable variety of mathematical concepts, which are explained clearly and even entertainingly The book was originally prepared for freshman classes in Cornell University but it is also suitable for self-instruction purposes. There are numerous puzzles, games, and exercises to be worked, as well as a bibliography of books for further study. The only prerequisite demanded is a knowledge of arithmetic and plane geometry

Jones, Samuel Isaac

Mathematical clubs and recreations. Nashville S I Jones Company, 1940 236 p illus. 19 cm. $3 00 105

Contents Part I, Mathematical clubs. Their purpose. History and development. Organization. Results obtained. Stimulating interest. A mathematical atmosphere necessary Aids in creating this atmosphere. Club or classroom. Neatness. The math teacher's aim. The appreciation of beauty in the geometric forms of nature and art. Nature and preparation of program. Suggestive programs. Recreations and their use. Social activities. Constitution. Books for club libraries. Part II Recreations Amusements in mathematics. Brain teasers. Brain nuts. Curious tables. Multiplication oddities. Number rhymes. Gems. List of games. Puzzles and riddles. Fallacies. Perpetual calendar Calendar magic. Magic squares. Producing cubes by addition. Bible tests. Part III, Solutions to recreations Solutions to amusements in mathematics. Solutions to brain teasers. Solutions to brain nuts. Solutions to puzzles and riddles. Solutions to Bible tests. Index.

Note A manual for the organizing and conduct of mathematics clubs, and a collection of mathematical recreations. It is the aim of the author to stimulate interest in the recreational and curious aspects of mathematics which are not included in the elementary courses in the subject. Puzzles, brain teasers, and mathematical stunts of various kinds are included.

Jones, Samuel Isaac

Mathematical nuts for lovers of mathematics Nashville Samuel I Jones, 1932 340 p illus 20 cm $3.50 106

Content Nuts for young and old. Nuts for the fireside. Nuts for the classroom. Nuts for the math club. Nuts for the magician. Nuts for the professor Nuts for the doctor Nuts cracked for the weary Nut kernels. Index.

Note An extensive collection of mathematical problems and puzzles of various kinds, designed for teachers, students, and mathematical hobbyists. The author has also compiled *Mathematical wrinkles, Nashville, 1929 374 p., $3.50.*

Karpinski, Louis Charles

Bibliography of mathematical works printed in America through 1850, with the cooperation for Washington libraries of Walter F Shenton Ann Arbor The University of Michigan Press, 1940 697 p illus. 28 cm. $10 00 107

Contents Preface. List of illustrations. Introduction The British background. Mathematics in the Americas—the present bibliography Previous bibliographical lists. Methods employed in the present list. Abbreviations of names of libraries and of other sources represented in the location of copies. Bibliographical list of books, pamphlets, and broadsides. Sixteenth-century publications. Seventeenth-century publications. Eighteenth-century publications. Publications from 1801 to 1850, inclusive. Entry titles—Works whose publication is problematical. Encyclopedias and encyclopedic reference works. Journals and newspapers with mathematical articles. Appendix Native American mathematical developments. Works consulted. Indexes General index. Topical indexes. Works dealing with algebra. Works dealing with analytic geometry and conic sections. Works dealing with arithmetic. Works dealing with calculus. Games and puzzles. Works dealing with geometry and mensuration. Historical, biographical, and philosophical works. Works dealing with mechanics and optics. Practical navigators. Works dealing with surveying. Works dealing with trigonometry Tables, ready reckoners, and works dealing with logarithms, the slide rule, and mathematical instruments. General works on mathematics. Index of non-English and Canadian works Choctaw Dutch. French. German. Hawaiian Portuguese. Spanish and Latin. Canadian. Index of printers and publishers.

Note Over 1,000 titles and about 3,000 editions are listed in chronological order and about 900 cuts of title and specimen pages illustrate the text. The compiler aims to make complete the list of Spanish-American books to 1800 and of those published in the United States and Canada to 1850. There is also a record of entry titles submitted to the U S. Copyright Office, the actual publication of which is problematical.

Kasner, Edward, and James Newman

Mathematics and the imagination With drawings and diagrams by Rufus Isaacs. New York Simon and Schuster, 1940 380 p illus 21 cm. $3 95 108

Contents. New names for old. Beyond the googol. π, i, (Pie) Assorted geometries—plain and fancy Pastimes of past and present times. Paradox lost and paradox regained. Chance and chanceability Rubber-sheet geometry Change and changeability Epilogue. Mathematics and the imagination. Bibliography Index.

Note A stimulating discussion of some of the more unusual aspects of mathematics, including some of the classic paradoxes as well as some of the problems proposed by modern mathematics, involving the postulates of topology or analysis situs The presentation is not oversimplified although there are no formal theories developed, and many of the mathematical ideas involved are illustrated with pictorial drawings. Footnotes to each chapter give additional references, further explanations where needed, and related problems. No formal knowledge of mathematics is required, but an interest in the subject is assumed.

KERSHNER, RICHARD B., AND L. R. WILCOX

The anatomy of mathematics. New York The Ronald Press Company 1950 416 p. illus. 23 cm. $7.00. 109

Contents (abridged) Language. The development of mathematics. The primitive materials of mathematics. Further materials of mathematics. The postulational method. Groups. The positive integers. Fundamental relations on the positive integers. Extended operations and applications. *Infinite sets.* Isomorphism and categorical systems of axioms. Equivalence and order relations. The positive rational numbers. One-dimensional continua. *Fields.* Conclusion. Appendix: Suggestions and answers for the problems. Index.

Note: The authors describe this book as "a treatise on the axiomatic method." The hint in the title should also be noted. The two ideas can be combined by stating that in the book certain concepts and methods of proof of abstract mathematics are dissected, and means are thereby revealed to be the true anatomy of mathematics. The first six chapters are largely "non-mathematical" and can be read by any interested person who can follow mature prose. Beginning with chapter seven, the going becomes more strenuous. The readers of the book include advanced students who are preparing to specialize in mathematics and lay readers who pursue mathematics for the pleasure of it.

KEYSER, CASSIUS JACKSON

Mathematics as a culture clue, and other essays. The collected works. Volume 1 New York Scripta Mathematica, Yeshiva University 1947 277 p. illus. 21 cm. $3 75 110

Contents: The meaning of mathematics. The bearings of mathematics. Mathematics as a culture clue. Scientists teach laymen. The nature of the doctrinal function and its role in rational thought. Mathematics and the science of semantics. A glance at some of *the ideas of Charles Sanders Peirce. William Benjamin Smith.* Mathematics and the dance of life. Three great *synonyms*: Relation—transformation—function. Vilfredo Federico Damaso Pareto: Mathematician—economist—sociologist. Panthetics.

Note. A series of essays dealing intimately and lucidly with the philosophical, historical, biographical, didactic and disciplinary aspects of mathematics. The writings were assembled by the author's friends both as a tribute to him and in order to make them available for the use and enjoyment of larger groups of readers.

KEYSER, CASSIUS JACKSON

Mathematics and the question of cosmic mind with other essays. New York Published by Scripta Mathematica, Yeshiva College, 1935 121 p. illus. 19 cm. (The Scripta Mathematica library No. 2) $1.25 111

Contents: The meaning of mathematics. The bearings of mathematics. Mathematics and the question of the cosmic mind. Mitigating the tragedy of our modern culture. On the study of legal science. William Benjamin Smith. Index.

Note: A series of six essays reprinted with alterations from *The American scholar, Scripta mathematica,* and the *Yale law journal.* The first three essays constitute a logical sequence and should be read in order. Logical acumen, rather than mathematical knowledge or aptitude, is required for their understanding.

KLINE, MORRIS

Mathematics in western culture. New York Oxford University Press, 1953 484 p. illus. 23 cm. $7.50 112

Contents (abridged) Introduction. True and false conceptions. The birth of the mathematical spirit. Placing a yardstick to the stars. Renewal of the mathematical spirit. Science born of art—projective geometry. The deduction of universal laws. Grasping the fleeting instant—the calculus. The Newtonian influence—science and philosophy—religion—literature and aesthetics. Mastery of the ether waves. The science of human nature. Prediction and probability. Our disorderly universe—the statistical view of nature. The theory of relativity. Selected references. Index.

Note: An interpretation of mathematics as one of the primary elements in the culture of the Western World. As shown by the chapter titles, the organization is primarily chronological in accordance with the development of mathematics, and the book can be read as an informal history of the chief landmarks in mathematical thought. However, the primary thesis is the influence of this thought on not only religion, philosophy, art, etc., but on the whole culture. The author's views are interesting, and his style is not difficult to read. The book is for educated laymen, students of the history of civilization, and mathematicians who are interested in the general implications of their science.

KOKOMOOR, FRANKLIN WESLEY

Mathematics in human affairs. New York Prentice-Hall, Inc., 1942 754 p. illus. 23 cm. (Prentice-Hall mathematics series A. A. Bennett, editor) $6.25 113

Contents: The social function of mathematics. A world of approximations. Shape and size. Arithmetic comes of age. Widening the system and its symbolism. Equations on duty. Families of equations. Problems of dependence. Calculating the inaccessible. Interrelations of angles and sides. Steppingstones to calculations. Chains of related numbers. Pocketbook mathematics. Yardsticks of chance. Picturing functional relations. Rules and tools of geometry. Handling statistical data. Changeable rates of change. The notion of integration. The way ahead. Appendix (tables). *Glossary of symbols.* Index.

Note: This book is designed for the layman and beginning college student. The treatment combines discussions of the history and cultural aspects of mathematics with expositions of mathematical principles, study guides, and exercises for self-instruction.

KRAITCHIK, MAURICE

Mathematical recreations. Second revised edition. New York Dover Publications Inc. 1953 330 p. illus. 22 cm. $1 75 114

Contents: Preface. Mathematics without numbers. Ancient and curious problems. Numerical pastimes. Arithmetico-geometrical questions. The calendar. Probabilities. Magic squares. Geometric recreations. Permutational problems. The problem of the queens. The problem of the knight. Games. Index.

Note: This book brings together a great variety of the most famous and many of the least-known of mathematical games, riddles, and puzzles. It is based on a course of lectures given at the New School for Social Research, New York, in 1941, and may be regarded as a revised edition of the author's *La Mathématique des jeux*, Brussels, 1930. This edition is essentially a reprint of the original edition, New York, Norton, 1942.

KRAMER, EDNA ERNESTINE

The main *stream of mathematics.* New York Oxford University Press 1951 321 p. illus. 22 cm. $5.00 115

Contents: Mathematical giants. Nature, art, and geometry. The binding energy of thought. The mathematics of the forbidden. The human equation. Ascent without rockets. The father of modern mathematics and his legacy. Science and the scrapmaker. The dotted side. A world in flux. From Alice to Einstein. The realm of relativity. The paradise of mathematicians.

Note: The first several pages of this excellent book for lay readers are devoted to the Hindu legend about *Lilavati*, daughter of Bhaskara, whose name is attached to the Hindu mathematical work in which our number system is first clearly set forth. The last pages are devoted to Zeno's famous paradoxes on motion and the concept of infinity. In between, there is considerably more narrative than mathematical exposition; nevertheless, the development of mathematics is skillfully outlined, and many of its major concepts are made as clear as they can be made to the nonmathematical mind.

LIEBER, LILLIAN (ROSANOFF)

Infinity With drawings by Hugh Gray Lieber New York Rinehart & Company Inc., 1953 359 p. illus. 20 cm. $5.00. 116

Contents: Our good *friend* Σ.M. Infinity in the physical world—in mathematics. More about "potential" infinity. Non-Euclidean geometries. "Actual" infinity. A still greater "actual" infinity! The continuum of real numbers. How to go from $\aleph_0$ to c. Operations on transfinites. Higher dimensions. A hierarchy of infinities! A brief summary. Is it legitimate? Some very interesting infinite sets. Applications—Dane et al. The calculus of Newton and Leibniz. Areas. The fundamental theorem of the integral calculus.

Modern integration. Concluding chapter on modern integration. Paradoxes—in the theory of transfinites and how they have been conquered. The moral. Appendixes.

Note Although built around the idea of explaining the concept of infinity this book is essentially a popular exposition of segments of geometry number theory calculus, and modern techniques of integration. It is written in an informal style developed by the author and employed in several other popular books written by her. In the volume the text is set in short lines of varying length to facilitate reading by phrases. Illustrations include not only conventional geometric figures but also cartoon-type drawings.

LIEBER, LILLIAN (ROSANOFF)

Take a number, mathematics for the two billion Drawings by Hugh Gray Lieber New York The Ronald Press Company, 1946 221 p illus. 21 cm $3 25 117

Co tent (abridged) The equipment. The rules of the game Addition. Subtraction. Rapid progress. Multiplication and division with letters. Zero. Some practical problems. Algebra and geometry help each other) Formulas. Answers.

Note In this primer of mathematics the authors have again employed the original techniques of their other popular expositions. The diction is simple and lively and reading of the text has been facilitated by breaking it up into short lines of varying length. The text is further enlivened by the cartoon-like drawings. The book is intended for self-instruction but some adults read it for entertainment.

LOGSDON, MAYME (IRWIN)

A mathematician explains Decorative drawings by Chichi Lasley Second edition Chicago The University of Chicago Press, 1936 189 p illus 23 cm $3 00 118

Co tent (abridged) Chronological list of mathematicians. Nature of mathematics, arithmetic, algebra, geometry and trigonometry Analytical geometry The differential calculus. The integral calculus Mathematical interpretations of geometrical and physical phenomena, by G. A. Bliss. Mathematics and life.

Note Tells informally hat a student or average educated person should know about mathematics its development to meet human need from primitiv to modern times what it is what it does and how Stresses the relation f mathematics to the physical sciences, its meanings and the uses f deductiv logic in everyday life A "new plan text of the U iversity of Chicago.

MAZIARZ, EDWARD A

The philosophy of mathematics New York Philosophical Library 1950 286 p 21 cm. $4 00 119

Contents Introduction The problem f the philosophy of mathematics. Part 1, The history of the philosophy of mathematics The historical relation between mathematics and philosophy Ancient conceptions. The Cartesian era. British empiricism. Idealism and positivism. Contemporary directions. Part II, The philosophy of mathematics The distinction of speculativ sciences The nature of mathematical abstraction Mathematical abstraction and contemporary mathematics. Conclusion. Bibliography Index.

Not A critical study of the origins and purposes of mathematical thinking in relation to man other activities In the first part, which occupies about half f the volume the views of great mathematicians and philosophers on the subject are digested and discussed. In the second part th uthor attempts philosophy f mathematics f his own The book is of interest chiefly to students of the philosophy of mathematics and the philosophy f science in general It as prepared originally as doctoral thesis, and it is liberally equipped ith literature citations and supplementary notes.

MEYERS, LESTER

High speed math New York D Van Nostrand Company Inc 1947 554 p illus 21 cm $6 95 120

Content There is short-cut for irtually every multiplica ion problem. The break-down method of multiplication The double-and-halve method of multiplication More tricks in mental arithmetic. More short-cuts in multiplication Aliquot parts. Percentages and discounts. Preparing and checking bills. Dealing with parts of the gross, the ton and the yard. Checking results in multiplication Simple interest. Avoiding errors in addition. Avoiding errors in subtraction. Division can be as simple as multiplication. The "double-and-double method of division. Short-cutting the short-cuts or how to save pencil-and-paper work even with short-cuts. Slide rules and calculating machines they are ingenious and necessary devices, but why be slav to them? Averages and proportions. Profit ratios. Partial payments and interest on unpaid balances. Compound interest and annuities. Stocks and bonds. Decimals and fractions. Glossary

Note This book deals chiefly with short-cuts that may be employed to increase the range of computations that can be made without benefit of pencil and paper (or machines) and to shorten the paper work in problems too complicated to do mentally It contains also much material on methods of checking computations for errors. As books on rapid methods go, it is good one with unusually full treatments of calculations in such fields as annuities, interest, partial payments, and profit ratios.

MILLER, GEORGE ABRAM

The collected works of George Abram Miller Urbana University of Illinois, 1935–55 4 v 28 cm. $7 50 per vol. 121

Note Collected in these volumes are selected writings of George Abram Miller (1863–1951) an eminent mathematician who was for many years associated with the Department of Mathematics f the University of Illinois. The articles originally appeared in professional journals published in the United States of America and in other countries of the world. A majority of the papers pertain to the theory of finit groups and represent a definite contribution to the mathematical knowledge of this field. Papers on some other topics are included, also, for example, "The function of mathematics in scientific research. References to the original publications are given in all cases. The most recent paper included in the fourth volume was published in 1929 More volumes are scheduled for publication.

NEWMAN, JAMES R , compiler

The world of mathematics A small library of the literature of mathematics from A'h-mosé the scribe to Albert Einstein, presented with commentaries and notes by James R. Newman New York Simon and Schuster 1956 4 v illus 22 cm. $20 00 122

Contents (abridged) Volume I, Part General survey Part II Historical and biographical. Part III Arithmetic, numbers and the art f counting. Part IV Mathematics f space and motion. Volume II, Part Mathematics and the physical world. Part VI Mathematics and social science. Part VII The laws of chance. Volume III, Part VIII Statistics and the design of experiments. Part IX The supreme art f abstraction—group theory Part Mathematics of infinity Part XI Mathematical truth and the structure f mathematics. Part XII The mathematical way of thinking Part XIII Mathematics and logic. Part XIV The unreasonableness of mathematics. Part XV How to solve it. Part XVI The vocabulary f mathematics. Part XVII Mathematics as an art. Volume IV Part XVIII The mathematician. Part XIX Mathematical machines—can machine think? Part XX Mathematics in warfare. Part XXI A mathematical theory of art. Part XXII Mathematics of the good. Part XXIII, Mathematics in literature. Part XXIV Mathematics and music. Part XXV Mathematics as a culture clue. Part XXVI Amusements, puzzles, fancies. Index.

Note A well-selected general anthology of mathematical writing. It is addressed to general readers rather than to specialists. Consequently there is a predominance of narrative writing about mathematical topics and mathematicians, and relatively few mathematical papers written by mathematicians for mathematicians. Even so most of the selections have been taken from the works of eminent mathematicians Included are short commentaries written by the editor on the lif and work of the mathematicians represented in the collection. Because it conveys fair idea of the richness and range of mathematics viewed as a segment of human culture the collection is of interest to mathematicians and other scientists, as well as t laymen

NORTHROP EUGENE PURDY

Riddles in mathematics a book of paradoxes Princeton D Van Nostrand Company Inc. 1944 262 p illus 22 cm $4 50 123

Contents: What is a paradox? A few simple brain-teasers. The mighty midget 2 and other miracles (paradoxes in arithmetic). Now you see it—now you don't (paradoxes in geometry). Thou shalt not divide by zero (algebraic fallacies). Seeing is believing—perhaps (geometric fallacies). Outward bound (paradoxes of the infinite). What are the chances? (paradoxes in probability). Vicious circles (paradoxes in logic). Not for the novice (paradoxes in higher mathematics). Appendix.

Note: This popular treatment of various mathematical paradoxes has been designed for instruction as well as entertainment. The explanations of the reasons for the apparent inconsistencies give the reader a broader understanding of the fundamentals of mathematics and the logic of mathematical reasoning. At the same time, many of the important methods in elementary mathematics are shown in new and refreshing perspective.

OGILVY C. STANLEY

Through the mathescope. New York Oxford University Press 1956 162 p. illus. 21 cm. $4.00 124

Contents: What do mathematicians do? Number theory: Advanced arithmetic. Algebra. What are the chances? Algebraic oddities. Geometry. Geometry plane and fancy. Cones and conic sections. Wheels within wheels. Analysis: What's going on here? All shapes and sizes. Pi and pi-makers. Topology and typology. Notes. Index.

Note: The essential nature of mathematics, and particularly of some of its subdivisions, such as algebra and analysis, are explained in a light and entertaining style in this book for general readers. Its flavor is conveyed by the following passage: "It turns out, after a couple of millennia of unsatisfactory attempts, that the point is best left undefined. It is something like trying to define the number 1. Everybody knows what 1 means. To define anything so basic is not only unnecessary but probably impossible." Though light reading, the nature of the book is such that it will lead many readers to more advanced reading in mathematics.

POLYA, G

Induction and analogy in mathematics. Volume I of *Mathematics and plausible reasoning* Princeton Princeton University Press, 1954 280 p. illus. 24 cm. $5.50 125

Contents: Induction. Generalization, specialization, analogy. Induction in solid geometry. Induction in the theory of numbers. Miscellaneous examples of induction. A more general statement. Mathematical induction. Maxima and minima. Physical mathematics. The isoperimetric problem. Further kinds of plausible reasons. Final remark. Solutions to problems. Bibliography

—— Patterns of plausible inference. Volume II of *Mathematics and plausible reasoning* Princeton Princeton University Press, 1954 190 p illus. 24 cm. $4.50 the set, $9.00. 126

Contents: Some conspicuous patterns. Further patterns and first links. Chance, the ever-present rival conjecture. The calculus of probability and the logic of plausible reasoning. Plausible reasoning in invention and instruction. Solutions to problems. Bibliography

Note: The key to this work can be found in the author's phrase, "... certainly let us learn proving, but also let us learn guessing." The topic is plausible reasoning or, in other words, disciplined guessing with a purpose. The author defines terms, shows how the processes of plausible reasoning have been used by some of the great mathematicians and presents numerous criteria for the testing of conjectures. The writing is in the spirit of his well-known *How to solve it*, and this work might be viewed as a continuation of that one.

REID CONSTANCE

From zero to infinity what makes numbers interesting. New York Thomas Y Crowell Company 1955 145 p. illus. 21 cm. $3.00. 127

Contents: Zero. One. Two. Three. Four. Five. Six. Seven. Eight. Nine.

Note: In this book the history and special features of each of the ten numbers are interestingly presented for the general reader. Exercises and puzzles based on numbers are included.

RIDER, PAUL REECE

First year mathematics for colleges New York The Macmillan Company 1949 714 p. illus. 22 cm. $5.25 128

Contents: Review of elementary algebra. Factoring. Fractions. Rectangular coordinates. Functions and graphs. Linear equations. Exponents and radicals. Quadratic equations. Inequalities. Systems of equations involving quadratics. Proportion and variation. Mathematical induction and the binomial formula. Progressions. Approximate numbers and computation. Logarithms. Logarithmic and exponential curves. Power functions and their graphs. Mathematics of investment. Trigonometric functions of acute angles. Solution of right triangles. Logarithmic solution of right triangles. Trigonometric functions of any angle. Solution of oblique triangles. Trigonometric formulas and identities. Radian and mil. Trigonometric curves. Inverse trigonometric functions and curves. Trigonometric equations. Complex numbers. Polynomials. Theory of equations. Equation and locus. Straight line. Circle. Parabola, ellipse, hyperbola. Curve sketching. Parametric equations. Polar coordinates. Curve fitting. Permutations and combinations. Probability. Determinants. Partial fractions. Infinite series. Rectangular coordinates and directions in space. Plane and line. Surfaces and curves. Tables. Index. Answers to odd-numbered exercises.

Note: The wide scope of this book is obvious from the chapter titles. The author has designed it for use by both liberal arts and engineering students. An exceptionally full index makes the book useful for occasional reference and personal and public library collections. The author is Professor of Mathematics in Washington University

SANFORD VERA

A short history of mathematics. Under the editorship of John Wesley Young with an introduction by David Eugene Smith. Boston Houghton Mifflin Company 1930. 402 p illus. 20 cm. $5.25 129

Contents: Men who made mathematics. Arithmetic. Commercial mathematics. Algebra. Verbal problems. Practical geometry. Demonstrative geometry. Trigonometry. Analytic geometry. Calculus. Theory of numbers. Calculating devices. Weights and measures. The place of mathematics in the school curriculum. General histories of mathematics. Chronological outline. Index.

Note: A brief history for teachers, advanced students, and others familiar with the subject matter of mathematics. It outlines in chronological order the development of mathematics from Babylonian and Egyptian times to the beginning of the 19th century. Important theories are presented in simplified form, and their evolution from prior investigations is studied. Summaries follow each chapter and there are numerous illustrations from contemporary drawings and title pages. The bibliography is slight.

SCRIPTA MATHEMATICA FORUM LECTURES

addresses by Cassius Jackson Keyser David Eugene Smith Edward Kasner and Walter Rautenstrauch. New York Yeshiva College 1937 94 p. illus. 19 cm. (The Scripta Mathematica library No. 3) $1.25 130

Contents: Mind, the maker by Cassius Jackson Keyser. The story of mathematics, by David Eugene Smith. New names in mathematics, by Edward Kasner. Science in relation to social growth and economic development, by Walter Rautenstrauch.

Note: Addresses delivered at the meeting of the Forum of the Friends of *Scripta Mathematica* at Teachers College, Columbia University December 10, 1934. The first address, "Mind, the maker" represents an outline of a quite original and luminous theory of reality and the world, which was developed by William Benjamin Smith in his essay *Recent physics and world theory*. It was read at the Forum by Cassius Jackson Keyser. The second essay deals with the history of mathematics, the third with the use of new terms in mathematics, and the fourth with the relationships between science and social growth and economic development.

SIMONS, LAO GENEVRA

Fabre and mathematics, and other essays New York Scripta Mathematica, Yeshiva College, 1939 101 p 20 cm (The Scripta Mathematica library No 4) $1 25 131

Contents Fabre and mathematics. The interest f Alexander von Humboldt in mathematics. The influence of French mathematicians at the end of the eighteenth century Short stories in colonial geometry

Note This collection f essays is partly biographical and partly historical. The biographical sketches relate to scientists outside the realm of mathematics, while the historical sketches deal with the early history of mathematics in the United States of America. The book is intended for teachers, scientists, and interested laymen.

STRUIK, DIRK J

A concise history of mathematics. Second revised edition. New York Dover Publications, Inc., 1948 299 p illus 19 cm. (The Dover series in mathematics & physics W Prager, consulting editor) $1 75 132

Contents The beginnings. The Ancient Orient. Greece. The Orient after the decline of Greek society The beginnings in Western Europe. The seventeenth century The eighteenth century The nineteenth century Index.

Note. This summary of the development of mathematics is not only brief but readable. The latter quality is achieved partly by minimizing technical details and stressing trends, schools, and persons. The exposition is addressed to persons with serious and fairly mature interests in the science hence, there are frequent references to other works in which fuller treatments of specific topics are available.

STUDIES IN MATHEMATICS AND MECHANICS

Presented to Richard von Mises by friends, colleagues, and pupils. New York Academic Press Inc, 1954 353 p illus 24 cm $9 00 133

Contents (abridged) Introduction, by P Frank. Algebra and number theory—geometry Analysis. Theoretical mechanics. Applied mechanics. Probability and statistics.

Note A memorial volume containing 42 papers on range of topics which reflect the wide range of scientific interest of the late Richard von Mises. Preceding the contributed papers in the book are short estimation f von Mises' ideas and work, a bibliography of his writings on science and philosophy and bibliography of his writing on Rainer Maria Rilke. The last reflects von Mises' interest in German literature and in the work of this poet in particular The contributed papers (none f which is related to German literature) are the work of outstanding scientists of the United States f America and Europe and generally speaking, they describe new studies and advances in theoretical and applied mathematics.

GENERAL TABLES

BECKER GEORGE F, AND C E VAN ORSTRAND

Hyperbolic functions Sixth reprint. Washington D C. Smithsonian Institution 1949 321 p 23 cm. (Smithsonian mathematical tables) $3 00 134

Contents Introduction Definitions and formulas. Geometrical illustrations. Methods of interpolation. Description of tables. Historical note. Table Five place values of log sinh *u*, log cosh *u*, log tanh and log coth *u*. Table II Five place values of sinh cosh tanh and *coth u*. Table III *Five place values of sin u*, cos log sin and log cos *u*, being expressed in radians and their angular equivalents. Table IV The ascending and descending exponential to seven significant figures with $\log_{10}e^{u}$ to seven places. Nine place values of the same with ten place *logarithms from* −1 to −100. Auxiliary table of multiples of $\log_{10}e$ *for interpolation* of $\log_{10}e^{u}$ Table VI Five place values of natural logarithms. Interpolation coefficients for derivative formula. Table VII: The gudermannian of *u* to seven places in radians and to the same order of accuracy in degrees, minutes, and seconds. Table VIII: The anti-gudermannian to hundredths of a minute in terms of the gudermannian expressed in degrees and minutes from 0°0' to 89°59' (This table is otherwise known as table of meridional parts for spherical globe.) Table VIII Table for conversion of radians into angular measure and vice versa. Numerical constants.

Note First published in 1909 this useful handbook has since been reprinted six times. In the course *of the* reprintings minor errors detected have been corrected. Also, in this sixth reprint notes were added on recently published tables, and bibliographies of mathematical tables.

BURINGTON, RICHARD STEVENS, compiler

Handbook of mathematical tables and formulas Third edition Sandusky, O Handbook Publishers, Inc, 1956 296 p illus 20 cm. $1 75 135

Contents (abridged) Part one, Formulas and theorems from elementary mathematics. Part two, Tables. Index.

Note. A comparatively small but useful compilation of formulas, theorems, and tables frequently used by scientists and other workers in such fields as applied mathematics, engineering, physics, chemistry and insurance, and by college students of science and engineering. It includes tables of logarithms, trigonometric functions, squares, cubes, square roots and cube roots, annuity tables, probability functions, factors for computing probable errors and many others. The number of tables in Part two is 38. The first edition was published in 1933 and the third edition in 1949 In preparing the third edition, rather extensive revision and some additions were made and the book was printed from re-set type. Corrected reprints were made in 1953 1954 1955 and 1956. The copy examined for the purpose of this note was of the 1956 printing.

DWIGHT, HERBERT BRISTOL

Tables of integrals and other mathematical data. Revised edition New York The Macmillan Company 1947 250 p illus. 21 cm. $3 00 136

Contents Algebraic functions. Trigonometric functions. Inverse trigonometric functions. Exponential functions. Probability integrals. Logarithmic functions. Hyperbolic functions. Inverse hyperbolic functions. Elliptic functions. Bessel functions. Surface zonal harmonics. Definite integrals. Differential equations. Tables of numerical values. References. Index.

Note The first edition of this work established it firmly as standard mathematical tool. I this edition, number of new tables and data have been added. These include material on Bessel functions, inverse functions of complex quantities, probability integral table, and groups of integrals involving $(ax^2 + bx + \ )1/2$, $\frac{1}{+ b \sin}$ and $\frac{1}{+ b \cos}$ A third edition was published early in 1957

HODGMAN, CHARLES D, editor in-chief

C R. C. standard mathematical tables Tenth edition. Formerly *Mathematical tables from Handbook of chemistry and physics* Associate editor in charge of chemistry Robert C. Weast associate editor in charge of mathematics Samuel M Selby Cleveland Chemical Rubber Publishing Company, 1956 441 p 20 cm $3 00 137

Contents (abridged) Numerical constants Logarithms. Natural trigonometric functions. Natural or naperian logarithms. Exponential functions. Hyperbolic functions. Numerical tables. Probability of occurrence of deviations. Chi square table. Bessel functions *J* (*x*) and *J* (*x*). Laplace transforms. Algebra. Series. Mensuration formulae. Hyperbolic functions. Elliptic functions. Interest tables Moment of inertia for various bodies. Abbreviations and symbols of mathematics. Index.

Note As indicated in the title, this book was originally reprint of the section on mathematical tables of the widely used *Handbook of chemistry and physics*. However with the publication of the tenth edition, the contents were considerably expanded, and the status of the work changed to an independent one. Many of the tables are still

[illegible] with those in the present *Handbook*, but also there is substantial number which are not to be found there. Only [illegible] of the table of contents is quoted above. In the full contents there are approximately 140 tables, most of which represent mathematical tables. In comparison to the ninth edition of the separate published in 1948 under the title *Mathematical tables*, several tables have been revised, others have been extended and there is [illegible] number of new tables. The length of the volume has been increased by approximately 30 pages.

LARSEN HAROLD D., compiler

Rinehart mathematical tables formulas and curves. Enlarged edition. New York Rinehart and Company Inc., 1953 280 p. 21 cm. $2.50. 138

Contents (abridged) Part one Five-place common logarithms of numbers. Natural trigonometric functions. Common logarithms of trigonometric functions. Powers, roots, and reciprocals. Degrees, minutes, and seconds to radians. Natural values of the trigonometric functions for angles in radians. Radians to degrees, minutes and seconds. Common logarithms of the trigonometric functions for angles in radians. Common logarithms of factorials. Four place natural logarithms. Values and logarithms of exponential functions. Values of hyperbolic functions. American experience table of mortality. Commissioners 1941 standard ordinary mortality table. Amount of 1 at compound interest. Amount of 1 per annum at compound interest. Ordinates of the normal probability curve. Areas of the normal probability curve. [illegible] probability scale. Values of Bessel functions $J_0(x)$ and $J_1(x)$. Values of the complete elliptic integrals. Square root divisors. Part two Greek alphabet. Weights and measures. Miscellaneous physical constants. Important mathematical constants. Formulas from algebra. Formulas from geometry. Formulas from trigonometry. Hyperbolic functions. Curves for reference. Derivatives. Indefinite integrals. Definite integrals. Series. Index.

Note A well-selected compilation of tables and formulas for general use by college students and applied mathematicians. Particular attention has been given to layout and typography in the interest of legibility. The first edition was published in 1948. Seven tables, including the table of square root divisors, have been added in this edition.

SPENCELEY GEORGE WELLINGTON AND OTHERS

Smithsonian logarithmic tables to base e and base 10 Prepared by George Wellington Spenceley, Rheba Murray Spenceley and Eugene Rhodes Epperson. Washington, D C. The Smithsonian Institution, 1952 402 p. 24 cm. (Smithsonian miscellaneous collections. Vol 118 (whole volume) Publication 4054) $4.50 139

Contents Preface by G. W. and R. M. Spenceley. Introduction by E. R. Epperson. Logarithms of powers of 10. Table 1 Natural logarithms (to base e). Table 2 Common logarithms (to base 10).

Note These logarithmic tables represent an adaptation of [illegible] method of computing logarithms. A 20-place [illegible] table of natural logarithms was used by the compilers in the preparation of their [illegible] tables [illegible] and these tables are an outgrowth of the preparation of the earlier work. Table [illegible] presents 23-decimal-place values of the natural logarithms. Table 2 presents 23-decimal-place values of the common logarithms of XXXX, 1.0XXXX, and 1.0XXXXX, the range of XXXX being from 1 to 10,000. The computations of the tables was carried out at Miami University and funds for the publication were granted by the Research Corporation of New York.

UHLER, HORACE SCUDDER

A new table of reciprocals of factorials and some derived numbers. New Haven The Connecticut Academy of Arts and Sciences 1937 51 p 24 cm. (Connecticut Academy of Arts and Sciences. Transactions. Vol. 32 January 1937 p 381–434) $1.25 140

Note The main table consists of two parts, the first giving the reciprocals of factorials from 14 to 314 complete to 475 decimal places, and the second giving reciprocals of factorials from 315 to 399 to 70 significant figures following several hundred zeros after the decimal point. All of the values here given were computed in two different ways, one by long division by hand work, the other by means of an electrically driven, 10-place Monroe calculating machine and the results were then checked one against the other. There is [illegible] bibliography of 17 related tables referred to in the Introduction.

UNITED STATES. NATIONAL BUREAU OF STANDARDS

Table of natural logarithms for arguments between zero and five to sixteen decimal places. (A reissue of Mathematical table 10) Washington, D C. Government Printing Office, 1953 501 p. 27 cm. (United States. National Bureau of Standards Applied mathematics series no. 31) $4.75 141

Contents Introduction, by A. N. Lowan. Constants. Table of natural logarithms, [illegible] 16D.

Note This volume republishes a work which was originally published in 1941 as Volume 3 of [illegible] 4-volume work now out of print. The table is especially useful to engineers and other practical computers who have frequent use for natural logarithms and wish to obtain them quickly. The table is not intended to take the place of common logarithms as [illegible] multiplying and dividing tool, but rather to furnish values of natural logarithms where directly needed. There has been some rearrangement of the introductory material in the new edition, but the table is without change, no errors in it having been reported.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Table of sines and cosines to fifteen decimal places at hundredths of a degree. Issued May 2 1949 Washington, D C. Government Printing Office 1949 95 p. 26 cm. (United States. National Bureau of Standards. Applied mathematics series 5) $0.50 142

Contents Introduction. Table of sine and cosine [illegible] 15D. Supplementary table I, of sine and cosine [illegible] 30D. Reprinted from Hermann, "[illegible] der trigonometrischen Functionen von den Winkeln und der Winkel aus den Functionen, bis zu einer beliebigen Grenze der Genauigkeit. *Kaiserliche Akademie der Wissenschaften, Wien, Mathematisch-naturwissenschaftliche Classe, Sitzungsberichte* 1, pt. IV p. 164–180 (1848). Supplementary table II, table of $E(\theta)$ and $F(\theta)$ [illegible] 30D.

Note Trigonometric tables with decimal subdivision of the degree are of great convenience in numerous problems of applied mathematics. The present volume is to meet the need for such tables, provides tabulation of the sine and cosine to 15 decimal places at intervals of one-hundredth of a degree. The work was done with the financial support of the Office of Naval Research of the Navy Department.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Tables of 10^x (antilogarithms to the base 10) Washington, D C. Government Printing Office, 1953 543 p illus. 27 cm. (United States. National Bureau of Standards. Applied mathematics series no. 27) $3.50 143

Contents Introduction, by H. E. Salzer. Table I, prepared under the direction of M. Abramowitz. Table of 10^x [illegible] 10D. Table II, prepared under the direction of H. E. Salzer. Table of [illegible] 15D.

Note Computation of the first and larger table in this volume, the table of antilogarithms to the base 10, to 10 decimal places, was undertaken because of certain inadequacies in the table of antilogarithms in J. Dodson, London, 1742, which, although correct had become scarce, had not been superseded for over 200 years. The

SIMONS, LAO GENEVRA

Fabre and mathematics, and other essays New York Scripta Mathematica, Yeshiva College, 1939 101 p 20 cm (The Scripta Mathematica library No 4) $1 25 131

[illegible]

STRUIK, DIRK J

A concise history of mathematics Second revised edition New York Dover Publications, Inc , 1948 299 p illus 19 cm (The Dover series in mathematics & physics, W Prager, consulting editor) $1 75 132

Contents: The beginnings. The Ancient Orient. Greece. The Orient after the decline of Greek society. The beginnings in Western Europe. The seventeenth century. The eighteenth century. The nineteenth century. Index.

Note: This summary of the development of mathematics is not only brief but readable. [illegible] and trends [illegible] with persons and [illegible] in the [illegible] there are frequent references in which further treatments of specific topics are available.

STUDIES IN MATHEMATICS AND MECHANICS

Presented to Richard von Mises by friends, colleagues, and pupils New York: Academic Press, Inc , 1954 353 p illus 24 cm $9 00 133

Contents (abridged): Introduction, by P. Frank. Algebra and number theory. Geometry. Analysis. Theoretical mechanics. Applied mechanics. Probability and statistics.

Note: A memorial volume containing 41 papers on a range of topics which reflect the wide range of scientific interest of the late Richard von Mises. [illegible] the contributed papers, in the book are a brief estimation of von Mises' ideas and work, a bibliography of his writings on science and philosophy, and a bibliography of his writings on Rainer Maria Rilke. [illegible] interest in [illegible] and in the work of this poet in particular. The contributed papers, some of which are related to [illegible] material, are the work of outstanding scientists of the United States of America and Europe, and generally speaking, they describe new studies and advances in theoretical and applied mathematics.

GENERAL TABLES

BECKER, GEORGE F , AND C E VAN ORSTRAND

Hyperbolic functions Sixth reprint Washington, D C Smithsonian Institution 1949 321 p 24 cm (Smithsonian mathematical tables) $4 00 134

[illegible]

The [illegible] of π to seven places in radians and to the same order of accuracy in degrees, minutes, and seconds. Table VII. The anti-gudermannian to hundredths of a minute in terms of the gudermannian [illegible] expressed in degrees and minutes from 0°0' to 89°59'. (This table is otherwise known as a table of meridional parts for a spherical globe.) Table VIII. Table for conversion of radians into angular measure and vice versa. Numerical constants.

Note: First published in 1909, this useful handbook has since been reprinted several times. In the course of the reprintings errors [illegible] detected have been corrected. Also, in this sixth reprint notes were added on recently published tables, and bibliographies of mathematical tables.

BURINGTON, RICHARD STEVENS, compiler

Handbook of mathematical tables and formulas Third edition Sandusky, O Handbook Publishers, Inc , 1956 296 p illus. 20 cm $1 75 135

Contents (abridged): Part one, Formulas and theorems from elementary mathematics. Part two, Tables. Index.

Note: A comparatively small but useful compilation of formulas, theorems, and tables frequently used by scientists and other workers in such fields as applied mathematics, engineering, physics, chemistry, and [illegible], and by college students of science and engineering. It includes tables of logarithms, trigonometric functions, squares, cubes, square roots and cube roots, annuity tables, probability functions, factors for computing probable errors and many others. The number of tables in Part two is 38. The first edition was published in 1933 and the third edition in 1949. In preparing the third edition, [illegible] extensive revision and some additions were made and the book was printed from new type. Corrected reprints were made in 1951, 1954, 1955, and 1956. The copy examined for the purposes of this note was of the 1956 printing.

DWIGHT, HERBERT BRISTOL

Tables of integrals and other mathematical data Revised edition New York The Macmillan Company, 1947 250 p illus 21 cm $3 00 136

Contents: Algebraic functions. Trigonometric functions. Inverse trigonometric functions. Exponential functions. Probability integrals. Logarithmic functions. Hyperbolic functions. Inverse hyperbolic functions. Elliptic functions. Bessel functions. Surface zonal harmonics. Definite integrals. Differential equations. Tables of numerical values. References. Index.

Note: The first edition of this work established it firmly as [illegible] mathematical [illegible]. In this edition, a number of new tables and [illegible] have been added. These include material on Bessel functions, inverse functions of complex quantities, a probability integral table and groups of integrals involving $(ax^2 + bx + c)^{1/2}$, $\frac{1}{a + b \sin x}$ and $\frac{1}{a + b \cos x}$. A third edition was published early in 1957.

HODGMAN, CHARLES D , editor-in-chief

C. R. C. standard mathematical tables. Tenth edition Formerly *Mathematical tables from Handbook of chemistry and physics* Associate editor in charge of chemistry, Robert C. Weast, associate editor in charge of mathematics, Samuel M. Selby Cleveland Chemical Rubber Publishing Company 1956. 441 p. [illegible] cm $3 00 137

Contents (abridged): Numerical constants. Logarithms. Natural trigonometric functions. Natural logarithms. Exponential functions. Hyperbolic functions. Numerical tables. Probability functions. [illegible] Bessel functions [illegible] Laplace transforms. Algebra. Series. Moments of inertia [illegible] Interest tables. [illegible] mathematics. Index.

Note: As indicated by the title, this book was originally a reprint of the section on mathematical tables of the widely used *Handbook of chemistry and physics*. However, with the publication of the tenth edition, the contents were considerably expanded, and the status of [illegible] changed to an independent one. Many of the tables are still [illegible]

identical with those in the parent *Handbook*, but also there is a substantial number which are not to be found there. Only [illegible] of the table of contents is quoted above. In the full contents, there are approximately 140 titles, most of which represent mathematical tables. In comparison to the ninth edition of the separate published in 1948 under the title *Mathematical tables*, several tables have been revised, others have been extended and there is a fair number of new tables. The length of the volume has been increased by approximately 50 pages.

LARSEN HAROLD D., compiler

Rinehart mathematical tables, formulas and curves. Enlarged edition. New York Rinehart and Company Inc., 1953 280 p. 21 cm. $2.50 138

Contents (abridged). Part one: Five-place common logarithms of numbers. Natural trigonometric functions. Common logarithms of trigonometric functions. Powers, roots, and reciprocals. Degrees, minutes, and seconds to radians. Natural values of the trigonometric functions for angles in radians. Radians to degrees, minutes, and seconds. Common logarithms of the trigonometric functions for angles in radians. Common logarithms of factorials. Four-place natural logarithms. Values and logarithms of exponential functions. Values of hyperbolic functions. American experience table of mortality. Commissioners 1941 standard ordinary mortality table. Amount of 1 at compound interest. Amount of 1 per annum at compound interest. Ordinates of the normal probability curve. Areas of the normal probability curve. χ^2 probability scale. Values of Bessel functions $J_0(x)$ and $J_1(x)$. Values of the complete elliptic integrals. Square root division. Part two: Greek alphabet. Weights and measures. Miscellaneous physical constants. Important mathematical constants. Formulas from algebra. Formulas from geometry. Formulas from trigonometry. Hyperbolic functions. Curves for reference. Derivatives. Indefinite integrals. Definite integrals. Series. Index.

Note: A well-selected compilation of tables and formulas for general use by college students and applied mathematicians. Particular attention has been given to layout and typography in the interest of legibility. The first edition was published in 1948. Seven tables, including the table of square root division, have been added in this edition.

SPENCELEY GEORGE WELLINGTON AND OTHERS

Smithsonian logarithmic tables to base e and base 10. Prepared by George Wellington Spenceley, Rheba Murray Spenceley and Eugene Rhodes Epperson. Washington, D C The Smithsonian Institution 1952 402 p. 24 cm. (Smithsonian miscellaneous collections. Vol. 118 (whole volume) Publication 4054) $4.50 139

Contents: Preface, by G. W. and R. M. Spenceley. Introduction by E. R. Epperson. Logarithms of powers of 10. Table 1. Natural logarithms (to base e). Table 2. Common logarithms (to base 10).

Note: These logarithmic tables represent an adaptation of Hoüel's factorization method of computing logarithms. A 20-place Hoüel table of natural logarithms was used by the compilers in the preparation of their Smithsonian elliptic functions tables, 1947, and these tables are an outgrowth of the preparation of the earlier work. Table 1 presents 23-decimal-place values of the natural logarithms, Table 2 presents 23-decimal-place values of the common logarithms, of XXXX, 0XXXXX, and 1 0XXXXX, the range of XXXX being from 1 to 10 000. The compilation of the tables was carried out at Miami University and funds for the publication were granted by the Research Corporation of New York.

UHLER, HORACE SCUDDER

A new table of reciprocals of factorials and some derived numbers. New Haven The Connecticut Academy of Arts and Sciences, 1937 51 p. 24 cm. (Connecticut Academy of Arts and Sciences. Transactions. Vol. 32 January 1937 p. 381–434) $1.25 140

Note: The main table consists of two parts, the first giving the reciprocals of factorials from 14 to 314, complete to 411 decimal places, and the second giving reciprocals of factorials from 315 to 369 to 70 significant figures following several hundred zeros after the decimal point. All of the values here given were computed in two different ways, one by long division by hand work, the other by means of an electrically driven, 10-place Monroe calculating machine, and the results were then checked one against the other. There is a bibliography of 17 printed tables referred to in the Introduction.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Table of natural logarithms for arguments between zero and five to sixteen decimal places (A reissue of Mathematical table 10) Washington, D C. Government Printing Office, 1953 501 p. 27 cm. (United States National Bureau of Standards. Applied mathematics series no 31) $4 75 141

Contents: Introduction, by A. N. Lowan. Constants. Table of natural logarithms, x = 0(.0001)5 16D.

Note: This volume republishes a work which was originally published in 1941 as Volume 3 of a 4-volume work now out of print. The table is especially useful to engineers and other practical computers who have frequent use for natural logarithms and wish to obtain them quickly. The table is not intended to take the place of common logarithms as a multiplying and dividing tool, but rather to furnish values of natural logarithms where directly needed. There has been some rearrangement of the introductory material in the new edition, but the table is without change, no errors in it having been reported.

UNITED STATES. NATIONAL BUREAU OF STANDARDS

Table of sines and cosines to fifteen decimal places at hundredths of a degree. Issued May 2 1949 Washington, D C. Government Printing Office 1949 95 p. 26 cm. (United States. National Bureau of Standards Applied mathematics series 5) $0.50 142

Contents: Introduction. Table of sines and cosines x = [0°(0.01°)90°, 15D]. Supplementary table of sines and cosines x = [1°(1°)89°, 30D]. Reprinted from Herrmann, "Bestimmungen der trigonometrischen Funktionen aus den Winkeln und der Winkel aus den Funktionen, bis zu einer beliebigen Grenze der Genauigkeit," Kaiserliche Akademie der Wissenschaften, Wien. *Mathematisch-naturwissenschaftliche Classe. Sitzungsberichte* [illegible] (1848). Supplementary table II, table of $K(p)$ and $F(p)$, $p = D(.001)1$ 8D.

Note: Trigonometric tables with decimal subdivision of the degree are of great convenience in numerous problems of applied mathematics. The present volume, to meet the need for such tables, provides a tabulation of the sine and cosine to 15 decimal places at intervals of one-hundredth of a degree. The work was done with the financial support of the Office of Naval Research of the Navy Department.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Tables of 10^x (antilogarithms to the base 10) Washington, D C. Government Printing Office, 1953 543 p illus. 27 cm. (United States. National Bureau of Standards. Applied mathematics series no. 27) $3.50. 143

Contents: Introduction, by H. E. Salzer. Table I, prepared under the direction of M. Abramowitz, Table of 10^x, x = 0(.00001)1.00000, 10D. Table II, prepared under the direction of H. E. Salzer. Table of [illegible] (1)999; p = .1, .4 [illegible] .12,.13 15D.

Note: Compilation of the first and longer table in this volume, the table of antilogarithms to the base 10, to 10 decimal places, was undertaken because of certain inadequacies in the table of antilogarithms in J. Dodson, London, 1742, which, although copies had become scarce, had not been superseded for over 200 years. The

SIMONS, LAO GENEVRA

Fabre and mathematics and other essays New York Scripta Mathematica, Yeshiva College, 1939 101 p 20 cm. (The Scripta Mathematica library No 4) $1 25 131

Contents. Fabre and mathematics. The interest of Alexander von Humboldt in mathematics. The influence of French mathematicians at the end of the eighteenth century Short stories in colonial geometry

Note. This collection f essays is partly biographical and partly historical. The biographical sketches relat to scientists outside the realm f mathematics, while the historical sketches deal with the early history of mathematics in the U ited States of America. The book is intended for teachers, scientists, and interested laymen.

STRUIK, DIRK J

A concise history of mathematics Second revised edition New York Dover Publications, Inc 1948 299 p illus. 19 cm. (The Dover series in mathematics & physics W Prager, consulting editor) $1 75 132

Contents· The beginnings. The Ancient Orient. Greece. The Orient after the decline of Greek society The beginnings in Western Europe. The seventeenth century The eighteenth century The nineteenth century Index.

Note. This summary of the development of mathematics is not only brief but readable. The latter quality is achieved partly by minimizing technical details and stressing trends, schools, and persons. The exposition is addressed to persons with serious and fairly mature interests in the science hence there are frequent references to other works in which fuller treatments of specific topics are available.

STUDIES IN MATHEMATICS AND MECHANICS

Presented to Richard von Mises by friends, colleagues, and pupils. New York Academic Press, Inc., 1954 353 p illus 24 cm $9 00 133

Contents (abridged) Introduction, by P Frank. Algebra and number theory—geometry *Analysis. Theoretical mechanics. Applied* mechanics. Probability and statistics.

Note. A memorial volume containing 42 papers on a range of topics which reflect the wide range f scientific interest of the late Richard von Mises. Preceding the contributed papers in the book are short estimation f von Mises' ideas and work, bibliography f his writings on science and philosophy and bibliography of his writing on Rainer Maria Rilke. The last reflects von Mises' interest in German literature and in the work of this poet in particular The contributed papers (none f which is related to German literature) are the work of outstanding scientists of the United States f America and Europe and generally speaking, they describe new studies and advances in theoretical and applied mathematics.

GENERAL TABLES

BECKER, GEORGE F, AND C E VAN ORSTRAND

Hyperbolic functions. Sixth reprint. Washington D C Smithsonian Institution 1949 321 p 23 cm (Smithsonian mathematical tables) $3 00 134

Contents Introduction Definitions and formulas. Geometrical illustrations. Methods of interpolation. Description of tables. Historical note. Table Five place values of log sinh log cosh u, log tanh u, and log coth u. Table II Five place values of sinh u, cosh u, tanh and coth u. Table III Five place values of sin u, cos u, log sin and log cos being expressed in radians and their angular equivalents. Table IV· The ascending and descending exponential to seven significant figures with log₁₀e^u to seven places. Nine place values of the *same with ten* place logarithms from =1 to =100. Auxiliary table of multiples of log₁₀e for interpolation of log₁₀e^u Table V· Five place values of natural logarithms. Interpolation coefficients for derivative formula. Table VI The gudermannian of to seven places in radians and to the same order of accuracy in degrees, minutes, and seconds. Table VII. The anti-gudermannian to hundredths of minute in terms of the gudermannian expressed in degrees and minutes from 0°0′ to 89°59′ (This table is otherwise known as table of meridional parts for spherical globe.) Table VIII Table for conversion of radians into angular measure and vice versa. Numerical constants.

Note First published in 1909 this useful handbook has since been reprinted six times. In the course of the reprintings minor errors detected have been corrected. Also, in this sixth reprint notes were added on recently published tables, and bibliographies of mathematical tables.

BURINGTON, RICHARD STEVENS, compiler

Handbook of mathematical tables and formulas Third edition. Sandusky, O Hand book Publishers, Inc., 1956 296 p illus. 20 cm. $1 75 135

Contents (abridged): Part one, Formulas and theorems from elementary mathematics. Part two, Tables. Index.

Note A comparatively small but useful compilation of formulas, theorems, and tables frequently used by scientists and other workers in such fields as applied mathematics, engineering, physics, chemistry and insurance, and by college students of science and engineering. It includes tables of logarithms, trigonometric functions, squares, cubes, square roots and cube roots, annuity tables, probability functions, factors for computing probable errors and many others. The number of tables in Part two is 38. The first edition was published in 1933 and the third edition in 1949 In preparing the third edition, rather extensive revision and some additions were made and the book was printed from re-set type. Corrected reprints were made in 1953 1954 1955 and 1956. The copy examined for the purpose of this note was of the 1956 printing.

DWIGHT, HERBERT BRISTOL

Tables of integrals and other mathematical data. Revised edition. New York The Macmillan Company, 1947 250 p illus. 21 cm. $3 00 136

Contents Algebraic functions. Trigonometric functions. Inverse trigonometric functions. Exponential functions. Probability integrals. Logarithmic functions. Hyperbolic functions. Inverse hyperbolic functions. Elliptic functions. Bessel functions. Surface zonal harmonics. Definite integrals. Differential equations. Tables of numerical values. References. Index.

Note The first edition of this work established it firmly as standard mathematical tool. In this edition, number of new tables and data have been added. These include material on Bessel functions, inverse functions of complex quantities, probability integral table, and groups of integrals involving $(ax^2 + bx + \ )1/2$, $\frac{1}{\ + b\sin}$ and $\frac{1}{\ + b\cos}$ *A third edition was published early in 1957*

HODGMAN, CHARLES D, editor in-chief

C. R. C. standard mathematical tables Tenth edition Formerly *Mathematical tables from Handbook of chemistry and physics* Associate editor in charge of chemistry Robert C. Weast associate editor in charge of mathematics Samuel M Selby Cleveland Chemical Rubber Publishing Company 1956 441 p 20 cm $3 00 137

Contents (abridged) Numerical constants. Logarithms. Natural trigonometric functions. N tural or naperian logarithms. Exponential functions. Hyperbolic functions. Numerical tables. Probability of occurrence of deviations. Chi square table. Bessel functions J ( ) and J (x). Laplace transforms. Algebra. Series. Mensuration formulae Hyperbolic functions. *Elliptic functions.* Interest tables. Moment of inertia for various bodies Abbreviations and symbols of mathematics. Index.

Note As indicated in the title, this book was originally reprint of the section on mathematical tables of the widely used *Handbook of chemistry and physics.* However with the publication of the tenth edition, the contents were considerably expanded, and the status of the work changed to an independent one. Many of the tables are still

presentation. Highlights in the development of mathematics and exposition of principles and techniques are integrated throughout the work. Many problems for the student to solve are included.

HILL, M. A., JR. AND J BURTON LINKER

Introduction to college mathematics. Revised edition. New York Henry Holt and Company 1955 428 p. illus. 22 cm. $5.50 150

Contents: Part 1, Algebra and trigonometry: Introduction. Functions. Graphical representation of functions. Factoring and fractions. Exponents and radicals. Logarithms. Solution of right triangles by logarithms. Linear equations. Quadratic functions and equations. Equations of higher degree. Functions of multiple angles. Oblique triangles. Complex numbers. Permutations, combinations, and probability. Frequency distributions. Part 2, Elements of analytic geometry and calculus: The straight line. The circle. The conics. Polar and parametric forms. Differentiation. Integration. Answers to odd-numbered problems. Index.

Note. A well-organized introduction to the traditional contents of first-year mathematics courses. The first edition was published in 1951. In the revised edition, the topics treated in the original edition have been retained, and two chapters have been added on frequency distributions and permutations, combinations, and probability. The authors are members of the faculty of the University of North Carolina.

STABLER, E. R.

An introduction to mathematical thought. Reading Mass. Addison-Wesley Publishing Company Inc., 1953 268 p. illus. 21 cm. $6.00 151

Contents: Part 1, Mathematical thought in relation to logic and science: The nature of mathematical knowledge. The origin and influence of logical systems. Essentials of logical reasoning—fundamental concepts, implication, rules of inference—propositional functions, general propositions, classes. Scientific method and scientific knowledge. Part 2, Some significant postulational systems, concepts, and methods: Elementary algebra as a logical system. An abstract geometric system. Postulational concepts and methods—fields. Groups, rings, Boolean algebras. Relations, order systems, lattices. Survey of mathematical foundations. Bibliography. Index.

Note: An introduction to the foundations of mathematics, designed primarily for college use but written in a style that makes it readable also to mature general readers.

UNDERWOOD RALPH S AND FRED W SPARKS

Living mathematics. Second edition. New York McGraw Hill Book Company Inc., 1949 374 p. illus 23 cm. $5.50 152

Contents: Part 1, Algebra: The haphazard beginning. Onward to algebra. A sentence and what comes of it. Now we picture it. Putting exponents to work. A toy becomes a tool. Part 2, A look over the field. Measuring the inaccessible. New life in old figures. W[illegible] creep up on solutions. Variables caught in action. Our results grow prophetic. A ladder without a top. Fun with figures. Extended analytic geometry: a new field of mathematics. Appendix. Index. Answers.

Note: The first regularly published edition of this book bore the subtitle, A first year college course. In its second edition, the book is still designed primarily for use in college courses. However the authors have also aimed at the audience of amateur mathematicians. The contents of the book are the traditional algebra, trigonometry, calculus, and analytic geometry of first-year college texts. However, the expository text is written out with unusual fullness, thus making the book to home reading and self instruction. Furthermore, it is written in a light vein, and there is even an occasional anecdote. The chapter titled "Fun with figures" deals frankly with mathematical recreations. The first edition was published in 1940. The terminal chapter is new in this edition. Numerous revisions have been made in other chapters to improve them in one way or another. The style has been toned down somewhat and is less flippant. The authors are members of the faculty of Texas Technological College.

ALGEBRA

ALBERT ABRAHAM ADRIAN

Fundamental concepts of higher algebra. Chicago The University of Chicago Press 1956 165 p. 24 cm. (The University of Chicago Committee on Publications in the Physical Sciences A. Adrian Albert and others) $6.50 153

Contents: Groups, Rings and fields. Vector spaces and matrices. Theory of algebraic extensions. Finite fields. Appendixes. Index.

Note: A compact exposition "of the fundamental concepts of modern algebra which are needed for a clear understanding of the place of finite field theory in modern mathematics." It is designed for use in organized classes but is suitable also as a refresher or introduction for professional mathematicians. A new proof for the normal basis theorem for cyclic fields is included in one chapter and the final chapter on finite fields makes use of Galois theory and group theory. The bibliography contains 70 references "to other papers on equations in several variables over a finite field."

ALBERT, ABRAHAM ADRIAN

Introduction to algebraic theories. Chicago The University of Chicago Press, 1941 137 p. 23 cm. $3.00 154

Contents (abridged): Polynomials. Rectangular matrices and elementary transformations. Equivalence of matrices and of forms. Linear spaces. Polynomials with matric coefficients. Fundamental concepts.

Note: This book is a text for a course making the appropriate transition from the intuitive to the abstract. It can be used to give training in the theory of matrices to the beginner, but with modern algebraic proofs. Its only prerequisite material is a knowledge of that part of the theory of equations given as a chapter of ordinary texts in college algebra as well as a reasonably complete knowledge of the theory of determinants.

ALBERT ABRAHAM ADRIAN

Modern higher algebra. Chicago The University of Chicago Press, 1937 319 p. 25 cm. (The University of Chicago science series) $6.50 155

Contents (abridged): Groups and rings. Rings with a unity element. Matrices. Similarity of square matrices. Symmetric and skew matrices. Finite groups. Fields over $\mathfrak{J}$. The Galois theory. Cyclic fields. Algebra of matrices. Introduction to the transcendental theory of fields. V[illegible] functions. Glossary. Index.

Note: This is the first exposition of the theory of matrices over a general field. The modern viewpoint of automorphism groups is used to teach the Galois theory. The text is the first in English on algebra providing adequate foundation for the study of linear associative algebras and gives the only exposition in English of the theory of fields with valuation, and consequently of p-adic numbers. Proofs of the theorems are exceptionally short, and algebraic technique is emphasized throughout the text.

ALBERT ABRAHAM ADRIAN

Structure of algebras. New York American Mathematical Society 1939 210 p. 26 cm. (American Mathematical Society Colloquium publications. Vol. XXIV) $4.00 156

Contents: Fundamental concepts. Ideals and nilpotent algebras. The structure theorems of Wedderburn. Simple algebras. Crossed products and exponents. Cyclic semi-fields. Cyclic algebras and p-algebras. Representations and Riemann matrices. Rational division algebras. Involutions of algebras. Special results. Bibliography. Index.

Note: This volume is divided roughly into two parts, the first being concerned with the general theory of algebras, the second containing applications to related problems. In the general theory of algebras, there are two main topics of discussion, the first the reduction to simple algebras and the second the discussion of the simple algebras themselves. Among the applications of the theory of algebras treated are the theory of representations, the arithmetic-

second table is table in convenient format, permitting the user to obtain in few steps the antilogarithm of any 15-decimal number to about 15 decimals or about 13 significant figures. Preparation of the tables was sponsored by the Office of Naval Research of the Department of the Navy and by the Flight Research Laboratory of the United States Air Force.

FOUNDATIONS, MATHEMATICAL LOGIC

CHURCH, ALONZO

Introduction to mathematical logic. Volume I. Princeton Princeton University Press, 1956 376 p 24 cm (Princeton mathematical series, editors Marston Morse and A W Tucker) $7 50 144

Content Introduction The propositional calculus. Functional calculi of first order The pure functional calculus of first order Functional calculi of second order Index of definitions. Index of authors cited.

Note. A new graduate-level textbook to be complete in two volumes. Though not labeled as a second edition, it is based on the author's *Introduction to mathematical logic*, Part I Princeton, 1944 and in fact is described in the preface as a revised and much enlarged edition of that work. Volume one contains the chapters whose titles are given above. A tentative table of contents for volume two lists the following chapter titles "Functional calculi of higher order Second order arithmetic (The logistic system A²) Gödel's incompleteness theorems. Recursive arithmetic. An alternative formulation of the simple theory of types. Axiomatic set theory Mathematical intuitionism. When complete, the work will afford an introductory but very substantial exposition of mathematical logic. It *contains in addition to the expository matter* large *selection of* exercises ranging from elementary to difficult. The author is a member of the faculty of Princeton University and editor of the *Journal of symbolic logic*

ROSENBLOOM, PAUL C

The elements of mathematical logic. New York Dover Publications Inc., 1950 214 p illus 21 cm. $1 45 145

Contents The logic of classes. The logic of propositions. The logic of propositional functions. The general syntax of language. Appendixes. Bibliographical and other remarks. Index.

Note An introduction to the logic of mathematics, addressed to readers with considerable mathematical sophistication who have not previously studied mathematical logic. Boolean algebra is discussed in the first chapter and the methods of Russell, Quine, Zermelo, Curry and Church are discussed in the third chapter In the fourth chapter the methods of mathematical logic are applied to study of the general syntax of language, and the author concludes, As the matter stands today we must close this book sitting squarely and painfully on the horns of the dilemma the only known adequate languages are incomplete and not provably consistent by the modes of reasoning which they express, and the only ones (i.e. provably consistent) ones are inadequate. The bibliography is helpful feature, in that it combines citations of sources with the author' *comments* on their significance, historical and otherwise.

ROSSER, J BARKLEY

Logic for mathematicians New York Mc Graw Hill Book Company, Inc. 1953 530 p illus. 24 cm (International series in pure and applied mathematics William Ted Martin, consulting editor) $10 50 146

Contents What is symbolic logic? The statement calculus. The use of names. Axiomatic treatment of the statement calculus. Clarification. The restricted predicate calculus. Equality Descriptions. Class membership. Relations and functions. Cardinal numbers. Ordinal numbers. Counting. The axiom of choice. W rest our case. Bibliography Index.

Note In this work logic, particularly *symbolic logic, is presented* from the viewpoint of mathematicians who are interested in the applications of logic to mathematical reasoning. The author acknowledges his *indebtedness* to Whitehead and Russell's famous *Principia mathematica* and states that "by using techniques invented since its writing, we have succeeded in condensing most of *Principia mathematica*' three large volumes into the present text. The difficulties presented by Skolem's paradox and other paradoxes such as the Russell, Cantor and Burali-Forti are discussed at some length. In the final chapter, the author discusses in a helpful, critical manner a selection of texts in which the proofs have been *constructed on logical* principles, even though the books are not concerned with mathematical logic.

WILDER, RAYMOND L

Introduction to the foundations of mathematics. New York John Wiley & Sons Inc., 1952 385 p illus 24 cm $5 75 147

Content Part I, Fundamental concepts and methods of mathematics The axiomatic method. Analysis of the axiomatic method. Theory of sets. Infinite sets. Well-ordered *sets ordinal* numbers. The linear continuum and the real number system. Groups and their significance for the foundations. Part II, Development of various viewpoints on foundations The early developments. The Frege-Russell thesis—mathematics an extension of logic. Intuitionism. Formalism. The cultural setting of mathematics. Bibliography Index of symbols. Index of topics and technical terms. Index of names.

Note Essentially this is a book about the nature of modern mathematics. The first part is devoted to the fundamental methods, such as the axiomatic method, and to fundamental concepts, such as that of "set. The second part is study mainly philosophical, of the nature of this foundation material. Here, the more significant contributions to this aspect of mathematics are reviewed succinctly and critically The book is development of a course given by the author at the University of Michigan, and is designed primarily as text. Laymen who pursue the study of mathematics for its cultural value and others who are *interested in the meaning of science* to society will be interested in at least the final chapters.

GENERAL TEXTBOOKS

ALLENDOERFER, C B , AND C O OAKLEY

Principles of mathematics. New York Mc Graw Hill Book Company Inc., 1955 448 p. illus. 24 cm. $5 00 148

Contents Logic. The number system. Groups. Fields. Sets and Boolean algebra. Functions. Algebraic functions. Trigonometric functions. Exponential and logarithmic functions. Analytic geometry Limits. The calculus. Statistics and probability Answers to selected exercises. Index.

Note. The modern viewpoint of this introduction to mathematics for college students is its chief distinguishing feature. The range of topics is indicated by the chapter titles listed above. Throughout the book, but especially in the first four chapters, the emphasis is on fundamental principles and basic concepts of mathematics. The chapters on functions, analytic geometry calculus, etc., introduce the reader to the main ideas of these areas and to typical problems. Each chapter includes list of references to books in which more extended treatments are to be found, and also to pertinent articles in the *American mathematical monthly*

BOYER, LEE EMERSON

Mathematics, a historical development. New York Henry Holt and Company 1956 478 p illus 22 cm $5 25 149

Contents (abridged) Part I, Arithmetic The growth of number—its systematization. Fundamental operations. Fractions. Decimals. The influence of measuring upon the use of numbers. *The slide rule.* Denominate numbers. Arithmetic bibliography Part II, Algebra The nature and meaning of algebra. Exponents and radicals. Algebra as the language of science. Some characteristics *of* the language of science. Algebra in highly generalized and abstract form. Graphs and several special types of equations. Functions as equations. Algebra bibliography *Part III*, Geometry A historical approach to geometry Two kinds of geometry—informal and demonstrative. On *the educational value of* demonstrative plane geometry Geometry bibliography Part IV Trigonometry Historical introduction. Solution *of* triangles. Logarithms. Appendix. Answers to odd-numbered problems. Index

Note An exposition of fundamental mathematics for such college students as prospective teachers, who will require a general knowledge *of elementary mathematical* principles and perspective view of the significance of the science, but who will not use mathematics in

novelty is the organization of the material and the bringing together of five fundamental theorems in Chapter II and in giving the proofs of these as rapidly as possible for the beginning student. More than 750 exercises are included. This edition is a reprint of the original edition, Boston, Ginn and Company 1937.

CARTAN HENRI AND SAMUEL EILENBERG

Homological algebra. Princeton Princeton University Press 1956 390 p. 24 cm. (Princeton mathematical series. Editors Marston Morse and A. W Tucker) $7.50. 164

Contents Rings and modules. Additive functors. Satellites. Homology. Derived functors. Derived functors of ⊗ and Hom. Integral domains. Augmented rings. Associative algebras. Supplemented algebras. Products. Finite groups. Lie algebras. Extensions. Spectral sequences. Applications of spectral sequences. Hyperhomology. Appendix. Exact categories, by D. A. Buchsbaum. List of symbols. Index of terminology.

Note Though organized as a textbook and containing exercises for students, this book is also a contribution to pure algebra. The authors state, "During the last decade, the methods of algebraic topology have invaded extensively the domain of pure algebra, and initiated a number of internal revolutions. The purpose of this book is to present a unified account of these developments and to lay the foundations of a full-fledged theory. The invasion of algebra has occurred on three fronts through the construction of cohomology theories for groups, Lie algebras, and associative algebras. The three subjects have been given independent but parallel developments. We present herein a single cohomology (and also a homology) theory which embodies all three; each is obtained from it by a suitable specialization.

CHEVALLEY CLAUDE

The algebraic theory of spinors. New York Columbia University Press, 1954 131 p. 24 cm. $3 75 165

Contents Introduction. Preliminaries. Quadratic forms. The Clifford algebra. Forms of maximal index. The principle of triality. Acknowledgments. Index.

Note. In the introduction to this book, the author has stated that "the construction of the notion of spinors given by Cartan was rather complicated. . . . R. Brauer and H. Weyl gave a much simpler presentation of the theory based on the use of Clifford algebras. We follow their method in the present book, but we complete it by a simple construction of the pure spinors and of their relation with linear varieties on the cone Q = 0. In particular, we obtain a parametric representation of the pure spinors which is valid for all basic fields, while their characterization by the quadratic equations of Cartan breaks down for fields of characteristic 2." Basic material on quadratic forms is developed in the first chapter, thus making the book essentially self-contained. Selected geometric and algebraic applications of the theory of spinors are illustrated, but there are no applications to physical theory.

CHEVALLEY CLAUDE

Fundamental concepts of algebra. New York Academic Press, Inc., 1956 241 p. illus. 23 cm. (Pure and applied mathematics, a series of monographs and textbooks edited by Paul A. Smith and Samuel Eilenberg) $6.80. 166

Contents. Monoids. Groups. Rings and modules. Algebras. Associative algebras. Index.

Note A graduate-level text in selected topics of modern algebra, addressed to readers familiar with the concepts of set theory. It was developed in courses taught by the author at Columbia University. Considerable prominence is given to the theory of modules and to operations on it. On the latter point, the author states, "The operations from the general theory of modules which are considered here are essentially the construction of the group of linear mappings of a module into another one and the construction of the tensor product of two modules. These concepts are not . . . the only useful ones; but we believe that they encircle what everybody must know from the theory of modules." In the fourth and fifth chapters the student is introduced to the general concept of algebras and to the associative algebras. Taken together, these chapters account for 100 of the volume's pages. Throughout the book, the exposition is mathematically rigorous.

COWLES WILLIAM H. H. AND JAMES E. THOMPSON

Algebra for colleges and engineering schools. Second edition. Princeton D Van Nostrand Company Inc., 1947 275 p illus. 23 cm. $4.00. 167

Contents Algebraic laws and linear equations. Graphical methods and quadratic equations. Systems of quadratic equations. Complex numbers. Proportion, variation and functional relations. Sequences, progressions, and series. Binomial, exponential, and logarithmic series. Permutations, combinations, and probability. Theory of equations. Cubic, quartic, and higher equations. Partial fractions. Appendix. Index.

Note A successful textbook in which algebra is expounded for engineering college students. Although the level of treatment assumes completion of courses in secondary school algebra, elementary algebra is reviewed. A special feature is the early introduction of graphic methods. The exposition is written out fully and includes many worked examples, features which suit the book to use in self-instruction and home study. The first edition was published in 1931. In preparing this second edition, the authors reorganized the material of the first edition, revised the treatment of a number of topics, deleted the chapters on logarithms and the slide rule, and added the chapter on partial fractions.

JACOBSON, NATHAN

Lectures in abstract algebra. Princeton D Van Nostrand Company Inc., 1951–52 2 v 24 cm. (The university series in higher mathematics M H. Stone chairman) Vol. I $6.00 vol. II $6 75 168

Contents: Volume I, Basic concepts Introduction—Concepts from set theory, the system of natural numbers. Semi-groups and groups. Rings, integral domains and fields. Extensions of rings and fields. Elementary factorization theory. Groups with operators. Modules and ideals. Lattices. Index. Volume II, Linear algebra. Finite dimensional vector spaces. Linear transformations. The theory of a single linear transformation. Sets of linear transformations. Bilinear forms. Euclidean and unitary spaces. Products of vector spaces. The ring of linear transformations. Infinite dimensional vector spaces. Index.

Note: These are two volumes of a planned three-volume series on abstract algebra. As indicated in the title, the pattern of organization is that of lectures in a university course; the pattern is carried out with the inclusion of exercises for students. It is, of course, addressed to graduate students with considerable mathematical maturity and interest in abstract mathematics. The two volumes are essentially independent, although the treatment in Volume II assumes that the reader will have a knowledge of the basic concepts covered in Volume I. Generally speaking, the author has used an axiomatic approach; however, in the second volume he has included some calculational methods applicable to numerical problems, and has indicated occasional shortcuts in footnotes.

JACOBSON, NATHAN

Structure of rings. Providence American Mathematical Society 1956. 263 p. illus. 26 cm. (American Mathematical Society Colloquium publications. Vol. XXXVII) $7 70 169

Contents: The radical and semi-simplicity. Irreducible modules and primitive rings. Rings with minimum condition. Primitive rings having minimal one-sided ideals. Kronecker products. Completely reducible modules. Galois theory for the ring of linear transformations. Division rings. PI rings and prime ideals. Structure spaces. Applications. Bibliography. Index.

Note A mathematically rigorous account of the structure theory of rings without finiteness assumptions. The author, Professor of Mathematics at Yale University is a noted contributor to this field of mathematics. He has included the results of his own studies and also the studies of others working in the same area. References to original papers are appended to the individual chapters and are collected again in the bibliography at the end of the volume. This bibliography is comprehensive for papers appearing since 1942. For a listing of earlier publications, reference is made to the author's Theory of rings, New York, 1943, now out of print.

tion of the normal simple algebras over finite algebraic fields, cyclic systems, and the modern theory of Riemann matrices. This book is founded on the author's *Modern higher algebra*, described above.

ARTIN, EMIL, AND OTHERS

Rings with minimum condition by Emil Artin, Cecil J Nesbitt, Robert M Thrall Ann Arbor University of Michigan Press, 1944 123 p 23 cm. (University of Michigan Publications in mathematics No 1) $2 50 157

Content Rings and vector spaces. Minimum condition. Matrix representations. Semisimple rings. Simple rings. Kronecker products of spaces and rings. Splitting fields and crossed products. Nonsemisimple rings with minimum condition. Index.

Note This work is mainly study f simple rings and their representation theory It is partly based on material used for lectures at the University of Michigan and Indiana University and is designed primarily for readers who are unfamiliar with algebraic methods.

BEAUMONT, ROSS A., AND RICHARD W BALL

Introduction to modern algebra and matrix theory New York Rinehart & Company, Inc 1954 331 p 23 cm $6 00 158

Contents Matrices and determinants. Groups of transformations. Vector spaces. Groups. Properties of number systems. Polynomials and the algebraic theory of fields. Matrices with polynomial elements. Canonical forms for groups of matrix transformations. Index.

Note The authors of this book are members of the faculty of the University f Washington and the book is based in part on their teaching experience. It is intended as an introduction to modern algebra for advanced undergraduate students and first year graduate students who are interested in the subject from the standpoint f its applications in science and other fields. Although the concepts and methods f modern algebra are definitely emphasized, certain classical results are included as a background. Definitions are precise, and proofs are rigorous. Numerous exercises for the student are included.

BIRKOFF, GARRETT, AND SAUNDERS MAC LANE

A survey of modern algebra. Revised edition New York The Macmillan Company 1953 472 p 22 cm $6 50 159

Content The integers Rational numbers and fields. Polynomials Real umbers. Complex umbers. Group theory Vectors and vector spaces. The algebra f matrices. Linear groups. Determinants and canonical forms. Algebra f classes. Transfinite arithmetic. Rings and ideals. Algebraic umber fields. Galois theory Bibliography Index Index f special symbols.

Note A standard, introductory text for college students studying modern algebra at the senior and graduate levels. The treatment emphasizes basic concepts and is designed for both the mathematics major and the student concerned with the application f these concepts to such related fields as physics and statistics. In this edition, such new topics as equations of stable type dual spaces, and the projective group have been added. The umber of review exercises has been increased, and the bibliography has been brought up to date A shorter ersion entitled, *A brief survey f modern algebra*, 1953 276 p $4 75 is available from the same publisher

BOROFSKY, SAMUEL

Elementary theory of equations New York The Macmillan Company 1950 302 p 22 cm. $5 00 160

Contents The complex number system. Polynomials in one variable. Polynomials in the complex domain. Derivatives and multiple roots. Polynomials with real coefficients. Theorems of Budan and Sturm. Approximations to real roots. Cubic and quartic equations. Ruler and compass constructions. Algebraic umber fields. Symmetric polynomials. Determinants. Linear equations. Elimination. Appendixes. Numerical answers. Index.

Note An introductory work designed to be studied after the student has mastered elementary algebra. The notions of field and polynomial over a field are used throughout the exposition, and to simplify the grasp of these concepts, polynomials are defined as functions rather than as elements of rings. The author is member of the faculty of Brooklyn College.

BRINK, RAYMOND WOODWARD

College algebra. Second edition New York Appleton Century Crofts, Inc., 1951 495 p illus 22 cm. (The Appleton Century mathematics series Raymond W Brink, editor) $4 00 161

Contents (abridged) The fundamental operations. Factoring. Linear equations in one unknown. Functions and their graphs. Exponents and radicals. Quadratic equations. Variation, ratio and proportion. Progressions. Logarithms. The binomial theorem. Complex umbers. Theory f equations. Permutations and combinations. Determinants. Infinite series. The mathematics of investment. Curv fitting and least squares. Index.

Not A standard text designed to meet the needs of college students who have completed at least one course in algebra in secondary school. The first edition was published in 1933 This edition has been extensively revised, and new chapters have been added on real umbers and curve fitting. The uthor is Professor of Mathematics in the University of Minnesota.

BRITTON, JACK R., AND L CLIFTON SNIVELY

Algebra for college students Revised edition New York Rinehart & Company, Inc. 1954 537 p illus 22 cm. $4 50 162

Contents Fundamental ideas from arithmetic. Signed numbers. The language of algebra. Simple equations, formulas, and statement problems. Special products and factoring. Fractions. Graphical representation and functional notation Linear equations in more than one variable. Exponents and radicals. Operations with radicals. Quadratic equations in one unknown. Ratio, proportion, and variation. Approximat umbers. Logarithms. The binomial theorem and mathematical induction. Progressions. Complex numbers. Inequalities. Theory of equations. Systems involving quadratic equations. Determinants. Permutations, combinations, and probability Partial fractions. Tables. Answers to odd-numbered problems. Index.

Note A successful textbook the first edition of which was published in 1947 It is designed for students who did not master algebra in secondary school. The exposition begins with review of arithmetic, then proceeds to elementary algebra. Algebra is developed as logical and consistent body of mathematical knowledge. The first 12 chapters are devoted to topics customarily taught at the beginning and intermediat levels, and the remaining chapters deal with topics normally covered in college courses. The first edition was published in 1947 Without changing the general plan of the book, some reorganization and considerable revision was made for this second edition. Changes are made in both the expository text and in the exercises for students, and the chapter on partial fractions was added.

CARMICHAEL ROBERT DANIEL

Introduction to the theory of groups of finite order New York Dover Publications Inc. 1956 447 p 21 cm (Textbooks in mathematics edited by R. D Carmichael) $3 95 163

Content Introduction. Five fundamental theorems. Additional properties of groups in general. Abelian groups. Prime-power groups. Permutation groups. Defining relations for abstract groups. Groups of linear transformations. Galois fields. Groups f isomorphisms of Abelian groups or order p^m and type (1 1 1) Finit geometries. Collineation groups in the finite geometries. Algebras of doubly transitive groups of degree p^n and order p^n (p^n — 1) Tactical configurations. Index.

Note: An introduction to the subject for the serious student of advanced mathematics. The author establishes important connections of the theory f finite groups with other domains of mathematics, and brings the reader to the boundary of present knowledge with an outlook on the fields yet to be explored. The material is based largely on existing expositions f the theory, including the works by Burnside, Hilton, Miller Blichfeldt, and Dickson. The main

novelty in the organization of the material is the bringing together of five fundamental theorems in Chapter [illegible] and in giving the proofs of these as rapidly as possible for the beginning student. More than 750 exercises are included. This edition is [illegible] reprint of the original edition, Boston, Ginn and Company 1937

CARTAN HENRI, AND SAMUEL EILENBERG

Homological algebra. Princeton Princeton University Press 1956 390 p. 24 cm. (Princeton mathematical series. Editors Marston Morse and A. W Tucker) $7.50. 164

Contents: Rings and modules. Additive functors. Satellites. Homology. Derived functors. Derived functors of ⊗ and Hom. Integral domains. Augmented rings. Associative algebras. Supplemented algebras. Products. Finite groups. Lie algebras. Extensions. Spectral sequences. Applications of spectral sequences. Hyperhomology. Appendix: Exact categories, by D. A. Buchsbaum. List of symbols. Index of terminology

Note: Though organized as [illegible] textbook and containing exercises for students, this book is also [illegible] contribution to pure algebra. The authors state, "During the last decade, the methods of algebraic topology have invaded extensively the domain of pure algebra, and initiated [illegible] number of internal revolutions. The purpose of this book is to present [illegible] unified account of these developments and to lay the foundations of [illegible] full-fledged theory The invasion of algebra has occurred on three fronts through the construction of cohomology theories for groups, Lie algebras, and associative algebras. The three subjects have been given independent but parallel developments. W[illegible] present herein [illegible] single cohomology (and also [illegible] homology) theory [illegible]hich embodies all three; each is obtained from it by [illegible] suitable specialization.

CHEVALLEY CLAUDE

The algebraic theory of spinors. New York Columbia University Press 1954 131 p. 24 cm. $3 75 165

Contents: Introduction. Preliminaries. Quadratic forms. The Clifford algebra. Forms of maximal index. The principle of triality Acknowledgments. Index.

Note: In the introduction to this book, the author has [illegible] stated that "the construction of the notion of spinors given by Cartan was rather complicated. [illegible] R. Brauer and H. Weyl gave much simpler presentations of the theory based on the use of Clifford algebras. W[illegible] follow their method in the present book, but we complete it by [illegible] simple construction of the pure spinors and of their relation with linear varieties on the cone $Q = 0$. In particular we obtain [illegible] parametric representation of the pure spinors which is valid for all basic fields. [illegible] like their characterization by the quadratic equations of Cartan breaks down for fields of characteristic 2. Basic material on quadratic forms is developed in the first chapter, thus making the book essentially self-contained. Selected geometric and algebraic applications of the theory of spinors are illustrated, but there are no applications to physical theory

CHEVALLEY CLAUDE

Fundamental *concepts* of algebra. New York Academic Press, Inc., 1956 241 p. illus. 23 cm. (Pure and applied mathematics, a series of monographs and textbooks edited by Paul A. Smith and Samuel Eilenberg) $6.50. 166

Contents: Monoids. Groups. Rings and modules. Algebras. Associative algebras. Index.

Note: A graduate-level text in selected topics of modern algebra, addressed to readers familiar with the concepts of set theory It was developed in [illegible] course taught by the author at Columbia University Considerable prominence is given to the theory of modules and to operations on it. On the latter point, the author states, "The operations from the general theory of modules which are considered here are essentially the construction of the group of linear mappings of [illegible] module into another one and the construction of the tensor product of two modules. These concepts are not [illegible] the only useful ones, but we believe that they contain what everybody would know from the theory of modules. In the fourth and fifth chapters the student is introduced to the general concept of algebras and to the associative algebras. Taken together, these chapters account for 100 of the volume's pages. Throughout the book, the exposition is mathematically rigorous.

COWLES WILLIAM H. H. AND JAMES E. THOMPSON

Algebra for colleges and engineering schools. Second edition. Princeton D Van Nostrand Company Inc., 1947 275 p. illus 23 cm. $4.00 167

Contents: Algebraic laws and linear equations. Graphical methods and quadratic equations. Systems of quadratic equations. Complex numbers. Proportion, variation and functional relations. Sequences, progressions, and series. Binomial, exponential, and logarithmic series. Permutations, combinations, and probability. Theory of equations. Cubic, quartic, and higher equations. Partial fractions. Appendix. Index.

Note: A successful textbook in [illegible]hich algebra is expounded for engineering college students. Although the level of treatment assumes completion of courses in secondary school algebra, elementary algebra is reviewed. A special feature is the early introduction of graphic methods. The exposition is written out fully and includes many worked examples, features which suit the book to use in self-instruction and home study The first edition was published in 1939. In preparing this second edition, the authors reorganized the material of the first edition, revised the treatment of [illegible] number of topics, deleted the chapters on logarithms and the slide rule, and added the chapter on partial fractions.

JACOBSON, NATHAN

Lectures in abstract algebra. Princeton D Van Nostrand Company, Inc., 1951–52 2 v 24 cm. (The university series in higher mathematics M H. Stone chairman) Vol. I $6 00 vol. II, $6 75 168

Contents: Volume I, Basic concepts Introduction—Concepts from set theory the system of natural [illegible] numbers. Semi-groups and groups. Rings, integral domains and fields. Extensions of rings and fields. Elementary factorization theory Groups with operators. Modules and ideals. Lattices. Index. Volume II, Linear algebra: Finite dimensional vector spaces. Linear transformations. The theory of [illegible] single linear transformation. Sets of linear transformations. Bilinear forms. Euclidean and unitary spaces. Products of vector spaces. The ring of linear transformations. Infinite dimensional vector spaces. Index.

Note: These are two volumes of [illegible] planned three-volume series on abstract algebra. As indicated in the title, the pattern of organization is that of lectures in [illegible] university course the pattern is carried out with the inclusion of exercises for students. It is, of course, addressed to graduate students with considerable mathematical maturity and interest in abstract mathematics. The two volumes are essentially independent, although the treatment in *Volume II assumes that the reader will have* [illegible] knowledge of the basic concepts covered in Volume I. Generally speaking, the author has used an axiomatic approach however in the second volume he has included some calculational methods applicable to numerical problems, and has indicated occasional shortcuts in footnotes.

JACOBSON NATHAN

Structure of rings. Providence American Mathematical Society 1956 263 p. illus. 26 cm. (American Mathematical Society Colloquium publications. Vol. XXXVII) $7 70 169

Contents: The radical and semi-simplicity Irreducible modules and primitive rings. Rings with minimum condition. Primitive rings having minimal one-sided ideals. Kronecker *products*. Completely reducible modules. Galois theory for the ring of linear transformations. Division rings. Nil ideals and prime ideals. Structure spaces. Applications. Bibliography Index.

Note: A mathematically rigorous account of the structure theory of rings without finiteness assumptions. The author Professor of Mathematics at Yale University is [illegible] noted contributor to this field of mathematics. He has included the results of his own studies and also the studies of others working in the same area. References to original papers are appended to the individual chapters and are collected again in the bibliography at the end of the volume. This bibliography is comprehensive for papers appearing since 1943. For [illegible] listing of earlier publications, reference is made to the author's *Theory of rings*, New York, 1943, now out of print.

KAPLANSKY, IRVING

Infinite Abelian groups Ann Arbor University of Michigan Press, 1954 91 p 23 cm $2 00 170

Contents Introduction. Examples of Abelian groups. Torsion groups. Zorn's lemma. Divisible groups. Three test problems. Pure subgroups. Groups of bounded order. Height. Direct sums of cyclic groups. Ulm's theorem. Modules and linear *transformations. Banach* spaces. Valuation rings. Torsion-free modules. Complete modules. The algebraic structure of compact Abelian groups. Characteristic submodules. The ring of endomorphisms. Guide to the literature. Bibliography Index.

Note: Based on course of lectures which the author gave at the University of Chicago in 1950, this book is both an introductory exposition of the theory of infinite groups for the restricted class of Abelian groups and a summary of the state of the theory and especially l the results pertaining to it published in the last two decades. Expository matter is somewhat less formal and more detailed than it might be in book designed for professional mathematicians alone on the other hand, the treatment is fully rigorous. The expository text is supplemented by a seven-page "Guide to the literature, in which the author comments historically and critically on the chief publications, and by a conventional bibliography of books and papers.

KELLER, MARION WILES

College algebra. Boston Houghton Mifflin Company, 1946 471 p illus. 22 cm $4 00 171

Contents *Review of fundamental operations.* Linear equations. Type products—factoring—equations. Fractions and fractional equations. Exponents and radicals. Quadratic equations. Systems of equations involving quadratics. Ratio—proportion—variation. Progressions. *Mathematical induction and the binomial theorem.* Logarithms. Complex numbers. Theory of equations. Inequalities. Determinants. Elements of the mathematics of finance. Permutations and combinations. Probability and insurance. Partial fractions. Infinite series. Tables. Answers to odd-numbered problems. Index.

Note. A well-organized introductory textbook. The presentation of elementary topics in the early chapters is sufficiently advanced over high-school algebra to benefit even those students who have had one or more courses in secondary school. Problems have been designed not only to provide drill but to illustrate variations in theory Also, a considerable number of the problems illustrate applications of algebra in various sciences and engineering. The publisher has provided an attractive format.

LEVI, HOWARD

Elements of algebra. Second edition New York Chelsea Publishing Company, 1956 160 p 21 cm $3.25 172

Contents *Sets, statements, and variables.* Cardinal numbers. Expressions. Polynomials. Number systems in general. Construction of the integers. Properties of the integers. The rational number system. Equations. Order The real number system. Appendix. Index.

Note An unconventional *introductory text* developed in course given by the author for number of years in the School of General Studies of Columbia University Although no previous training in algebra is presupposed, the topics taken up and the manner of treating them require concentration and mature attitude on the part of the student or reader The formal construction of the natural number system is carried out, and the associated algebra is developed. Although the treatment is mathematically rigorous, certain proofs are postponed to the appendix. The book is suitable not only for enrolled students but also for serious readers he pursue mathematics outside of organized courses It contains no whimsey or mathematical recreation rather its appeal is that of a challenge.

LOVITT, WILLIAM VERNON

Elementary theory of equations. New York Prentice-Hall, Inc. 1939 237 p illus 23 cm. (Prentice-Hall mathematical series Albert A Bennett editor) $4 50 173

Contents *Introduction.* Simultaneous linear equations in two and three variables. Solution of binomial equations. Properties of polynomials. Elementary theorems on the roots of an equation. Transformation of equations. Cubic and *quartic equations.* Bounds for the roots of an equation. Separation of the roots. Solution of numerical equations. Determinants. Symmetric functions of the roots. Resultants, discriminants, eliminants. Ruler and compass constructions. Answers. Index.

Note. Although the theory of equations is usually presented in a form suitable mainly for graduat and advanced undergraduate students, the present text makes the subject available to those who have completed a one-semester course in analytic geometry and have not had calculus. The material deals with algebraic equations and with sets of linear equations, plus a few simple transcendental equations to show the generality and power of Newton's method of solution. Simultaneous algebraic equations of degree higher than the first are not considered. Simple methods are given for isolating the real roots of an equation as preparatory step in determining their values by methods of approximation Graeff 's method of determining all real and complex roots without preliminary determination of their approximate values is included for the first time in a text of this kind.

McCOY, NEAL HENRY

Rings and ideals LaSalle, Ill Open Court Publishing Company, *1948* 216 p 18 7 cm. (The Carus mathematical monographs Number eight) $3 00 174

Contents. Definitions and fundamental properties. Polynomial rings. Ideals and homomorphisms. Some imbedding theorems. Prime ideals in commutative rings. Direct and subdirect sums. Boolean rings and some generalizations. Rings of matrices. Further theory of ideals in commutative rings. Bibliography Index.

Note. A treatise on abstract algebra which introduces the fundamental theory of *rings* and the *role* of ideals in the theory A knowledge of advanced college algebra should enable the reader to follow the text without difficulty In addition to the bibliography at the end of the volume, reference lists are provided with each chapter

MACDUFFEE, CYRUS COLTON

An introduction to abstract algebra. New York John Wiley and Sons Inc., 1940 303 p 23 cm $5 50 175

Contents The theory of numbers. Finite groups. Algebraic fields. Integral algebraic domains. Rings and fields. Perfect fields. Matrices. Linear associative algebras. Index. Symbols.

Note This textbook *for graduate students presupposes* course in theory of equations. The abstract point of few is developed gradually with discussions of special cases, and concrete instances of abstract ideas when they are presented. The author endeavors to give to the student a selected body of facts from number theory group theory etc., which will serve as background for understanding and appreciating the generalized results.

MACDUFFEE, CYRUS COLTON

Vectors and matrices La Salle Ill , Open Court Publishing Company 1943 192 p illus. *19 cm* (The Carus *mathematical monographs* No 7) $3 00 176

Contents Systems of linear equations. Vector spaces. Determinants. Matric polynomials. *Union and* intersection. Rational canonical form. Elementary divisors. Orthogonal transformations. Endomorphisms. Bibliography Index.

Note. A presentation of the technique in matric theory which has been *developed* during the *present* century by writers on the rational reduction of matrix. Intended primarily for teachers and students specializing in mathematics. There is brief bibliography

MESERVE, BRUCE E

Fundamental concepts of algebra. Reading *Mass Addison-Wesley* Publishing Company Inc. 1953 294 p illus 22 cm (Addison Wesley mathematics series Eric Reissner consulting *editor) $7 50* 177

Contents Our number system. Theory of numbers. Theory of polynomials. Theory of equations. Determinants and matrices. Constructions. Graphical representations. Bibliography Symbols and notations. Index.

Note: This book is an introductory exposition of selection of basic concepts in algebra and analysis. It explains such fundamental

such as "set," "space," "field," and "Euclidean complex space." These concepts are not only defined carefully but are illustrated by examples. The level of treatment is that of senior undergraduate or first-year graduate college courses. In addition to its use as a text in organized courses, the book is suitable as a self-instruction aid for readers who have achieved a moderate degree of mathematical maturity.

MIDDLEMISS, ROSS RAYMOND

College algebra. New York McGraw Hill Book Company Inc., 1952 344 p. illus. 24 cm. $4.00. 178

Contents: Real numbers. Fundamental operations. Operations with polynomials and rational fractional expressions. Equations. Functions and graphs. Systems of equations. Inequalities. Negative and fractional exponents. The exponential function. Logarithms. Variation. Progressions. Mathematical induction. The binomial theorem. Compound interest and annuities. Theory of equations. Determinants. Complex numbers. Permutations and combinations. Probability. Tables. Answers. Index.

Note: A modern introductory text intended for both science majors and liberal arts students. Considerable emphasis is placed on precision in stating hypotheses. The author is Professor of Mathematics in Washington University.

MILLER, EARLE BRENNEMAN AND ROBERT M THRALL

College algebra. New York The Ronald Press Company 1950 493 p. illus. 21 cm. $4 75 179

Contents (abridged): Part I. Introductory topics: The number system of algebra. Review topics. Part II, Functions of real variables, solution of equations. Linear functions and equations. Quadratic functions and equations. Functions and equations of the third and fourth degrees. Functions and equations of the nth degree. Rational functions. Exponential functions and logarithms. Part III, Functions of integers: Sequences and series. Arithmetic, harmonic, and geometric progressions. Mathematical induction. The binomial theorem. Part IV Other topics: Permutations and combinations. Probability. Matrices, determinants, and systems of linear equations. Complex numbers. Appendix. Index.

Note: A college textbook of intermediate level. It is designed for students who have had a course of elementary algebra and are planning to major in mathematics or in some branch of science where algebra is used at more than an elementary level. The first-named author is Professor of Mathematics in the Illinois College, and the second-named author is Associate Professor of Mathematics in the University of Michigan.

MURNAGHAN FRANCIS DOMINIC

The theory of group representations. Baltimore The Johns Hopkins Press, 1938 369 p. 23 cm. $5.00. 180

Contents: Groups and matrices. Reducibility. Group characters. The symmetric group. The characters of the symmetric group. The alternating group. Linear groups. Group integration. The orthogonal group. Spin representations of the rotation group. The crystallographic groups. The Lorentz group.

Note: This book gives an elementary and self-contained account of the theory of group representations with special attention to those groups, particularly the symmetric group and the rotation group, which have turned out to be of fundamental significance for nuclear physics. The theory of group integration is presented in a simple manner. Among the topics treated in detail are the analysis of the direct product of irreducible representations of the symmetric group, the Clebsch-Gordan series, the theory of two-valued or spin representations, the representations of the crystallographic groups and the analysis of their symmetrized Kronecker squares, the representations of the Lorentz group, and the theory of semi-vectors.

PERLIS SAM

Theory of matrices. Reading, Mass. Addison-Wesley Publishing Company Inc., 1952 237 p. 23 cm. (Addison-Wesley mathematics series Eric Reissner consulting editor) $6.50. 181

Contents: Introductory concepts. Vector spaces. Equivalence, rank, and inverses. Determinants. Congruence and Hermitian congruence. Polynomials over a field. Matrices with polynomial elements. Similarity. Characteristic roots. Linear transformations. References. Index.

Note: An introductory textbook written particularly for students of engineering and other fields who are mainly interested in matrix theory for its potential practical applications. However, as the author points out, it is suitable also for mathematics majors who are taking their first course in the subject. Basic ideas and techniques are emphasized, and each point and manipulation is carefully and fully discussed when first introduced. The author is Associate Professor of Mathematics in Purdue University.

PETERSON THURMAN S

Intermediate algebra for college students. Revised edition. New York Harper & Brothers, 1954 369 p. illus. 21 cm. (Harper's mathematics series Charles A. Hutchinson, editor) $3 75 182

Contents: Introduction. Signed numbers—addition and subtraction. Multiplication and division. Equations and stated problems. Factoring. Fractions. Equations of the first degree in two unknowns. Exponents, roots, and radicals. Graphical methods. Quadratic equations. Systems involving quadratic equations. Ratio, variation, and binomial theorem. Logarithms. Progressions. Answers. Index.

Note: A textbook specifically designed for the instruction of college students who have had no course or not more than a one-year course of algebra in secondary school. In its previous edition, it was entitled *Elements of algebra*, and it is still suitable for use as an introductory text. The ground covered is apparent from the chapter titles. Among the special pedagogical features are a high number of worked examples included in the expository text, a large number of exercises for the student to solve, and typography that calls special attention to important rules and formulas.

REAGAN LEWIS M AND OTHERS

College algebra. Revised edition. By Lewis M Reagan Ellis R. Ott, Daniel T Sigley New York Rinehart & Company Inc. 1948 447 p. illus. 21 cm. $4.50 183

Contents: Introduction—Fundamental operations. Functions and graphical representation. Fractions and linear equations. Applied problems. Ratio, proportion, and variation. Exponents and radicals. Logarithmic computation. Logarithmic and exponential equations. Complex numbers. Factors of polynomials. Quadratic equations. Theory of equations. Systems of equations of higher degree. Sequences and series. Interest and annuities. Choice. Probability. Topics in statistics. Determinants. Partial fractions. Inequalities. Selected topics. Fundamental topics and proofs. Tables. Index.

Note: A textbook for introductory college courses offered to students who have had one or more years of algebra in secondary school. The emphasis is on the mathematics without question. However applications are illustrated in the problems and in sections included for science and engineering students. The first edition was published in 1940. The chapter entitled "Topics in statistics" is new in this second edition. Exercises for students remain a special feature, and they have been revised and increased in number.

REES PAUL K., AND FRED W SPARKS

College algebra. Third edition. New York McGraw Hill Book Company Inc., 1954 460 p. 23 cm. $4.50. 184

Contents: The four fundamental operations. Special products and factoring. Fractions. Linear and fractional equations. Functions and graphs. Simultaneous linear equations. Exponents and radicals. Quadratic equations. Simultaneous quadratic equations. Ratio, proportion, and variation. Complex numbers. Higher-degree equations. Inequalities. Logarithms. The progressions. Mathematical induction. The binomial theorem. Compound interest and annuities. Permutations and combinations. Probability. Determinants. Partial fractions. Appendix. Answers. Index.

Note: A standard text book used in introductory courses in algebra at the college level. The treatment assumes that the student will have had a course in algebra in high school or preparatory school. However the basic concepts and operations of elementary algebra are reviewed in the first chapter. The style of the book is informal and readable, and the authors have made special efforts to aid the

beginning student in comprehension. The expository matter includes large number of worked examples. The second edition was published in 1945 The book was rather extensively rewritten for this third edition.

RICHARDSON, MOSES

College algebra. New York Prentice-Hall Inc., 1947 472 p illus 24 cm (Prentice Hall mathematics series, Albert A Bennett, editor) $5 75 185

Contents Preface for the student. The number system of algebra. What is algebra? Algebraic expressions. Functions and graphs. Elementary operations with polynomials. Factoring of polynomials. Elementary operations with fractional expressions. Linear equations and linear functions. Integral and fractional exponents. Radicals. Quadratic equations and quadratic functions. Systems of equations in t unknowns involving quadratics. Ratio, proportion, and variation. Complex numbers. Theory of equations. Determinants and elimination theory Permutations and combinations. Probability Mathematical induction. The binomial theorem. Progressions. Inequalities. Logarithms. Mathematics of investment. The Euclidean algorithm. Partial fractions. Infinite series. Interpolation and curve fitting. Answers to odd-numbered exercises. Tables. Index.

Note Topics usually covered in a first-year college algebra course are presented in this text. The introductory chapters provide a review f high-school algebra, but presented at a level consistent with the attainments of college students. Fundamental concepts are explained in detail. The treatment is such that various indicated hapters may be omitted to fit in with the requirements of shorter courses. Review exercises are interspersed at appropriat points throughout the textual material.

RIDER, PAUL R

College algebra. Revised edition. New York The Macmillan Company, 1955 397 p illus 21 cm $4 25 186

Contents Review f elementary algebra. Linear equations. Factoring. Fractions. Exponents and radicals. Quadratic equations. Systems of equations involving quadratics. Inequalities. Variation. Mathematical induction and the binomial formula. Progressions. Complex numbers. Theory f equations. Logarithms. Compound interest and annuities. Permutations and combinations. Probability Determinants. Partial fractions Infinite series. Tables. Index. Answers to odd-numbered exercises.

Note A standard textbook used in introductory college courses in algebra. A review of elementary algebra is contained in the first chapter Succeeding chapters deal with more advanced topics, as their titles show This edition differs from the preceding one published in 1947 chiefly in the first chapter which has been rewritten to improv it for students whose knowledge of elementary algebra is meager and in the exercises, all of which are new

RIETZ, HENRY L, AND ARTHUR R CRATHORNE

College algebra. Fifth edition. Revised by J William Peters New York Henry Holt and Company 1951 387 p illus. 21 cm $4.25 187

Content The umber system. Polynomials. Rational fractions Functions and their graphs. Equations and their solutions Systems of linear equations. Exponents and radicals Logarithms Quadratic equations. Systems of equations involving quadratics. Inequalities Mathematical induction and the binomial theorem. Complex numbers. Theory f equations. Ratio, proportion and variation. Progressions. Interest and annuities. Permutations and combinations Relative frequency and probability Determinants. Partial fractions. Limits. Infinite series. Series of positive terms. Series with both positive and negative terms. Tables. Answers Index.

Not A textbook widely used in the United States of America in introductory courses in colleges and technical institutes. In this first revision since 1939 the general objectives remain unaltered from the earlier editions However more extended review of the topics of secondary-school algebra is given, and there have been other modifications, including changes in most of the exercises and problems.

STOLL, ROBERT R

Linear algebra and matrix theory New York McGraw Hill Book Company, Inc. 1952 272 p 23 cm. (International series in pure and applied mathematics William Ted Martin, consulting editor) $6 00 188

Content Systems of linear equations. Vector spaces. Basic operations for matrices. Determinants. Bilinear and quadratic functions and forms. Linear transformations on a vector space. Canonical representations of a linear transformation. Unitary and euclidean vector spaces. References. Index of special symbols. Index.

Note In this book, matrix theory is presented against back ground of modern algebra. The first five chapters are devoted to topics in the basic theory of algebra and matrices. The comprehensive treatment f vector spaces in the second chapter is noteworthy In the fifth chapter bilinear and quadratic functions and forms are studied as representations of functions on a linear vector space. The two chapters on linear transformations are related to the preceding material on vector spaces and also to matrices, and the relatively long terminal chapter is devoted to unitary and Euclidean vector spaces, including transformations of vector spaces to normal forms. The author is Professor of Mathematics at Oberlin College, and the book is designed for use in courses offered to advanced undergraduate and first-year graduate students who are preparing for careers in mathematics or engineering

TARSKI, ALFRED

A decision method for elementary algebra and geometry Prepared for publication with the assistance of J C. C. McKinsey Second edition revised. Berkeley University of California Press, 1951 63 p illus 28 cm $2 75 189

Contents. Introduction. The system of elementary algebra. Decision method for elementary algebra. Extensions to related systems. Notes. Bibliography Supplementary notes.

Note In this monograph, a decision method is presented for elementary algebra which is comparable to the decision methods available for certain other areas of mathematics. The author described it as follows "The first, essential part consists in procedure by means of which, given any formula φ one can always find in mechanical way an equivalent formula which involves no quantifiers, and no free variables besides those already occurring in φ in particular this procedure enables us, given any sentence t find an equivalent sentence ithout quantifiers. The second part consists in procedure by means of which, given any sentence φ without quantifiers, one can always decide in mechanical way whether φ is true. It is obvious that these t o procedures together provide the desired decision method. The first edition was published by the Rand Corporation. This second edition, which is the first one to be made generally available is photographic reprint of the first, except for corrections of errors and the addition of supplementary notes and new references to the literature.

THEORY OF NUMBERS

DANTZIG, TOBIAS

Number the language of science. A critical survey written for the cultured non-mathematician Fourth edition revised and augmented. New York The Macmillan Company, 1954 340 p. illus 21 cm $5 00 190

Contents. Part I, Evolution of the umber concept Fingerprints. The empty column. Number-lore. The last umber Symbols. The unutterable. This flowing world. The act f becoming. Filling the gaps. The domain of umber The anatomy of the infinite. The two realities—milestones in the evolution of the number concept. Part II, Problems old and new On the recording of umbers. Topics in integers. On roots and radicals. On principles and arguments. Index of names. Index of subjects.

Note. First published in 1930, this book has long been recognized as successful account for mature general readers of the science of numbers, in which the emphasis is on symbol, form,

and the ideas which underlie them. The third edition was published in 1939. In this fourth edition, the first part—which runs to 179 pages—is essentially unchanged. The second part, which is 80 pages long, is new. It is more technical than the first part, and it affords the reader a view of some of the more advanced ideas in the theory of numbers, particularly methods and arguments.

DICKSON, LEONARD EUGENE

Modern elementary theory of numbers. Chicago The University of Chicago Press, 1939 309 p. illus. 20 cm. o.p. 191

Contents: Foundations of the theory of numbers. Theory of congruences. Quadratic residues and reciprocity law. Binary quadratic forms. Positive ternary quadratic forms. Universal theorems involving cubes. Sums of nine values of a cubic function. Indefinite ternary quadratic forms and universal and zero forms. Representation, quadratic, diophantine equations. Generalizations of Cauchy's lemma. Sums of values of a quadratic or quartic function. Conditions for solution of $F = O$ where F is an indefinite quadratic form in four or more variables. Waring's problem. Positive quadratic forms in variables. Appendix. Individuals of primes in an arithmetical progression. Appendix. Individuals of primes in an arithmetical progression. Index.

Note: An approach to the first principles of number theory, giving an elementary account of the essentials of the classic theory and of interesting topics of modern number theory. It provides brief course for beginners and supplementary course. Various new results are demonstrated.

DUBISCH ROY

The nature of number an approach to basic ideas of modern mathematics. New York The Ronald Press Company 1952 159 p. illus. 22 cm. $4.00. 192

Contents: Counting from one to a googol. Writing numbers from one to a googol. God made the integers. Creation completed. Zero again—and last. Fractions are easy now. The unspeakable. The great I solves all. A shot in the arm for complacent algebraists of the nineteenth century. How lasting was the shot? Last-minute edition of the *Algebra gazette*. The author's lament. Appendix. Suggestions for further reading. Answers to problems. Index.

Note: A refreshing exposition of the nature or ideas of present-day mathematics. The author begins it by showing that the mathematics of common knowledge, particularly arithmetic, is based on the acceptance of abstractions. After this he takes up the basic concepts of mathematics, such as matrix algebra and function theory. The book is written for laymen, and it should be useful to anyone who desires to learn what professional mathematicians concern themselves with.

GRIFFIN HARRIET

Elementary theory of numbers. New York McGraw Hill Book Company Inc., 1954 203 p. 24 cm. (International series in pure and applied mathematics William Ted Martin, consulting editor) $5.00 193

Contents: The fundamental laws. The linear diophantine equation. Properties of integers. Properties of congruences. The solution of congruences. The theorems of Fermat and Wilson and the Möbius function. On belonging to an exponent. Indices. Quadratic residues. Some famous problems. Polynomials. Partitions. Bibliography. Index.

Note: An introduction to the theory of numbers, written for the instruction of undergraduate college students who have knowledge of algebra. It is characterized by a careful selection of topics, by detailed proofs, and selected references to papers, journals, and passages in books in which specific topics are treated at greater length, or in which significant advances in the theory of numbers were first published. The author is a member of the faculty of Brooklyn College.

HANCOCK HARRIS

Foundations of the theory of algebraic numbers. New York The Macmillan Company 1931 2 v illus. 20 cm. $12.00 per vol. 194

Contents (abridged): Volume 1, Introduction to the general theory: The general notion of realms of rationality. Algebraic integers. The moduls of Dedekind. Divisibility. Generalized notions of division. Finite moduls. Algebraic moduls. The modular systems of Kronecker. The quadratic law of reciprocity. Application of the theory of ideals of quadratic realms to a discussion of Fermat's theorem. Geometric presentation of ideals. The cubic realms. Index. Volume II, The general theory: Theory of ideals. The Kronecker theory of forms. The divisors of the discriminant. Algebraic units. Extracts from Minkowski's *Geometry of numbers*. The number of ideal. Composite forms. Relative realms. Sub-realms. Super-realms. The Galois theory. Relations of a realm to its divisors. Development of algebraic numbers in series. Index.

Note: The purpose of this treatise for advanced students of mathematics is to offer an approach to a higher and more generalized arithmetic through a systematic study of the algebraic numbers. An attempt is made to show how the field of rational numbers is broadened by the introduction of the algebraic numbers and how thereby the realm of rationality is extended. The work follows the method of the Dedekind theory and compares that treatment with the fundamental forms and equations of Kronecker, the discriminant and order-moduli being taken as common ground.

JONES BURTON WADSWORTH

The arithmetic theory of quadratic forms. New York The Mathematical Association of America. Distributed by John Wiley & Sons Inc., 1950 212 p 19 cm. (The Carus mathematical monographs. No 10) $3.00 195

Contents: Forms with real coefficients. Forms with *P*-adic coefficients. Forms with rational coefficients. Forms with coefficients in $R(p)$. Genera and semi-equivalence. Representations by forms. Binary forms. Ternary quadratic forms. Bibliography. Problems. Theorem index. Index.

Note: A self-contained presentation of this mathematical topic. The author has assumed that his readers will be familiar with matrix theory and the theory of numbers. The work is of interest to graduate students specializing in mathematics, and to professional mathematicians. It used as introduction to this special subject. The author is a member of the faculty of the University of Colorado.

JONES BURTON WADSWORTH

The theory of numbers. New York Rinehart & Company Inc., 1955 143 p illus. 22 cm. $3 75 196

Contents: The development of the number system. Repeating decimals and congruences. Diophantine equations. Continued fractions. Nonlinear congruences. Quadratic residues. Bibliography. Index.

Note: This book is an introduction to the theory of numbers written at the level of undergraduate college students. It is designed to teach not only the elements of the theory of numbers but also how to think as a mathematician. The author has included features that adapt the book to the instruction of students preparing to teach mathematics in secondary schools and also those preparing for advanced work in mathematics. The pace of the exposition is leisurely and many exercises to be worked by the reader are included. These features, together with the many unexpected facts about the properties of numbers, give the book considerable appeal for amateur mathematicians, especially those who delight in mathematical recreations.

LARSEN HAROLD DANIEL

Arithmetic for colleges. New York The Macmillan Company 1950 275 p. illus. 21 cm. $4.35 197

Contents: Number. Casting out nines and elevens. Addition. Subtraction. Multiplication. Division. Common fractions. Decimal fractions. Percentage. Units of measure and dimensional relations. Approximate numbers and computation. Square root. Introduction to the slide rule. References. Appendix. Index. Answers.

Note: An unusual treatment of arithmetic because it is designed primarily for college students. Rather than a review of principles and techniques usually studied in elementary school, it is a fresh treatment suitable for persons who will teach arithmetic in elementary schools and for others who desire a treatment for mature readers. The bibliography is selective but includes outstanding "popular" treatments of mathematics, books on mathematical recreation, standard treatises on such topics as numbers, and books and articles on the teaching of arithmetic.

LeVeque, William Judson

Topics in number theory Reading, Mass Addison Wesley Publishing Company, Inc., 1956 2 v 22 cm. (Addison Wesley mathematics series Eric Reissner, consulting editor) Vol. I, $5 50 vol. II, $6 50 198

Contents Volume I Introduction The euclidean algorithm and its consequences. Congruences. Primitive roots and indices. Quadratic residues. Number-theoretic functions and the distribution of primes. Sums of squares. Pell's equation and some applications. Rational approximations to real numbers. Supplementary reading. List of symbols. Index. Volume II Binary quadratic forms. Algebraic numbers. Applications to rational number theory The Thue-Siegel-Roth theorem. Irrationality and transcendence. Dirichlet's theorem. The prime number theorem. Supplementary reading. List of symbols. Index.

Note Volume one of this work is elementary and is designed primarily for the instruction of advanced undergraduate and first year graduate college students. It introduces the reader to those topics in number theory named in the chapter titles. There are several features of pedagogic interest, such as a purposeful selection of proofs to instruct rather than to exhibit the elegance of number theory Volume two is somewhat independent of Volume one and covers more advanced topics. The treatment assumes considerable mathematical maturity on the part of the student and knowledge of the theory of symmetric polynomials, as well as the rule for multiplying determinants. " It contains some material of potential interest to graduate mathematicians with interests in number theory

Mueller, Francis J

Arithmetic its structure and concepts Englewood Cliffs, N J Prentice Hall, Inc. 1956 279 p 24 cm $6 00 199

Contents Number Synthesis. Analysis. Comparison. Fractions. Approximate numbers. Answers to problems. Index.

Note Written by the chairman of the Department of Mathematics of Maryland State Teachers College, this book will probably be used chiefly as a text for students preparing for careers as mathematics teachers. However its approach to arithmetic and its full discussions of basic concepts make it potentially of interest to other classes of readers as well, particularly general readers who feel the need of more fundamental understanding of arithmetic than they acquired in school. Considerable historical material is included on such topics as systems of notation. For the general reader the book's main value lies in its mature and illuminating discussions of such concepts as analysis, fractions, and approximate numbers.

Niven, Ivan

Irrational numbers New York Mathematical Association of America distributed by John Wiley and Sons Inc. 1956 164 p. 19 cm. $3 00 200

Contents Rationals and irrationals. Simple irrationalities. Certain algebraic numbers. The approximation of irrationals by rationals. Continued fractions. Further diophantine approximations. Algebraic and transcendental numbers. Normal numbers. The generalized Lindemann theorem. The Gelfond-Schneider theorem. List of notation. Glossary Reference books. Index of topics. Index of names.

Note An introductory exposition of irrational numbers which is addressed to such readers as teachers of mathematics and students preparing for careers in mathematics. The author has stated "Our general intention in this book is to characterize, classify and exhibit irrational numbers in various ways, not only in the framework of real numbers, but also in the larger setting of complex numbers W do not examine the axiomatic foundation of our subject. Each chapter includes section of "Notes, in which the author mentions related studies of other mathematicians and offers other information of interest to readers of the book.

Ore, Oystein

Number theory and its history New York McGraw Hill Book Company Inc. 1948 370 p illus 21 cm. $6 00 201

Content Counting and recording of numbers. Properties of numbers—division. Euclid's algorism. Prime numbers. The aliquot parts. Indeterminate problems. Theory of linear indeterminate problems. Diophantine problems. Congruences. Analysis of congruences. Wilson theorem and its consequences. Euler's theorem and its consequences. Theory of decimal expansions. The converse of Fermat's theorem. The classical construction problems. Bibliography General name index. Subject index.

Note Numbers and number theory have fascination for laymen as well as for professional mathematicians. This book is suitable for both groups even though it is based on an introductory course given at Yale University The greater part of it is elementary and requires only a knowledge of simple algebra for comprehension. On the other hand, the author's treatment of many topics is original and will appeal to mathematicians. History and exposition are skillfully interwoven, and the result is a clear and interesting book.

Pollard, Harry

The theory of algebraic numbers New York The Mathematical Association of America. Distributed by John Wiley and Sons, Inc. 1950 142 p 19 cm. (The Carus mathematical monographs No 9) $3 00 202

Content Divisibility The Gaussian primes. Polynomials over field. Algebraic number fields. Bases. Algebraic integers and integral bases. Arithmetic in algebraic number fields. The fundamental theorem of ideal theory Consequences of the fundamental theorem. Class-numbers and Fermat problem. Minkowski's lemma and the theory of units. References. Index.

Note An introductory presentation of classical algebraic number theory In general, theorems are proved, but in the case of Gelfond and Schneider' theorem for the transcendence of algebraic numbers, the reader is referred to a paper in a mathematical journal for the proof. The book is of interest to advanced students who are majoring in mathematics, to mathematicians who have specialized in other fields but with some knowledge of this one, and to lay readers who are mathematically mature and pursue mathematics as recreation

Siegel, Carl Ludwig

Transcendental numbers. Princeton Princeton University Press 1949 102 p 23 cm. (Annals of mathematics studies Emil Artin and Marston Morse editors Number 16) $2 00 203

Content The exponential function. Solutions of linear differential equations. The transcendency of a^b for irrational algebraic b and algebraic $a \neq 0,1$ Elliptic functions Bibliography

Note By exploiting some special transcendency problems, it is attempted in this study to evolve method of investigation which will be useful in the search for more general results and the formulation of a theory of transcendental numbers. Rather than one continuous argument, the work is a collection of essays originally presented as lectures at Princeton University in 1946.

Stewart, B M

Theory of numbers New York The Macmillan Company 1952 261 p illus. 22 cm $5 75 204

Content (abridged) Preliminary considerations. Mathematical induction. Representation of the integers. The fundamental theorem of arithmetic. Prime and composite integers. The bracket function. Groups of transformations—matrices and determinants. Diophantine equations of the first degree. Pythagorean triplets. Fermat's method of descent. Euler's phi-function. Introduction to the congruence notation. Linear congruences. Exponents, primitive roots, and indices. The quadratic reciprocity law Sums of four squares. Introduction to quadratic forms. Peano's axioms for the natural integers. Rational numbers. Decimal representation of rational numbers. The fundamental theorem reconsidered.

Note A textbook developed in courses given by the author at Michigan State University and designed as an introduction to number theory The treatment assumes that the reader will be familiar with the body of mathematical knowledge commonly referred to as "college algebra. The book is organized in 53 chapters, corresponding to as many 50-minute lectures. Each chapter ends with exercises for the reader to solve. Proofs are given for theorems.

THURSTON H. A.

The number-system. New York Interscience Publishers, Inc., 1956 134 p. 23 cm. $2.50. 205

Contents (abridged) Part I, Explanatory treatment. Counting. The laws of arithmetic. Fractions. Negative numbers. Fields. Irrational numbers. Powers. Complex numbers. Part II, Systematic treatment: Whole numbers. Half-groups and groups. Integers. Fields. Rational numbers. Exponentiation. Cauchy numbers. Real numbers. Complex numbers. Bibliography. Index.

Note An analytical interpretation and exposition of the number system is presented in this book. The first part is essentially descriptive. In it concepts are carefully defined and relations among them made clear. The second part is a formal treatment written mainly as theorems, lemmas and proofs. The book is addressed primarily to college students, however, the directness and simplicity of the author's style, together with his brevity, give it appeal for readers who desire to study the number system without the aid of an instructor.

USPENSKY JAMES VICTOR, AND M. A. HEASLET

Elementary number theory New York McGraw Hill Book Company Inc., 1939 484 p. illus. 21 cm. $7.00. 206

Contents Elementary properties of integers. Divisibility and related topics. Euclid's algorithm. Diophantine equations of the first degree. On prime numbers. A general combinatorial theorem and its applications. On the congruence of numbers. Congruences with one unknown. Lagrange's theorem and its applications. Residues of powers. Arithmetical properties of Bernoulli's numbers. Quadratic residues. Some problems connected with quadratic forms. Some Diophantine problems. Liouville's methods. Index.

Note An elementary textbook on number theory for the college student majoring in mathematics or for the interested undergraduate, covering the field of arithmetical investigation and the properties of numbers. The deep relations existing between polynomial numbers and integers in general are shown by means of several of Fermat's theorems. There is an extensive treatment on the congruence of numbers and quadratic residues, and many applications, such as magic squares, card shuffling, calendar calculations, and the like. No knowledge of mathematics higher than college algebra is required.

WEYL, HERMAN

Algebraic theory of numbers. Princeton Princeton University Press, 1940. 223 p. 22 cm. (Annals of mathematics studies. No 1) $3.00. 207

Contents Algebraic fields. Theory of divisibility (Kronecker Dedekind). Local p-adic analysis (Kummer Hensel). Algebraic number fields. Amendments.

Note This research is based on the notes of a course on theory of numbers given at Princeton University by the author. The work presents an outline of the fundamental arithmetic concepts and facts concerning algebraic fields. The author has subordinated Kronecker's approach to the problem of divisibility and has introduced the Kummer-Hensel p-adic theory as a method for penetrating more deeply into the subject. Hilbert's theory of Galois fields, Minkowski's geometric principle, finite Abelian groups, zeta function and related Dedekind sums, and the general theory of class fields are among the topics discussed. There is a selected bibliography of [illegible] books.

WRIGHT HARRY NOBLE

First course in theory of numbers. New York John Wiley & Sons Inc., 1939 108 p. illus. 22 cm. $2.90. 208

Contents Divisibility. Simple continued fractions. Congruences. Quadratic residues. Diophantine equations. Table of primes. Index.

Note A textbook for a one-semester course, prepared in connection with the course offered at City College, New York. The author has endeavored to make [illegible] relatively easy reading for the student, without loss of completeness. Exercises are provided, and the arrangement is designed to meet the needs of classroom use. Power residues and indices are used in the chapter on congruences to make possible relatively simple and interesting solutions of certain problems, and to form a natural introduction to the chapter on quadratic residues.

ANALYSIS

ADAMS EDWIN PLIMPTON, AND OTHERS

Smithsonian mathematical formulæ and tables of elliptic functions mathematical formulae prepared by Edwin P Adams. Tables of elliptic functions prepared under the direction of Sir George Greenhill, bart., by Col. R. L. Hippisley First reprint. Washington, D C. The Smithsonian Institution 1939 314 p. illus. 23 cm. (Smithsonian miscellaneous collections. Vol. 74 no. 1 Publication no. 2672) $3.00 209

Contents Symbols. Algebra. Geometry. Trigonometry. Vector analysis. Curvilinear coordinates. Infinite series. Special applications of analysis. Differential equations. Numerical solution of differential equations. Elliptic functions. Index.

Note A collection of the more useful results of mathematical analysis in formula form, designed for physicists, engineers, and others who regard mathematics as a tool and not as an end in itself. The formulae range from elementary to considerably advanced, and special applications of various theorems are also presented. The treatment of differential equations is particularly extensive and includes many special forms. The table of elliptic functions is preceded by a detailed explanation and description of their use. The first reprint contains corrections, but no new material.

AGNEW RALPH PALMER

Differential equations. New York McGraw Hill Book Company Inc., 1942 341 p. illus. 23 cm. $5.50. 210

Contents Introduction to differential equations. The differential equation $y' = f(x)$. Linear equations of first order. Families of curves; trajectories. Differential equations of first order and first degree. Linear differential equations. Use of series. Linear differential equations with constant coefficients. Mechanical problems. Electric circuits. Newton's equation $my'' = f(y)$ and the pendulum problem. Eigenvalues, Fourier series, and partial differential equations. Exact equations of first order. Integrating factors. Special methods of solving $f(x, y, y') = 0$; singular solutions. Picard's method of approximating solutions $y' = f(x, y)$; existence theorems. Approximations to solutions and existence theorems for equations of higher order and for systems of equations. Appendix. Bending of beams. Index.

Note An unusually thorough text designed to facilitate the mastery of those techniques by which differential equations are obtained and solved and by which the solutions are used in pure and applied mathematics.

AHLFORS LARS V

Complex analysis an introduction to the theory of analytic functions of one complex variable. New York McGraw Hill Book Company Inc., 1953 247 p. illus. 23 cm. (International series in pure and applied mathematics William Ted Martin consulting editor) $6.00. 211

Contents Complex numbers. Complex functions. Complex integration. Infinite sequences. The Dirichlet problem. Multiple-valued functions. Index.

Note An introduction to function theory designed for the instruction of university students in their first year of graduate study. The level of treatment assumes that the reader will have basic knowledge of real numbers and calculus. Classical methods are definitely emphasized; on the other hand, there are some novelties, such as the use of the concept of winding number in deriving a rigorous proof of Cauchy's integral theorem.

BACON, HAROLD MAILE

Differential and integral calculus Second edition New York McGraw Hill Book Company, Inc., 1955 547 p illus 24 cm $6 00 212

Contents Preface. Introduction. Functions and limits. The derivative. General rules for differentiation of algebraic functions. Simple applications of the derivative. Differentiation of trigonometric and inverse trigonometric functions. Differentiation of logarithmic and exponential functions. The differential. Further applications of derivatives and differentials. Polar coordinates. Theorem of the mean, indeterminate forms, and Taylor's theorem. Integration, standard forms. Methods of integration. The definite integral. Geometric applications of the definite integral. Physical applications of the definite integral. Partial differentiation. Multiple integrals. Infinite series. Introduction to differential equations. Brief table of integrals. Answers to odd-numbered problems. Index.

Note. The standard topics of an introductory undergraduate course in calculus as taught in colleges and universities in the United States of America are covered in this book. The treatment is not mathematically rigorous. Difficult proofs are omitted however special attention is given to explicit and carefully phrased definitions. A special feature is a detailed expository text, written so the student can read and understand it without constant assistance from an instructor The first edition was published in 1942 Various revisions in text and problems have been made in this second edition; however the scope and purpose of the book are unchanged. The author is Professor of Mathematics in Stanford University

BATEMAN MANUSCRIPT PROJECT

Higher transcendental functions Based, in part, on notes left by Harry Bateman. And compiled by the staff of the Bateman Manuscript Project. New York McGraw Hill Book Company, Inc 1953–55 3 v 24 cm. (California Institute of Technology Bateman Manuscript Project, A Erdélyi, editor) Vol. I, $6 50, vol II $7 50 vol. III, $6 50 213

Contents. Volume I The gamma function. The hypergeometric function. Legendre functions. The generalized hypergeometric series. Further generalizations of the hypergeometric function. The confluent hypergeometric function. Subject index. Index of notations. Volume II Bessel functions. Functions of the parabolic cylinder and of the paraboloid of revolution. The incomplete gamma function and related functions. Orthogonal polynomials. Spherical and hyperspherical harmonic polynomials. Orthogonal polynomials in several variables. Elliptic functions and integrals. Subject index. Index of notations. Volume III Automorphic functions. Lamé functions. Mathieu functions, spheroidal and ellipsoidal wave functions. Introduction to the functions of number theory. Miscellaneous functions. Generating functions. Subject index. Index of notations.

Note. A voluminous collection of notes made by Professor Harry Bateman of the California Institute of Technology in preparation for comprehensive work on special functions was the starting point of this work. When death cut short Professor Bateman's ork on the project, the California Institute of Technology and the United States Office of Naval Research organized group of mathematicians headed by Professor Arthur Erdélyi, to continue it. This treatise is product of the group. Organized into chapters whose titles are given above, it presents wide range of information on the transcendental functions The chapters vary in organization and scope but, generally speaking each is a condensed survey intended for reading or reference by graduate pure and applied mathematicians, of a specific class of transcendental functions and designed to orient the reader in the subject. The principal literature is mentioned, often with an evaluatory comment typical computations are illustrated, and proof are demonstrated.

BATEMAN MANUSCRIPT PROJECT

Tables of integral transforms. Based in part, on notes left by Harry Bateman. New York McGraw Hill Book Company Inc. 1954 2 v (California Institute of Technology Bateman Manuscript Project, A Erdélyi, editor) Vol I $7 50, vol. II, $8 00 214

Contents: Volume I Part I, Fourier transforms Fourier cosine transforms. Fourier sine transforms. Exponential Fourier transforms. Part II, LaPlace transforms. Inverse LaPlace transforms. Part III, Mellin transforms: Inverse Mellin transforms. Appendix. Index of notations. Volume II Part IV Bessel transforms. Hankel transforms of order Y-transforms. K-transforms. H-transforms. Kontorovich-Lebedev transforms. Part V Miscellaneous transforms Fractional integrals. Stieltjes transforms. Hilbert transforms. Part VI, I tegrals of higher transcendental functions: Orthogonal polynomials. Gamma function, incomplete gamma functions and related functions. Legendre functions. Bessel functions. Hypergeometric functions. Appendix. Index of notations.

Note. A complementary work to Bateman Memorial Project, *Higher transcendental functions*, described in the preceding entry It presents in tabular form wide range of integral transforms, classified under the headings listed above and, in addition, a smaller collection of integrals of higher transcendental functions, most of which can not be written as transforms. It was based partly on the manuscript collections of the late Professor Bateman but contains also transforms and integrals from the periodical literature and some not previously published. In some instances, the material presented in specific sections supplements other books in others, there is no similar material in book form. Literature references are included.

BELLMAN, RICHARD

Stability theory of differential equations. New York McGraw Hill Book Company, Inc., 1953 166 p 23 cm. $5 50 (International series in pure and applied mathematics, William Ted Martin, consulting editor) $5 50 215

Contents. Properties of linear systems. Stability boundedness, and asymptotic behavior of solutions of linear systems. The existence and uniqueness of solutions of nonlinear systems. The stability of solutions of nonlinear differential equations. The asymptotic behavior of the solutions of some nonlinear equations of the first order The second-order linear differential equation. The Emden-Fowler equation. Index.

Note. An introduction at the first-year graduate level to the modern theory of stability and asymptotic behavior of solutions f real equations. The material presented has been carefully selected. The author states that "no attempt has been made to be encyclopedic and to catalogue every result that possibly falls within our scope. This is neither feasible nor desirable in an introductory volume. A selected number of powerful techniques are presented, and bibliographical references are given to books and journal articles in which others may be found.

BERGMAN, STEFAN

The kernel function and conformal mapping New York American Mathematical Society, 1950 161 p 26 cm. (American Mathematical Society Mathematical surveys. No. v) $4 00 216

Contents. Orthogonal functions. The kernel function and associated minimum problems. The invariant metric and the method of the minimum integral. Kernel functions and Hilbert space. Representation of the classical domain functions. Canonical conformal transformations. Orthogonalization over the boundary Variational methods. Existence proofs. Partial differential equations Functions of two complex variables and pseudo-conformal mapping. Bibliography Index.

Note This survey presents a number of methods and principles which are of wide applicability in such branches of analysis as function theory partial differential equations, differential geometry etc. The special emphasis here, however is on conformal mappings. The underlying idea is to consider those classes of functions in which a norm can be introduced and the notion of orthogonality defined. For each complete system of orthonormal functions in the class kernel function is defined. The classical domain functions, such as Green's and Neumann harmonic measures, etc are shown to be intimately related to the kernel function. Since the latter is defined in terms of an orthonormal system, it is possible to solve many conformal mapping problems numerically To read this volume a considerable mathematical background is required.

Bers, L. and others, editors

Contributions to the theory of partial differential equations. Edited by L. Bers S Bochner and F John. The papers in this volume were read at the Conference on Partial Differential Equations sponsored by the National Academy of Sciences—National Research Council, October 1952 Princeton Princeton University Press, 1954 257 p. 26 cm. (Annals of mathematics studies edited by Emil Artin and Marston Morse. No. 33) $4 00. 217

Contents: Green formula and analytic continuation, by S. Bochner. Strongly elliptic systems of differential equations, by F. E. Browder. Derivatives of solutions of linear elliptic partial differential equations, by F John. On multi-valued solutions of linear partial differential equations, by S. Bergman. Function-theoretical properties of solutions of partial differential equations of elliptic type, by L. Bers. On a generalization of quasi-conformal mappings and its application to elliptic partial differential equations, by L. Nirenberg. Second order elliptic systems of differential equations, by C. B. Morrey. Conservation laws of certain systems of partial differential equations and associated mappings, by C. Loewner. Parabolic equations, by P D Lax and A. N. Milgram. Linear equations of parabolic type with constant coefficients, by P. C. Rosenbloom. On linear hyperbolic differential equations with variable coefficients on a vector space, by J. Leray. The initial value problem for non-linear hyperbolic equations in two independent variables, by P D Lax. A geometric treatment of linear hyperbolic equations of second order, by A. Douglis. On Cauchy's problem and fundamental solutions, by J. B. Diaz. A boundary value problem for the wave equation and mean value theorems, by M. H Protter.

Note: Papers read at the Conference on Partial Differential Equations organized and sponsored by the National Academy of Sciences—National Research Council, and held at Arden House, New York, in October 1952, are published in this volume. The authors and titles are listed above. Generally speaking, the papers report original research, and are addressed to graduate mathematicians who are interested in the study of the theory of partial differential equations. As printed in this volume, most of the papers include bibliographies.

Bliss, Gilbert Ames

Lectures on the calculus of variations. Chicago University of Chicago Press, 1946 296 p. illus. 23 cm. $6.00 218

Contents: Part I, Simpler problems of the calculus of variations: The calculus of variations in three-space. Sufficient conditions for minima. Fields and the Hamilton-Jacobi theory. Problems in the plane and in higher spaces. Problems in parametric form. Problems with variable end-points. Part II, The problem of Bolza. The multiplier rule. Further necessary conditions for a minimum. Sufficient conditions for a minimum. Appendix. Existence theorems for implicit functions and differential equations. A bibliography for the problem of Bolza. Index.

Note: The first part of this work introduces the reader to the modern theories of the calculus of variations. The second and more advanced part embodies the results of studies by the author and his pupils of the problem of Bolza. The book contains material of interest to professional mathematicians, particularly in the second part. It is also used as a text in graduate mathematics and physics courses. The bibliography of the problem of Bolza cites 77 books and periodical articles.

Bernstein, Dorothy Lewis

Existence theorems in partial differential equations. Princeton Princeton University Press 1950. 228 p illus. 25 cm. (Annals of mathematics studies Emil Artin and Marston Morse, editors. No. 23) $2.50 219

Contents: Introduction. The initial value problem and the problem of Cauchy for first order differential equations. Second order differential equations. Partial differential equations of order > 2. Bibliography.

Note: This study is intended to list the existence theorems used in solving partial differential equations, with special emphasis on those which may be utilized in the solution of such equations by means of digital computing machines. Two opposite approaches to the use of computing machines in problems involving partial differential equations are illustrated by (1) those persons who believe that computing machines can be used to solve all such problems if the equations are set up correctly and (2) those who will not attempt to use them in solving a partial differential equation unless it can be shown to have at least one unique solution. In this book an attempt has been made to reach a compromise by providing the reader with an opportunity to draw an analogy between his problem and the ones the author has worked out. This should enable him to see if a solution exists for his problem. The author is Professor of Mathematics in the University of Rochester.

Boas, Ralph Philip jr.

Entire functions. New York Academic Press Inc., 1954 276 p. illus. 24 cm. (Pure and applied mathematics a series of monographs and textbooks edited by Paul A. Smith and Samuel Eilenberg) $7.00 220

Contents: Introduction. General properties of entire functions of finite order. The minimum modulus. Functions with real negative zeros. General properties of functions of exponential type. Functions of exponential type, restricted on a line—theorems on the large—asymptotic behavior in a half plane. Functions of exponential type—connections between growth and distribution of zeros. Uniqueness theorems. Growth theorems. Operators and their extremal properties. Applications. Bibliography. Index. Index of notations.

Note: The greater part of this book is devoted to functions of exponential type. The author explains the title thus: "My chief aim has been to give an account of the extensive modern theory of functions of exponential type the natural domain for these functions is often a half plane or an angle rather than the whole plane. Thus this book is not a comprehensive treatise on entire functions and is not concerned exclusively with entire functions. However a short and reasonably accurate title seemed preferable to a longer and more descriptive one." Proofs are given for most theorems but in a few instances the theorems are only stated and are marked with asterisks to indicate that the proofs are not included. The last chapter is a survey of applications of entire functions of exponential type to attacking problems in other areas of mathematics. The bibliography though limited to books and papers referred to in the text, is an extensive one.

Bochner, Salomon and K. Chandrasekharan

Fourier transforms. Princeton Princeton University Press 1949 219 p. 23 cm. (Annals of mathematics studies. No. 19) $3.50 221

Contents: Fourier transforms in L_1 (one variable). Fourier transforms in L_1 (several variables). L_2-spaces. Fourier transforms in L_2. General transforms in L_2. General Tauberian theorem. Notes. Glossary.

Note. A series of studies of interest to advanced graduate students and professional mathematicians. Altogether, 93 theorems are stated and proved.

Bochner, Salomon and William Ted Martin

Several complex variables. Princeton Princeton University Press, 1948 216 p. illus. 23 cm. (Princeton mathematical series Marston Morse and others, editors) $4.00 222

Contents: Groups of transformations by formal power-series. Basic facts about analytic functions of real and complex variables. Analytic mappings with a fixed point. Analytic completion. Singularities at boundary points. Inequalities, bounds and norms. The theory of Hartogs—subharmonic functions. Removable singularities. Algebraic theorems. Local analytic varieties. Index.

Note: An introductory presentation for graduate students and mathematicians. The authors have assumed that the reader will have studied advanced calculus and will be familiar with the elementary concepts associated with the Lebesgue integral.

BACON, HAROLD MAILE

Differential and integral calculus Second edition New York McGraw Hill Book Company, Inc., 1955 547 p illus 24 cm $6 00 212

Content Preface. Introduction. Functions and limits. The derivative. General rules for differentiation of algebraic functions. Simple applications of the derivative. Differentiation of trigonometric and inverse trigonometric functions. Differentiation of logarithmic and exponential functions. The differential. Further applications of derivatives and differentials. Polar coordinates. Theorem of the mean, indeterminate forms, and Taylor's theorem. Integration, standard forms. Methods of integration. The definite integral. Geometric applications of the definite integral. Physical applications of the definite integral. Partial differentiation. Multiple integrals. Infinite series. Introduction to differential equations. Brief table of integrals. Answers to odd-numbered problems. Index.

Note The standard topics of an introductory undergraduate course in calculus as taught in colleges and universities in the United States of America are covered in this book. The treatment is not mathematically rigorous. Difficult proof are omitted however special attention is given to explicit and carefully phrased definitions. A special feature is a detailed expository text, ritten so the student can read and understand it without constant assistance from an instructor The first edition was published in 1942 Various revisions in text and problems have been made in this second edition; however the scope and purpose of the book are unchanged. The author is Professor of Mathematics in Stanford University

BATEMAN MANUSCRIPT PROJECT

Higher transcendental functions Based in part, on notes left by Harry Bateman And compiled by the staff of the Bateman Manuscript Project. New York McGraw Hill Book Company Inc., 1953–55 3 v 24 cm. (California Institute of Technology Bateman Manuscript Project, A. Erdélyi editor) Vol. I, $6 50 vol II, $7 50 vol. III, $6 50 213

Contents Volume I The gamma function. The hypergeometric function. Legendre functions. The generalized hypergeometric series. Further generalizations of the hypergeometric function. BERGMAN, STEFAN

The kernel function and conformal mapping New York American Mathematical Society 1950 161 p. 26 cm. (American Mathematical Society Mathematical surveys. No V) $4 00 216

Content Orthogonal functions. The kernel function and associated minimum problems The invariant metric and the method of the minimum integral. Kernel functions and Hilbert space. Representation of the classical domain functions. Canonical conformal transformations. Orthogonalization over the boundary Variational methods. Existence proofs. Partial differential equations. Functions of two complex variables and pseudo-conformal mapping. Bibliography Index.

Note This survey presents number f methods and principles which are f wide applicability in such branches of analysis as function theory partial differential equations, differential geometry etc. The special emphasis here, however is on conformal mappings The underlying idea is to consider linear classes of functions in which norm can be introduced and the notion of orthogonality defined. For each complete system of orthonormal functions in the class kernel function is defined. The classical domain functions, such as Green's and Neumann harmonic measures, etc., are shown to be intimately related to the kernel function. Since the latter is defined in terms f an orthonormal system, it is possible to solve many conformal mapping problems numerically T read this volume considerable mathematical background is required.

CODDINGTON, EARL A. AND NORMAN LEVINSON

Theory of ordinary differential equations. New York McGraw Hill Book Company Inc., 1955 429 p. illus. 24 cm (International series in pure and applied mathematics W T Martin, consulting editor) $8.50 230

Contents: Existence and uniqueness of solutions. Linear differential equations. Linear systems with isolated singularities—singularities of the first kind—singularities of the second kind. Asymptotic behavior of linear systems containing a large parameter. Self-adjoint eigenvalue problems on a finite interval. Oscillation and comparison theorems for second-order linear equations and applications. Singular self-adjoint boundary-value problems for second-order equations. Singular self-adjoint boundary-value problems for nth-order equations. Algebraic properties of linear boundary-value problems on a finite interval. Non-self-adjoint boundary-value problems. Asymptotic behavior of nonlinear systems—stability. Perturbation of systems having a periodic solution. Perturbation theory of two-dimensional real autonomous systems. The Poincaré-Bendixson theory of two-dimensional autonomous systems. Differential equations on a torus. References. Index.

Note: Although organized for use as a text, this book is a broad and rigorous treatment of the theory of ordinary differential equations. It contains original results developed by the authors, in addition to material taken from the published literature. It is of interest to graduate mathematicians as well as to graduate students.

COURANT, RICHARD

Differential and integral calculus. Translated by E. J. McShane. New York Interscience Publishers, Inc. 1936–37 2 vols. 22 cm. illus. Vol. i, $6.00 vol. ii, $7.50 231

Contents (abridged): Volume i: The fundamental ideas of the integral differential calculus. Differentiation and integration of the elementary functions. Further development of the integral calculus. Applications. Taylor's theorem and the approximate expression of functions by polynomials. Numerical methods. Infinite series and other limiting processes. Fourier series. A sketch of the theory of functions of several variables. The differential equations for the simplest types of vibration. Summary of important theorems and formulas. Miscellaneous examples. Answers and hints. Index. Volume ii: Preliminary remarks on analytical geometry and vector analysis. Functions of several variables and their derivatives. Developments and applications of the differential calculus. Multiple integrals. Integration over regions of several dimensions. Differential equations. Calculus of variations. Functions of a complex variable. Supplement: Real numbers and the concept of limit. Miscellaneous examples. Summary of important theorems and formulas. Answers and hints. Index.

Note: This work has achieved the status of a classic exposition of the calculus. First published in the German language, the translation was made by an eminent American mathematician after Professor Courant took up residence in the United States of America. The English translation is arranged somewhat differently and contains matter not in the German original, these alterations having been made in collaboration between the author and translator. The presentation is concise and mathematically rigorous, but the author incorporated several features to make the work attractive rather than formidable. The discussions, especially those in the first volume, are written out fully and certain fundamental though difficult concepts and techniques are segregated in appendices to the separate chapters where they can be skipped at first reading if necessary. A considerable number of worked examples are included as well as problems for the reader. A current set consists of Volume i, second edition, 1937 and Volume ii, first edition, 1936.

DOUGLASS, RAYMOND DONALD AND SAMUEL D ZELDIN

Calculus and its applications. New York Prentice-Hall Inc., 1947 568 p. illus 21 cm. (Prentice Hall mathematics series Albert A. Bennett, editor) $5 75 232

Contents: Functions and limits. Differentiation. Applications; maxima and minima, rates. Differential and integral. Differentiation and integration of trigonometric and exponential functions. Summation and definite integration. Methods of integration. Geometrical applications and parametric equations. Polar coordinates. Centroid and moment of inertia. Partial differentiation. Double integration. Infinite series. Ordinary differential equations. Vectors. Mathematical tables. Answers to exercises. Index.

Note: In this college text the authors have made an effort to adapt their subject to meet the special needs of students of the physical and engineering sciences. The form of presentation is concise, with proofs of formulas and explanatory discussions reduced to a minimum. Numerous worked-out examples and review problems are used to illustrate the applications of calculus to the solution of scientific and engineering problems. The authors are Professors of Mathematics at Massachusetts Institute of Technology

DWYER, PAUL SUMNER

Linear computations. New York John Wiley & Sons Inc., 1951 344 p 24 cm. (Wiley publications in statistics Walter A. Shewhart, editor) $7.00 233

Contents (abridged): Computation with approximate numbers. The principles of computational design. The solution of simultaneous equations with the method of multiplication and subtraction. The method of multiplication and subtraction with (exact) division—method of determinants. The solution of equations with approximate methods. Relations between the coefficients. The evaluation of determinants and determinantal ratios. The evaluation of linear forms. An introduction to the algebra of matrices. The inverse matrix and its calculation with approximate methods. The calculation of the adjoint and inverse with the method of determinants. Other methods. The errors of linear computations. Application to statistics. Author references. Index.

Note: The author has published many papers on problems pertaining to the solution of simultaneous linear equations. In this book, he has synthesized the material and presented it especially for those who are not specialists in mathematics. In his words, "special emphasis is given to solutions with direct pivotal condensation methods that are particularly applicable to the modern desk calculator." The first chapter contains a concise discussion of certain fundamental operations of modern computing machines and a helpful bibliography. The book is of interest to scientific workers in many fields, including statistics.

ERDÉLYI, A.

Asymptotic expansions. New York Dover Publications, Inc., 1956 108 p. illus 21 cm. $1.35 234

Contents: Asymptotic series. Integrals. Singularities of differential equations. Differential equations with a large parameter.

Note: As pointed out in the introduction to this book, asymptotic series are also called "semi-convergent series" and "convergently beginning series." The book is an introduction to various methods for the asymptotical evaluation of integrals containing a large parameter and to the study of solutions of ordinary linear differential equations by asymptotic expansion techniques. The first chapter deals rather briefly with the general theory. The second chapter is a presentation of important methods, such as Laplace's method, the method of steepest descent, and the method of stationary phase. In the last two chapters, the theory and techniques are applied to the solution of ordinary differential equations having an independent variable or a parameter as the "large" quantity. The book was first published as an Office of Naval Research report. This edition, which contains the unaltered text of the ONR report, is the first trade edition.

FLUGGE, W

Four-place tables of transcendental functions. New York Pergamon Press Inc., 1954 136 p. 23 cm. $3 00. 235

Contents: Instructions for the use of the tables. Trigonometric and hyperbolic functions. Exponential function and logarithm. Bessel functions. Theta functions. Elliptic integrals. Miscellaneous transcendental functions. Transcendental constants.

Note: This book of tables of transcendental functions is designed as a working tool for the engineer and the physicist. It has been compiled from many large volumes of multi-digit mathematical tables, in order to make a selection of the most useful tables available in handy form for frequent use. Prepared for use with the slide rule, it contains values of functions commonly used with and also a collection of those formulas which are needed to handle the functions.

BRAND, LOUIS

Advanced calculus an introduction to classical analysis New York John Wiley & Sons, Inc., 1955 574 p 24 cm $8 50 223

Contents The number system. Sequences and series. Functions of a real variable. Functions of several variables. Vectors. The definite integral. Improper integrals. Line integrals. Multiple integrals. Uniform convergence. Functions of a complex variable. Fourier series. Appendixes. Comprehensive text. Answers to problems. Index.

Note: A systematic exposition of classical analysis, that is, of the functions of a real variable. The chapter on functions of a complex variable has been included only because it is essential to a full understanding of real variable theory The presentation is mathematically rigorous however the uthor has made use of several devices to facilitate comprehension on the part of the reader These include numerous examples in the expository text problems for the reader inserted close to the exposition on which they are based, rather than at the end of the chapter; and concise chapter summaries. The uthor is Head of the Department of Mathematics f the University of Cincinnati.

BRITTON, JACK R.

Calculus. New York Rinehart and Company, Inc., 1956 584 p illus 23 cm (C. V Newsom, consulting editor) $6 50 224

Contents The velocity and the tangent problems. Some fundamental notions. The derivative and its direct interpretations. The derivative of a power and of polynomial additional applications. The limit concept and continuity Theorems on derivatives. Maximum and minimum value problems. Differentials. The definite integral. The exponential and logarithmic functions. The trigonometric and inverse trigonometric functions. Methods of integration. Rate problems; curvilinear motion. Further applications of integration. The mean value theorem. Infinite series. Power series and expansion of functions. Hyperbolic functions. Approximate integration. Partial differentiation. Applications of partial differentiation. Multiple integrals. Differential equations. The use of table of integrals. Appendixes Some infinite series for reference. Curves for reference. Numerical tables. Answers to odd-numbered problems. Index.

Note A textbook designed for use in full-length introductory college courses. Its principal features include good organization and full, readable explanations which do not sacrifice mathematical rigor The author is Professor of Applied Mathematics in the University of Colorado.

BUCK, R CREIGHTON

Advanced calculus New York McGraw Hill Book Company Inc., 1956 423 p illus. 23 cm. (International series in pure and applied mathematics, William Ted Martin, consulting editor) $8 50 225

Content Elementary topology Functions. Integration. Convergence. Differentiation. Applications to geometry and analysis. Elements of differential geometry Appendix Foundations of the number system. Answers and hints. List of symbols. Index.

Note. A college text designed for the instruction of students who have completed courses in elementary calculus. It is devoted primarily to the differential and integral calculus of functions and transformations. In most sections the treatment is mathematically rigorous, *but occasionally the reader is referred to other* books for proofs. Several hundred exercises for the reader to solve are included, and answers are furnished for most of them.

CAMP, E J

Mathematical analysis, an introduction for college students Boston D C Heath and Company 1956 610 p illus 24 cm. $6 50 226

Contents Coordinates, graphs, and functions. Sequences, series, and limits. Derivatives. Antiderivatives. Polynomials and equations of first degree. Extension of the number system. Polynomials and equations of second degree—of higher degree. Exponents and radicals. Algebraic functions, rational and irrational. Exponential and logarithmic functions. Trigonometric functions and applications. Radian measure—graphs of the trigonometric functions. Fundamental identities—trigonometric equations. Solution of oblique triangles. Inverse trigonometric functions—trigonometric equations. Systems of first-degree equations—determinants. Equations of geometric loci—the circle. The conic sections. Polar coordinates. Transformation of coordinates. Parametric equations. Analytic geometry of points, lines, and planes in three dimensions. Quadric surfaces. Permutations, combinations, and probability Tables. Answers. Index.

Note. A well-organized, modern text designed for use in courses at the beginning undergraduate level which are offered to students who have studied algebra in secondary school. The author is Chairman of the Department of Mathematics of Macalester College.

CHEVALLEY, CLAUDE

Introduction to the theory of algebraic functions of one variable. New York American Mathematical Society, 1951 188 p 26 cm. (American Mathematical Society Mathematical surveys No VI) $4 00 227

Contents Places and divisors. The theorem of Riemann-Roch. The *p*-adic completions. Extensions of fields of algebraic functions of one variable. Extensions of the field of constants. Exact differentials. The Riemann surface. Index.

Note Expositions of the theory of algebraic functions of one variable are more or less bound to lay more emphasis either on the algebraico-arithmetic aspect of the subject or the geometric aspect. This book favors the algebraico-arithmetic approach as originally advanced by Dedekind and Weber and later developed by Hensel and Landsberg. The main difference between the present treatment and earlier ones is that the constants of the fields of algebraic functions to be considered are not necessarily the complex numbers but the elements of a completely arbitrary field. This book includes only the elementary part of the theory More advanced topics, such as class field theory and the theory f correspondences, have been omitted. However a suitable background of knowledge for the study of these more advanced topics has been provided.

CHURCHILL, RUEL VANCE

Fourier series and boundary value problems New York McGraw Hill Book Company, Inc., 1941 206 p illus 23 cm $4 50 228

Contents Introduction. Partial differential equations of physics. Orthogonal sets of functions. Fourier series. Further properties of Fourier series Fourier integrals. Solution f boundary value problems by the use of Fourier series and integrals. Uniqueness of solutions. Bessel functions and applications. Legendre polynomials and applications. Index.

Note Presents an introductory treatment of Fourier series and their application to the solution f boundary value problems in the partial differential equations of physics and engineering. The book seeks first to equip the student with that part of the theory of orthogonal sets of functions which is essential to the usual applications arising in the physical sciences and second, to give him thorough knowledge of the classical process of solving boundary value problems in partial differential equations, with the aid of those expansions in series of orthogonal functions.

CHURCHILL, RUEL VANCE

Introduction to complex variables and applications. New York McGraw Hill Book Company Inc., 1948 216 p illus. 23 cm $5.50 229

Contents Complex numbers. Analytic functions. Elementary functions. The geometry of elementary functions. Integrals. Power series. Residues and poles. Conformal mapping. Applications of conformal mapping. The Schwarz-Christoffel transformation. Analytic continuation. Riemann surfaces. Appendices Bibliography Table of transformations of regions. Index.

Note. The major portion f this text outlines the basic concepts and theory of complex variables as utilized in solving linear boundary value problems. Particular emphasis is placed on the theory of residues and conformal mapping The practical application of these methods to problems in potentials, steady temperatures, and flow of fields is covered briefly in the four final chapters. The treatment is concise and intended for the use of graduate students in physics, engineering, and mathematics.

CODDINGTON, EARL A. AND NORMAN LEVINSON

Theory of ordinary differential equations. New York McGraw Hill Book Company Inc., 1955 429 p. illus. 24 cm. (International series in pure and applied mathematics W T Martin, consulting editor) $8.50 230

Contents: Existence and uniqueness of solutions. Linear differential equations. Linear systems with isolated singularities—singularities of the first kind—singularities of the second kind. Asymptotic behavior of linear systems containing a large parameter. Self-adjoint eigenvalue problems on a finite interval. Oscillation and comparison theorems for second-order linear equations and applications. Singular self-adjoint boundary-value problems for second-order equations. Singular self-adjoint boundary-value problems for nth-order equations. Algebraic properties of linear boundary-value problems on a finite interval. Non-self-adjoint boundary-value problems. Asymptotic behavior of nonlinear systems—stability. Perturbation of systems having a periodic solution. Perturbation theory of two-dimensional real autonomous systems. The Poincaré-Bendixson theory of two-dimensional autonomous systems. Differential equations on a torus. References. Index.

Note: Although organized for use as a text, this book is a broad and rigorous treatment of the theory of ordinary differential equations. It contains original results developed by the authors, in addition to material taken from the published literature. It is of interest to graduate mathematicians as well as to graduate students.

COURANT RICHARD

Differential and integral calculus. Translated by E. J McShane. New York Interscience Publishers Inc., 1936–37 2 vols. 22 cm. illus. Vol. i, $6.00 vol. ii, $7.50 231

Contents (abridged): Volume i: The fundamental ideas of the integral differential calculus. Differentiation and integration of the elementary functions. Further development of the integral calculus. CHEVALLEY, CLAUDE

Introduction to the theory of algebraic functions of one variable. New York American Mathematical Society, 1951 188 p 26 cm. (American Mathematical Society Mathematical surveys. No vi) $4 00 227

Contents Places and divisors. The theorem of Riemann-Roch. The *p*-adic completions. Extensions of fields of algebraic functions of one variable. Extensions of the field of constants. Exact differentials. The Riemann surface. Index.

Note. Expositions of the theory of algebraic functions of one variable are more or less bound to lay more emphasis either on the algebraico-arithmetic aspect of the subject or the geometric aspect. This book favors the algebraico-arithmetic approach as originally advanced by Dedekind and Weber and later developed by Hasse and Landsberg. The main difference between the present treatment and earlier ones is that the constants of the fields of algebraic functions to be considered are not necessarily the complex numbers but the elements of completely arbitrary field. This book includes only the elementary part of the theory More advanced topics, such as class field theory and the theory of correspondences, have been omitted. However a suitable background of knowledge for the study of these more advanced topics has been provided.

CHURCHILL, RUEL VANCE

Fourier series and boundary value problems New York McGraw Hill Book Company, Inc., 1941 206 p illus 23 cm $4 50 228

Contents. Introduction. Partial differential equations of physics. Orthogonal sets of functions. Fourier series. Further properties of Fourier series Fourier integrals. Solution of boundary value problems by the use of Fourier series and integrals. Uniqueness of solutions. Bessel functions and applications. Legendre polynomials and applications. Index.

Note. Presents an introductory treatment of Fourier series and their application to the solution of boundary value problems in the partial differential equations of physics and engineering. The book seeks first to equip the student with that part of the theory f orthogonal sets f functions which is essential to the usual applications arising in the physical sciences and second, to give him thorough knowledge of the classical process of solving boundary value problems in partial differential equations, with the aid of these expansions in series of orthogonal functions.

CHURCHILL, RUEL VANCE

Introduction to complex variables and applications. New York McGraw Hill Book Company, Inc., 1948 216 p illus. 23 cm. $5 50 229

Contents. Complex numbers. Analytic functions. Elementary functions. The geometry of elementary functions. Integrals. Power series. Residues and poles. Conformal mapping. Applications f conformal mapping. The Schwarz-Christoffel transformation. Analytic continuation. Riemann surfaces. Appendixes Bibliography Table of transformations of regions. Index.

Note The major portion of this text outlines the basic concepts and theory of complex variables as utilized in solving linear boundary value problems. Particular emphasis is placed on the theory of residues and conformal mapping. The practical application of these methods to problems in potentials, steady temperatures, and flow of fluids is covered briefly in the four final chapters. The treatment is concise and intended for the use of graduate students in physics, engineering, and mathematics.

HALMOS PAUL RICHARD

Measure theory Princeton D Van Nostrand Company Inc., 1950 304 p illus. 24 cm. (The university series in higher mathematics editorial board, M H. Stone chairman) $6.25 243

Contents: Sets and classes. Measures and outer measures. Extension of measures. Measurable functions. Integration. General set functions. Product spaces. Transformations and functions. Probability. Locally compact spaces. Haar measure. Measure and topology in groups. References. Bibliography. List of frequently used symbols. Index.

Note: This work is both a textbook for graduate students of mathematics and a treatise of interest to professional mathematicians who are working in the more advanced areas of analysis and topology. The text proper is limited more or less to the fundamentals of measure theory but in certain of the exercises the author has assumed on the part of the reader knowledge of advanced concepts in topology, etc. Thus he has made the book of interest both to beginners and to those who have done previous work in the field. He is Associate Professor of Mathematics at the University of Chicago.

HART WILLIAM L.

Calculus. Boston D C. Heath and Company 1955 626 p. illus. 24 cm. $6.50 244

Contents: Rates of change. Limits. The derivative. Differentiation of algebraic functions. [illegible] Applications of derivatives. Differentials and parametric form. Differentiation of transcendental functions. Applications to polar coordinates. Mean value theorem. Introduction to definite integrals. Integration by standard forms. Integration by special methods. Applications of definite integrals. Advanced integration. Length of arc and curvature. Solid analytic geometry. Introduction to partial differentiation. Double integrals. Moments in a plane. Triple integrals. Infinite series. Expansion of functions. Advanced topics in partial differentiation. Envelopes, space curves, and surfaces. Advanced applications of partial derivatives. Hyperbolic functions. Differential equations. Appendix. Answers to exercises. Index.

Note: A substantial introductory designed for instruction of college students who are taking their first course in calculus. It has a number of interesting pedagogical features and is published in an attractive format. The author is a member of the faculty of the University of Minnesota.

—— Tables of the Bessel functions of the first kind of orders seventy-nine through one hundred thirty-five. Cambridge Mass Harvard University Press, 1951 614 p. 27 cm. (Harvard University Computation Laboratory Annals. Vol. XIV) o.p. 256

FORD, LESTER R

Differential equations Second edition. New York McGraw Hill Book Company, Inc., 1955 291 p illus 24 cm. $5 00 236

Contents Introduction to differential equations. Special methods for the equation of the first order Linear equations of the second order General linear equations. The method of successive approximations. Systems of ordinary equations. Certain classical equations. Interpolation and numerical integration The numerical solution of differential equations. Partial differential equations of the first order Partial differential equations of the second order Index.

Note A long-established college textbook, the first edition of which was published in 1933 In the introductory material and in connection with equations of the first order geometrical and intuitive aspects are emphasized, and use is made of graphical elements to give the student a pictorial view of problems. In chapters that follow the introductory one, the treatment is more rigorous and makes less use of graphical representation. Although the level and general scope of the book have not been changed in this second edition important revisions and additions have been made in both the text and problems. Expository matter now includes more fully worked examples. Also added are several topics, including Riccati's equation and the Laplace transform. Answers are not included for all the problems.

FRANKLIN, PHILIP

Methods of advanced calculus. New York *McGraw Hill Book Company, Inc., 1944* 486 p illus 21 cm $7 00 237

Contents (abridged) Elementary functions for complex values and Taylor's series. Partial differentiation and implicit functions. Vectors, curves, and surfaces in space. Integration. The definite integral. Multiple integrals. Line integrals. Complex variables. The gamma function and related definite integrals. Elliptic integrals. Vector analysis. Differential equations. Legendre polynomials and Bessel functions. Fourier series and partial differential equations. The calculus of variations and LaGrange's equations. Bibliography Answers. Index.

Note A standard exposition designed primarily for the instruction of advanced students of science and engineering. Elementary calculus is reviewed in the first chapter then follow treatments of the topics named in the chapter titles listed above.

FRANKLIN, PHILIP

A treatise on advanced calculus including *those parts of the theory of functions of real* and complex variables which form the logical basis of the infinitesimal calculus and its applications to geometry and physics. New York John Wiley & Sons Inc. 1940 595 p *illus 23 cm. $7 50* 238

Content Real numbers. Limits of functions Exponential, logarithmic, and trigonometric functions. Differentiation. Complex numbers. Integration. Integrable functions. Extensions and applications of integration. Infinite series and infinite products. Partial differentiation. Multiple integration Sequences of functions. Functions of complex variables. Fourier series and integrals Differential equations. The gamma function and other definite integrals. Bibliography Index.

Note A textbook for students majoring in mathematics and for graduate students who desire more logical treatment of the subject than is feasible in first course. The Taylor series is studied at length and derived by the use of analytic functions, and an existence theorem for implicit functions is established in connection with partial differentiation. Elliptic integrals, Reimann integration of bounded functions, and the Stieltjes integral are also discussed.

GOLOMB, MICHAEL, AND MERRILL SHANKS

Elements of ordinary differential equations New York *McGraw Hill Book Company* Inc., 1950 356 p 24 cm. (International series in pure and applied mathematics William Ted Martin, consulting editor) $5 00 239

Contents Review and collection of formulas. Geometric fundamentals for first-order differential equations. Techniques for solving first-order equations applications. Second-order differential equations. Linear differential equations of higher order: constant coefficients. Algebra of inverse operators systems of linear differential equations. Linear equations with variable coefficients. Solution in power series some classical equations. Appendices. Bibliography Answers. Index.

Note An introductory textbook designed for use in courses offered to college students who have completed a course in elementary calculus. Special pedagogical features listed by the authors in the preface are early emphasis on geometric and numerical methods, use of the superposition principle, use of the existence theorems in development of techniques, elementary but mathematically sound development of operational calculus, systems of equations treated carefully without use of matrices, use of Green's functions and elementary but precise treatment of power series. The authors are members of the faculty of Purdue University

GRAVES, LAWRENCE M

The theory of functions of real variables Second edition New York McGraw Hill Book Company, Inc. 1956 375 p 23 cm. (International series in pure and applied mathematics, William Ted Martin, consulting editor) $7 50 240

Content Introduction. The real number system. Point sets. Functions and their limits properties of continuous functions. Fundamental theorems on differentiation The Riemann integral. Uniform convergence Functions defined implicitly Ordinary differential equations The Lebesgue integral. The Stieltjes integral. The theory of sets and transfinite numbers. Metric spaces. Index.

Note. A textbook designed as an introduction to the theory of functions of real variables. In addition to the customary introduction and treatment of this subject by development of the necessary principles of formal logic followed by study of function behavior some of the more general theorems on implicit functions, differential equations, and the Lebesgue and Stieltjes integrals also are included. The first edition was published in 1946. The major change in this second edition is the addition of the two terminal chapters. The chapters carried over have been revised to the extent that errors have been corrected, and some proofs have been simplified.

GRIFFITHS, LOIS WILFRED

Introduction to the theory of equations. Second edition. New York John Wiley & Sons, Inc. 1947 278 p illus 22 cm $4 00 241

Contents. Binomial equations. Cubic and quartic equations. General theorems on roots of polynomial equations Isolation and computation of real roots of real polynomial equations. Introduction to determinants. Determinants. Systems of linear equations and determinants. Complex numbers and the fundamental theorem of algebra. Symmetric functions. Bibliography Answers. Index.

Note. A textbook intended principally for college students who are planning to major in mathematics. Plane trigonometry plane analytic geometry and differential calculus are prerequisites. Inductive reasoning is used in the development of theorems for example, third, fourth and fifth order determinants are defined first, and in manner that clarifies the more complicated definition of the nth order which follows. Restatement is constantly used to help the student through *difficult proofs. De Moivre's* theorem, Sturm theorem, Descartes' rule, and Horner's method are discussed. The work was first published in 1945 under the title of *Determinants and systems of linear equations.*

HAHN, HANS, AND ARTHUR ROSENTHAL

Set functions Albuquerque The University of New Mexico Press 1948 324 p 26 cm $12 50 242

Content Introduction *Additive and totally* additive set functions. Measure. Measurable functions. Integration. Differentiation Bibliography (list of books quoted) List of symbols and signs. Index

Note. This book is based on the senior authors' two-volume work *Reelle Funktionen* (volume 1, Leipzig, *Akademische* Verlagsgesellschaft, 1932) The systematic manner of presentation and the inclusion of detailed proofs make the book of value as text to graduate students in mathematics. Bibliographies are given at the end of each main section.

Ives Howard Chapin

Natural trigonometric functions to seven decimal places for every ten seconds of arc, together with miscellaneous tables. Second edition. New York John Wiley & Sons Inc., 1942 351 p. 25 cm. $12.00 263

Contents: Table 1A, Tangents and cotangents from 0° to 3°. Table 1B, Sines, cosines, tangents and cotangents. Table 2 Length of arc to radius unity. Table 3, Coefficient K for central angles of certain curves. Table 4 Radii from arc definition. Table 5, Radii from chord definition. Table 6, Curves with even foot radii. Table 7 Functions of 1° curve. Table 8 Corrections to tangent distances. Table 9 Corrections to external distances. Table 10, Trigonometric functions: formulas and solution of triangles. Table 11 Minutes in decimals of a degree. Table 12, Units of length and of surface. Table 13, Secants and cosecants. Definitions and theory. Use of tables.

Note: Of value in engineering offices, particularly where calculating machines are used. The book gives tables of proportionate parts. The tables are printed on larger than usual pages and so arranged that reading them is made easy. In this edition, Part I has been expanded to include an entirely new table on the tangents and cotangents of 0° to 3°0' to single seconds. In addition, there is a table of sines, cosines, tangents and cotangents. Part II offers a variety of miscellaneous tables, information, and examples especially adapted to subdivision work.

Jackson Dunham

Fourier series and orthogonal polynomials. La Salle Ill. Open Court Publishing Company 1941 234 p. illus 19 cm. (The Carus mathematical monographs. No 6) $3.00 264

Contents: Fourier series. Legendre polynomials. Bessel functions. Boundary value problems. Double series—Laplace series. The Fourier frequency function. Orthogonal polynomials. Jacobi polynomials. Hermite polynomials. Laguerre polynomials. Convergence. Exercises. Bibliography. Index.

Note: Based on a course given by the author at the University of Minnesota. The treatment is for advanced mathematical students and other readers with a knowledge of calculus and familiarity with mathematical concepts.

John Fritz

Plane waves and spherical means applied to partial differential equations. New York Interscience Publishers Inc. 1955 172 p. illus. 24 cm (Interscience tracts in pure and applied mathematics edited by L. Bers and others) $4.50 265

Contents: Introduction. Decomposition of an arbitrary function into plane waves. The initial value problem for hyperbolic homogeneous equations with constant coefficients. The fundamental solution of a linear elliptic differential equation with analytic coefficients. Identities for spherical means. The theorems of Asgeirsson and Howard. Determination of a function from its integrals over spheres of fixed radius. Differentiability properties of solutions of elliptic systems. Regularity properties for integrals of solutions over time-like lines. Bibliography. Index.

Note: "This tract contains a somewhat heterogeneous collection of results on partial differential equations. The unifying element is the use of certain elementary identities for plane and spherical integrals of an arbitrary function. It is the aim of the author to show how a variety of results of fairly general differential equations follows from these identities."

Kaplan Wilfred

Advanced calculus. Reading, Mass. Addison-Wesley Publishing Company Inc., 1952 679 p. 24 cm. (Addison Wesley mathematics series Eric Reissner consulting editor) $9.00 266

Contents: Introduction. Vectors. Differential calculus of functions of several variables. Vector differential calculus. Integral calculus of functions of several variables. Vector integral calculus. Infinite series. Fourier series and orthogonal functions. Ordinary differential equations. Functions of a complex variable. Partial differential equations. Index.

Note: A college textbook for students who have completed courses in introductory algebra at the college level, analytic geometry and elementary calculus. Although fairly frequent discussions of applications—for instance the application of conformal mapping in hydrodynamics—indicate that the book is designed for engineering students rather than for mathematicians, the treatment is rigorous. Literature references accompany the chapters. The author is Associate Professor of Mathematics in the University of Michigan.

Kaplan, Wilfred, editor

Lectures on functions of a complex variable. Edited by Wilfred Kaplan with the assistance of Maxwell O Reade and Gail S Young. Ann Arbor University of Michigan Press 1955 435 p 24 cm. $10.00 267

Contents: Introductory topological analysis, by G. T. Whyburn. Potential theory and almost-complex manifolds, by D. C. Spencer. Remarks on Riemann surfaces, by L. V. Ahlfors. Univalent functions and linear differential equations, by Z. Nehari. Countability of Riemann surfaces, by R. Kuramochi. Polygonal representation of Riemann surfaces, by K. Kuratowski. Rings of analytic functions, by S. Kakutani. Topologies on the boundary and harmonic measure, by M. Brelot. Topology of R. S. Martin, and Green lines, by M. Brelot. Conjugate nets on an open Riemann surface, by J. Jenkins and M. Morse. The growth of entire and subharmonic functions, by W. K. Hayman. Uniformly normal families, by W. K. Hayman. Local theory of pseudoanalytic functions, by L. Bers. Functionals on Riemann surfaces, by L. Sario. Positive harmonic functions, by L. Sario. Distribution of zeros of polynomials, by P. C. Rosenbloom. Approximation by polynomials, by P. C. Rosenbloom and S. E. Warschawski. Boundary components of abstract Riemann surfaces, by M. Ohtsuka. Conformal deformation, by H. L. Royden. Functions in one complex variable as viewed from the theory of functions in several variables, by S. Bochner. Function-theoretic properties of certain elliptic systems of first-order linear equations, by A. Douglis. Modular functions defined by perturbation mappings, by H. Cohn. Holomorphic continuation of the kernel function and the Bergman metric in several complex variables, by H. J. Bremermann. Regularity criteria in potential theory, by J. L. Ullman. Analytic functions of class H_p, by W. Rudin. Applications of normed linear spaces to function-theoretic extremal problems, by H. S. Shapiro. A topological problem originating in the theory of Riemann surfaces, by W. Rosen. Expansion theorems for analytic functions, by R. C. Buck. Entire functions as limits of polynomials, by J. Korevaar. Curve families and Riemann surfaces, by W. Kaplan. The image of the boundary under a local homeomorphism, by C. J. Titus.

Note: Papers presented at the Conference on Functions of a Complex Variable, held at the University of Michigan, June 17 July 1 1953 are published in this volume. The authors are among the leading mathematicians of the world, and they addressed themselves to graduate mathematicians. In many instances, the results of recent research and study were reported. The wide range of topics covered is obvious from the chapter titles. Some lectures given at the Conference are not printed in the volume because arrangements had been made to publish them elsewhere. The authors and titles of these are listed in the volume's foreword.

Kellogg, Oliver Dimon

Foundations of potential theory. With 30 figures. New York Dover Publications Inc., 1953 384 p. illus. 21 cm. $1.98 268

Contents: The force of gravity. Fields of force. The potential. The divergence theorem. Properties of Newtonian potentials at points of free space—at points occupied by masses. Potentials as solutions of Laplace's equation; electrostatics. Harmonic functions. Electric images; Green's function. Sequences of harmonic functions. Fundamental existence theorems. The logarithmic potential. Bibliographical notes. Index.

Note: A standard systematic account of potential functions. The first three chapters are relatively elementary and are designed for students and other readers making their first study of the subject. The other chapters are more advanced and are mathematically rigorous. The two chapters at the end of the book constitute a critical historical account of the many attempts to prove the fundamental existence theorem. The book was first published in 1929. This edition is an unaltered and unabridged reprint.

Note The above entries represent the complete set of these notable tables of Bessel functions of the first kind. The computations were made on Harvard University's Automatic Sequence Controlled Calculator under contract with the United States Navy For orders zero to three, the calculations are carried to 18 decimal places, and for the other orders to 10 decimal places, with wide range of argument and order five-argument intervals, and a high degree of accuracy previously unobtainable. The tables are reproduced by offset lithography directly from pages typed by typewriters controlled by the calculating machine, thus avoiding errors that might occur in typesetting. Methods of computation are described and directions for interpolating are given in the first volume of the series.

HARVARD UNIVERSITY COMPUTATION LABORATORY

Tables of the function arc sin Z By the staff of the Computation Laboratory Cambridge, Mass Harvard University Press 1956 586 p 27 cm (Harvard University Computation Laboratory Annals Vol. XL) $12 50 257

Contents: The inverse trigonometric and hyperbolic functions in the complex domain. Composition of the tables. Interpolation in the tables. Tables of the function arc sin Z.

Note: The tables published in this volume were computed on Harvard University's Mark IV calculator at the request of the Aeronautical Research Laboratory of the United States Air Force. Both the argument and the function are given in Cartesian form, and the computation is to six decimal places. Pseudo-differences (or alternative methods) are given so as to provide interpolation to within an error of 2×10^{-6} by second order interpolation. The prefatory material includes description of the properties of the trigonometric and hyperbolic functions in the complex domain, discussion of the arrangement and the method of computation of the tables, and a discussion of interpolation methods applicable to the tables, all written by Theodore Singer

HARVARD UNIVERSITY COMPUTATION LABORATORY

Tables of inverse hyperbolic functions By the staff of the Computation Laboratory Cambridge, Mass. Harvard University Press 1949 290 p 27 cm. (Harvard University Computation Laboratory Annals Vol. XX) $8 00 258

Contents Introduction Contents of the tables. Computation of the tables. Interpolation in the tables. Bibliography of tables of inverse hyperbolic functions Table I The inverse hyperbolic tangent $\tanh^{-1}$ for $0 \leq \ < 1$ Table II The inverse hyperbolic sine $\sinh^{-1} x$ for $0 \leq x < 3.5$ Table III The inverse hyperbolic cosine $\cosh^{-1}$ for $1 \leq \ < 3.5$ Table IV The inverse hyperbolic sine and cosine $\sinh^{-1} x$, $\cosh^{-1} x$ for $3.5 \leq x \leq 22{,}980$.

Note The tables in this volume were calculated on the Automatic Sequence Controlled Calculator at Harvard University and are tabulated to nine decimal places with possible error in the ninth place of not more than 0.6 unit.

HARVARD UNIVERSITY COMPUTATION LABORATORY

Tables of the modified Hankel functions of order one-third and of their derivatives Cambridge, Mass Harvard University Press 1945 235 p. illus. 27 cm (Harvard University Computation Laboratory Annals Vol. II) $8 00 259

Contents Introduction Part I, The modified Hankel functions and their properties. Part II, The method of computation of the functions. Bibliography Tables The coefficients of the Maclaurin's series for $f(z)$, $g(z)$ $f'(z)$, and $g'(z)$. The coefficients in the asymptotic series for $h_1(z)$ and $h_2(z)$. Useful constants. The zeros of $h_1(z)$ and $h_1'(z)$. The functions $h(z)$ and $h_1(z)$ for $\Delta x = \Delta y = 0.1$ and $| \ + iy| \leq 6$. The functions $h(z)$ and $h_1'(z)$ for $\Delta x = \Delta y = 0.1$ and $| \ + iy| \leq 6$.

Note A book of mathematical tables for use and convenience in the solution of Stokes' equation in the complex plane. A form of differential equation used in describing simple cases of wave refraction and diffraction. The work was sponsored by the Bureau of Ships of the U S. Navy and was accomplished during World War II on the I B. M. automatic sequence controlled calculator belonging to Harvard University

HIRSCHMAN, I I, AND D V WIDDER

The convolution transform. Princeton Princeton University Press, 1955 268 p 24 cm. (Princeton mathematical series, editors Marston Morse and A W Tucker) $5 50 260

Contents Introduction. The finite kernels. The non-finite kernels. Variation diminishing transforms. Asymptotic behavior of kernels. Real inversion theory. Representation theory The Weierstrass transform. Complex inversion theory Miscellaneous topics. Bibliography Symbols and notations. Index.

Note. An important contribution to mathematical analysis. It presents general theory designed to unify the study of integral transforms. The authors state, most of the classical integral transforms involve integrals which define convolutions. For the present authors the convolution transform came as a natural generalization of the Laplace transform. It was early recognized that the now familiar real inversion of the latter is essentially accomplished by a particular differential operator of infinite order (in which translations are allowed) This relation between differential operators and integral transforms is the basic theme of the present study The book is addressed to graduate mathematicians possessing a knowledge of real and complex variable theory

HOLMES, CECIL THOMAS

Calculus and analytic geometry New York McGraw Hill Book Company, Inc., 1950 416 p illus 24 cm. $6 75 261

Contents Algebra and geometry in cooperation Elements of the differential calculus. The conic sections. Maxima, minima, and inflections. First notions of the integral calculus. Algebraic functions. Curvilinear motion—vectors—parametric equations—arc length—area of a surface of revolution. The logarithmic and the exponential functions—integration by parts. The trigonometric functions. Calculus with the trigonometric functions—applications. Infinite series—expansion of functions. Ordinary differential equations Solid analytic geometry Differential calculus for functions of more than one variable. Integral calculus with functions of more than one variable. Formulas for reference. Answers to exercises. Index.

Note An introductory textbook developed at Bowdoin College, where the author is Professor of Mathematics. It is organized so that the student who stays with the course only through the fifth chapter will have been presented with a survey of the main concepts and techniques of plane geometry and of calculus, while the student who takes the whole course will in addition acquire considerable practice in the use of the calculus. Most theorems are proved.

HUNTINGTON EDWARD V

The continuum and other types of serial order, with an introduction to Cantor's *Transfinite numbers* Second edition. New York Dover Publications Inc. 1955 82 p illus. 20 cm $1 00 262

Contents Introduction. On classes in general. On simply ordered classes, or series. Discrete series—especially the type ω of the natural numbers. Dense series—especially the type η of the rational numbers. Continuous series—especially the type θ of the real numbers. Continuous series of more than one dimension, with note on multiply ordered classes. Well-ordered series, with an introduction to Cantor Transfinite numbers. Index of technical terms.

Note A reprint without textual changes of book published by Harvard University Press in 1917 Its original purpose was to give systematic elementary account of the modern theory of the continuum as type of serial order and it still has value for those students and graduate mathematicians who are interested in series, irrational numbers, the real number system of algebra, and mathematical logic.

and numerous small revisions have been made in chapters carried over from the preceding edition. Professor Reinville, who revised the book for the fifth edition, is Professor of Mathematics in the University of Michigan.

LOVITT, WILLIAM VERNON

Linear integral equations. New York Dover Publications Inc., 1950. 253 p. illus. 21 cm. $1.60 276

Contents: Introductory. Solution of integral equation of second kind by successive substitutions. Solution of Fredholm's equation expressed as ratio of two integral series in λ. Applications of the Fredholm's theory. Free vibrations of an elastic string. Constrained [illegible] of an elastic string. Auxiliary theorems on harmonic functions. Logarithmic potential of a double layer. Fredholm's solution of Dirichlet problem. Logarithmic potential of a simple layer. Fredholm's solution of Neumann's problem. Hilbert-Schmidt theory of integral equations with symmetric kernels. Solution expressed in terms of a set of fundamental functions. Existence of at least one characteristic constant. Orthogonality. Auxiliary theorems. Solution of the integral equation. Applications of the Hilbert-Schmidt theory. Boundary problems for ordinary linear differential equations. Applications to some problems of the calculus of variations. Vibration problems. Applications of the Hilbert-Schmidt theory to the flow of heat in a bar. Index.

Note: A reprint without textual changes of a book first published in New York in 1924. It is devoted entirely to the general theory of linear equations with a single integration. Applications to physics are illustrated, but the primary emphasis is on the mathematical theory.

MACDUFFEE, CYRUS COLTON

Theory of equations. New York John Wiley & Sons Inc., 1954 120 p illus. 24 cm. $3 75 277

Contents: Linear systems. Rational solutions. Polynomials. Real roots. Complex roots. Relations among the roots. Systems of higher degree. Answers to exercises. Index.

Note: A relatively brief text designed for short, introductory courses. There is some bias towards the needs of students who are preparing for scientific careers in such fields as physics, chemistry, and agriculture. The theory of polynomials is emphasized. A feature of particular value to readers who attempt the study of the subject by themselves or use the book for review is the inclusion of many examples of computations. The author is Chairman of the Department of Mathematics of the University of Wisconsin.

MCKELVEY JOSEPH VANCE

Calculus Revised edition. New York The Macmillan Company 1951 405 p. illus. 22 cm. $5.25 278

Contents (abridged): Differential calculus: Functions. Limits and continuity. Increments—derivatives. Differentiation of algebraic functions. Transcendental functions. Differentials. Parametric equations. Rolle's theorem—mean value theorem—indeterminate forms. Functions of more than one variable. Curvature. Singular points. Integral calculus: Integration by parts—substitutions—rational fractions. The definite integral. Length of arc—area of surface of revolution. Improper integrals. Multiple integrals. Fluid pressure—moments—work. Infinite series. Differential equations. Theory of limits—continuity. Answers to exercises. Table of integrals. Index.

Note: An established introductory text in which the author has followed the pedagogical principle of illustrating new ideas first and giving definitions, terminology and theorems afterwards. The present edition represents a moderate amount of revision with one newly added chapter, many new problems, and numerous minor changes. The author is Professor of Mathematics in Iowa State College.

MCSHANE, EDWARD JAMES

Integration. Princeton Princeton University Press, 1944 394 p. illus. 23 cm. (Princeton mathematical series editors Marston Morse and A. W Tucker) $2 95 279

Contents: Some theorems on real-valued functions. The Lebesgue integral. Measurable sets and measurable functions. The integral as a function of sets, convergence theorems. Differentiability. Continuity properties of measurable functions. The Lebesgue-Stieltjes integral. The Perron integral. Differential equations. Differentiation of multiple integrals. Appendix. Index.

Note: This book was written to introduce beginning graduate students of mathematics to the theory of integration. The method of development of the theory is a modification of that devised by Daniell, the Lebesgue integral appearing as the result of two-stage extension of the classical integral of a continuous function. The proofs are so arranged that the Lebesgue-Stieltjes integral is obtained with little additional discussion. The Perron integral is also studied. Ordinary differential equations are treated in considerable detail, in order that the theorems obtained will be suited to the needs of the calculus of variations.

MCSHANE EDWARD JAMES

Order-preserving maps and integration processes. Princeton Princeton University Press 1953 136 p. 25 cm. (Annals of mathematics studies. No. 31) $2 75 280

Contents: Introduction. Partially ordered sets and systems. Definition of the mapping. Lattice properties, convergence and measurability. Algebraic operations. Real-valued functions. Applications. Bibliography.

Note: An advanced study for mathematicians interested in algebra and calculus and concerned with the Lebesgue integral and Daniell development of the integral. It is devoted to the problem set out as follows. "We are given two partially ordered sets F and G, and an order-preserving mapping L of a subset E of F into G. We seek conditions on E, L, F and G that will enable us to extend the domain of definition of L, producing say a mapping I of F into G, in such a way that the enlarged domain F shall have some useful closure properties and the extended mapping I shall have some useful kind of continuity property on its domain." The study is an exploitation of the order properties almost exclusively; consequently the territory covered differs in part from that covered by the integration theories based largely on norms.

MARDEN MORRIS

The geometry of the zeros of a polynomial in a complex variable New York American Mathematical Society 1949 183 p. 26 cm. (American Mathematical Society Mathematical surveys. No III) $5.00 281

Contents: Introduction. The critical points of a polynomial and some of their generalizations. Involutions. [illegible] Composite polynomials. The critical points of a rational function which has its zeros and poles in prescribed circular regions. The critical points of a polynomial which has only some prescribed zeros. Bounds for the zeros as functions of all coefficients. Bounds for p zeros as functions of p + 1 coefficients. The number of zeros in a half-plane or sector. The number of zeros in a given circle. Bibliography. Index.

Note: The problems treated here center about the study of the zeros of a polynomial as functions of various parameters, usually the coefficients of the polynomial. The first contributors to this subject were Gauss and Cauchy. This survey is a detailed exposition bringing together, unifying, and simplifying the many results at present scattered throughout the mathematical journals.

MARTIN WILLIAM TED AND ERIC REISSNER

Elementary differential equations. Reading Mass. Addison Wesley Publishing Company Inc., 1956 260 p. illus. 24 cm. (Addison Wesley mathematics series Eric Reissner consulting editor) $5.50. 282

Contents: Nature and origin of differential equations. The differential equation of first order. Second order differential equations. Higher order differential equations. Systems of first order differential equations. Approximate solution of first order differential equations and Picard' theorem. Finite difference equations. Partial differential equations. Answers. Index.

Note: A well-organized text, written by two members of the faculty of Massachusetts Institute of Technology. Although biased toward the interests of students preparing for careers in engineering or some field of science other than mathematics, the bias is manifested chiefly in the book's wide scope and in the exercises included for the reader.

KELLS, LYMAN M , AND OTHERS

Plane and spherical trigonometry Third edition. By Lyman M Kells, Willis F Kern and James R Bland. New York McGraw Hill Book Company, Inc , 1951 290 p illus. 23 cm $4 50 269

Contents Plane trigonometry Trigonometric functions of an acute angle. Fundamental relations among the trigonometric functions. The right triangle. Generalized trigonometric functions. Vectors. Graphs of trigonometric functions. General formulas. Oblique triangles. Inverse functions and trigonometric equations. Complex numbers. Logarithms. Spherical trigonometry Basic ideas and formulas of spherical trigonometry Solution of spherical triangles by computation. Applications relating to celestial bodies and the astronomical triangle. Classical methods of solving spherical triangles. Appendixes. Index. Answers.

Note The authors of this text are all present or former members of the faculty of the United States Naval Academy As would be expected, applications of plane and spherical trigonometry in navigation and other phases of naval science figure largely in the exercises and are occasionally mentioned in the expository text. However the book's purpose is to teach trigonometry rather than navigation The fundamentals of the subject are well covered, and the material is logically organized. The first edition was published in 1935 and the second edition in 1940. The third edition is the result of rather extensive revision. Features include new problems, numerous examples of concise forms of computation in addition to traditional forms, a short chapter on vectors, etc. The type was reset, and the book has a new format.

LASS, HARRY

Vector and tensor analysis New York McGraw Hill Book Company, Inc 1950 347 p 24 cm (International series in pure and applied mathematics William T Martin, consulting editor) $6 50 270

Contents. The algebra of vectors. Differential vector calculus. Differential geometry Integration. Static and dynamic electricity Mechanics. Hydrodynamics and elasticity Tensor analysis and Riemannian geometry Further applications of tensor analysis. References. Index.

Note An introductory textbook in which considerable attention is given to indicating the applications of vector and tensor analysis Numerous fully worked examples form part of the exposition. The applications discussed in the final chapter include Einstein's law of gravitation.

LEFSCHETZ, SOLOMON, editor

Contributions to the theory of nonlinear oscillations Volume I Princeton Princeton University Press, 1950 350 p illus. 26 cm (Annals of mathematics studies Emil Artin and Marston Morse editors No 20) $4 00 271

Contents On systems of ordinary differential equations, by S. P Diliberto. Oscillation of third order nonlinear autonomous system, by L. L. Rauch. Nonlinear difference-differential equations, by F H. Brownell. Forced oscillations in nonlinear systems, by M L Cartwright. Singular perturbations of Van der Pol equation, by J G Wendel The existence of forced periodic solutions of second order differential equations near certain equilibrium points of the unforced equation, by C. E. Langenhop and A B Farnell. The construction of periodic solutions of singular perturbation problems, by W Wasow

—— Volume II Princeton Princeton University Press 1952 122 p 26 cm (Annals of mathematics studies, Emil Artin and Marston Morse, editors. No 29) $1 50 272

Contents Van der Pol's equation for relaxation oscillations, by M. L. Cartwright. Perturbations of linear systems with constant coefficients possessing periodic solutions, by E. A. Nonlinear differential equations systems, by E. Pinney On a nonlinear differential equation containing a small parameter by V B. Haas Critical points at infinity and forced oscillation, by R. E. Gomory On certain critical points of differential system in the plane, by S. Barocio. On the total number of singular points and limit cycles of differential equation, by F Haas. Banach spaces and the perturbation of ordinary differential equations, by G. Hufford. A fixed point theorem by W T Kyner Perturbation theorems for nonlinear ordinary differential equations, by S. P Diliberto and G. Hufford. A note on the existence of periodic solutions of differential equations, by S. P Diliberto and M. D. Marcus. An invariant surface theorem for nondegenerate system, by M. D Marcus. An application of periodic surfaces (solution of a small divisor problem) by S. P Diliberto. Repeating solutions for degenerate system, by M. D Marcus. Bounds for periods of periodic solutions, by S. P Diliberto. One-dimensional repeating curves in the nondegenerate case, by P Kenoh.

Note Three collections of original papers bearing on the mathematical analysis of nonlinear oscillations. Many of the papers have engineering as well as mathematical interest.

LEHMANN, CHARLES H

Analytic geometry New York John Wiley & Sons, Inc., 1942 425 p illus 23 cm $4 75 274

Contents. Plane analytic geometry: The point in the plane. Equation and locus. The straight line. The circle. Transformation of coordinates. The parabola. The ellipse. The hyperbola. The general equation of the second degree. Polar coordinates. Parametric equations. Higher plane curves. Solid analytic geometry The point in space. The plane. The straight line in space. Surfaces. Curves in space. Appendixes. Answers to exercises. Index.

Note A first course in plane and solid analytic geometry for college students. It assumes on the part of the student only the usual preliminary preparation in elementary geometry plane trigonometry and the essential parts of college algebra. The work is longer than the usual textbook in this field, and the emphasis is upon the acquiring of a sound knowledge of analytic methods rather than upon the geometric facts alone.

LOVE, CLYDE E , AND EARL D RAINVILLE

Differential and integral calculus Fifth edition New York The Macmillan Company 1954 526 p illus 24 cm. $4 00 275

Contents Functions, limits, continuity The derivative slope rate of change. Algebraic functions. Applications of the derivative. The differential. Integration. Discontinuities. Trigonometric functions. Inverse trigonometric functions Exponential and logarithmic functions. Hyperbolic functions. Curvature. Indeterminate forms. Curve tracing. Solution of equations—Newton's method. Fundamental integration formulas. Integration by substitution. Integration of rational fractions. Definite integrals Wallis' formula. Plane areas Improper integrals. Applications of integration. Centroids. Moments of inertia. Fluid pressure work. Series of constant terms. Power series. Operations with power series. Approximate integration. Partial differentiation. Double integrals. Triple integrals. Differential equations of the first order Linear differential equations. Rectilinear motion. Appendixes Definition of limit. Proof of theorem on limits. Tables. Index.

Note. The first edition of this college text was published in 1916 and the fourth edition in 1943. Integration is introduced early in the book, an arrangement that is now common to several successful textbooks in calculus. The treatment is introductory with no particular bias either towards the needs of students who are preparing for further work in mathematics or those who are preparing for science and engineering. An outstanding feature is the number and range of exercises included for the student to solve. In this fifth edition, there are about 3 900 exercises, of which the majority are new Aside from the exercises, there has been some reorganization,

Note: Designed for students [illegible] mathematical preparation for the course does not go beyond introductory calculus, this book offers an elementary but [illegible] mathematically rigorous view of ordinary and partial differential equations. Many of the problems, including those solved in the text as part of the exposition, illustrate applications in engineering. It was first published in 1933 and the second edition was published in 1941.

MORSE, MARSTON

The calculus of variations in the large New York The American Mathematical Society 1934 368 p 16 cm. (American Mathematical Society Colloquium publications. Vol. XVIII) $5.35 291

Contents: The fixed end point problem in non-parametric form. General end conditions. The index form. Self-adjoint systems. The functional on [illegible] Riemannian space. The critical sets of functions. The boundary problem in the large. Closed extremals. Solution of the Poincaré continuation problem. Bibliography. Index.

Note: The background for the theory in this volume lies in two rather distinct fields of mathematics. W[illegible] have on the one hand the theory of critical points of functions of [illegible] real variables. In the author's earlier papers he established [illegible] simple set of relations between the numbers of critical points of various types and the connectivity numbers of the domain over which the function ranges. On the other hand we have the calculus of variations and its modern treatment as [illegible] part of the functional calculus. The calculus of variations in the large derives its interest in large part from the fact that it undertakes [illegible] study of the [illegible] to which [illegible] calculus of variations gives rise, namely the extremals, with respect to important properties apart from the question of whether or not they furnish extrema [illegible] integral. In classical calculus of variations only such arcs AB are considered which contain no point A' conjugate to A. The theory of this book reveals the importance of extremal arcs AB upon which there may be one or more points conjugate to A.

MORSE, MARSTON

Topological methods in the theory of functions of a complex variable. Princeton Princeton University Press, 1947 145 p. illus. 23 cm. (Annals of mathematics studies. No 15) $2.25 292

Contents: Pseudo-harmonic functions. Differentiable boundary values. Interior transformations. The general order theorem. Deformations of locally simple curves and of interior transformations.

Note. This volume contains the revised form of [illegible] set of mathematical lectures delivered at Princeton University in 1945. The material is based mainly on joint research by the author and Dr Maurice Heins. The advantages of geometric methods as [illegible] complements of other methods used in dealing with function theory are emphasized. The work is intended for graduate students in mathematics and for mathematicians.

MUNROE, M E.

Introduction to measure and integration. Reading, Mass. Addison-Wesley Publishing Company Inc., 1953 310 p. illus. 21 cm. (Addison-Wesley mathematics series Eric Reissner consulting editor) $8.50. 293

Contents: Point set theory. Measure—general theory—specific examples. Measurable functions. Integration. Convergence theorems. Differentiation. Bibliography. Index of postulates. Index of symbols. Index.

Note: An introductory textbook in measure theory addressed primarily to graduate students of mathematics. A few applications of measure theory to other mathematical concepts and techniques, such as Hausdorff measures, Banach spaces, and stochastic variables, are pointed out, but otherwise the book is limited to theory. Sections [illegible] which applications are discussed are distinguished with asterisks to enable the reader who is interested in theory only to skip them. Exercises designed as an integral part of the exposition are included. The book was developed in [illegible] courses given by the author at the University of Illinois.

MURRAY, FRANCIS J., AND KENNETH S MILLER

Existence theorems for ordinary differential equations New York New York University Press, 1954 154 p. 23 cm. $5.00. 294

Contents: Introduction. The fundamental existence theorem. General existence theorems. Uniqueness theorems. The Picard iterants. Properties of solutions. Linear differential equations. Index.

Note: A unified treatment of classical existence and uniqueness theorems and theorems concerning parameters. The material has been selected and the book published because of the availability of electronic differential analyzers [illegible] which greatly facilitate the techniques of mathematical analysis. The authors state, "It is believed that the mathematical theories here presented will continue to be of importance. [illegible] When analogue devices are used without [illegible] proper mathematical basis, the user appears to be groping in the dark and indeed much of the 'experience' acquired under these circumstances has precisely the unpleasant character associated with bumping one's shins on an unseen obstacle. The mathematical basis is precisely the illumination needed to map out the general situation."

NATHAN, DAVID SOLOMON AND OLAF HELMER

Analytic geometry New York Prentice-Hall Inc., 1947 402 p. illus. 24 cm. (Prentice-Hall mathematics series Albert A. Bennett editor) $4 75 295

Contents: Coordinates on [illegible] line. Rectangular coordinates in the plane. Angles. Loci. Lines. Circles. Coordinate transformations. Conic sections. Conic sections in arbitrary position. Higher plane curves. Families of curves. Parametric representation. Polar coordinates. Fitting of empirical data. Rectangular coordinates in space. Loci in space. Planes and lines. Formulas and tables for reference. Answers. Index.

Note: An introductory text designed for college students having background knowledge of [illegible] and elementary geometry. The authors have made [illegible] special effort to develop fully one idea at a time, and have organized their material around the themes of equations of loci and loci of equations. Each chapter includes [illegible] brief summary and numerous review problems, many of [illegible] which illustrate the application of analytic geometry to the solution of problems in the engineering and physical sciences.

NEHARI, ZEEV

Conformal mapping. New York McGraw Hill Book Company Inc., 1952 396 p. illus. 23 cm. (International series in pure and applied mathematics William Ted Martin consulting editor) $8.00 296

Contents: Harmonic functions. Analytic functions. The complex integral calculus. Families of analytic functions. Conformal mapping of simply-connected domains. Mapping properties of special functions. Conformal mapping of multiply-connected domains. Index.

Note: A graduate-level textbook addressed to students [illegible] knowledge of advanced calculus. The first four chapters cover the ground sometimes covered in introductory courses on functions of [illegible] complex variable. The remaining three chapters deal primarily with applications in the conformal mapping of [illegible] variety of geometric figures. Two of the chapters are of special interest aside from their textbook use, the one on mapping properties of special functions because of its scope and usefulness in applied mathematics, and that on the conformal mapping of multiply-connected domains because of the inclusion of topics not previously published in book form.

NELSON ALFRED L., AND KARL W FOLLEY

Plane trigonometry Third edition. New York Harper & Brothers, 1956 195 135 p. illus. 23 cm. (Harper's mathematics series Charles A. Hutchinson, editor) $3.50 297

Contents: Trigonometric functions of the general angle. Trigonometric functions of positive acute angles. Reduction formulas. Logarithms. Solution of triangles. Graphs of trigonometric functions. Trigonometric functions of any angles. Inverse trigonometric

MAY, KENNETH OWNSWORTH

Elementary analysis New York John Wiley & Sons, Inc., 1952 635 p illus. 22 cm. $5 00 *283*

Contents. Introduction. Logic. Numbers and elementary operations. Linear functions. The quadratic function. The power functions. The exponential and logarithmic functions. Circular functions. Analytic geometry The complex number system. Conic sections. Polynomials. Algebraic functions. Functions of two variables. Tables. Index.

Note An introductory textbook for beginning college students. It provides a unified treatment of concepts and techniques from logic, number theory algebra, analytic geometry trigonometry and introductory calculus. It is characterized by patient and clear explanations. The author is Chairman of the Department of Mathematics in Carleton College.

MENGER, KARL

Calculus, a modern approach. Boston Ginn and Company, 1955 354 p illus. 23 cm $5.25 284

Contents: The two basic problems of calculus and their solutions for straight lines. Graphical solutions of the two basic problems. Numerical solutions of the two basic problems. The idea and the use of functions. On limits. The basic concepts of calculus. The application of calculus to science. The calculus of derivatives. The calculus of antiderivatives. The mean value theorem and its consequences. Two-place functions. Appendix. Bibliography Topical index. Index of symbols.

Note The organization of this introductory textbook is unusual, as the chapter titles listed above indicate. Its contents are also unconventional. They are the result of a planned effort to simplify and clarify the teaching of calculus by eliminating conceptual obscurities. Furthermore the exposition is so explicit and detailed that the book is almost self-teaching. It was developed in evening courses given by the author at the Illinois Institute of Technology. The courses were offered to engineers and others who worked during the day in scientific and technical occupations consequently the book has a definite practical bias. Nevertheless, the mathematics is not skimped. Basic concepts, symbols and manipulations are all explained with great care. Improvements in notation and a "new theory of variable quantities" make the book of interest to teachers of mathematics and other graduate mathematicians as well as to students.

MIDDLEMISS, ROSS RAYMOND

Analytic geometry Second edition New York McGraw Hill Book Company, Inc. 1955 310 p 23 cm $4 25 285

Contents Introduction Review of essential definitions and formulas from algebra and trigonometry Plane analytic geometry: Rectangular coordinates, fundamental definitions and theorems. Functions and graphs. Equation of a locus. The line. Polynomials. Rational fractional functions. Transformation of coordinates. The circle. The parabola, ellipse and hyperbola. Algebraic curves of higher degree. The trigonometric curves. The exponential and logarithmic curves. Parametric equations. Polar coordinates. Curve fitting Solid analytic geometry: Preliminary definitions and formulas. Planes and lines. Surfaces and curves. Numerical tables. Answers. Index.

Note A textbook designed for the college students of science or engineering who will later take a course in calculus.

MIDDLEMISS, ROSS RAYMOND

Differential and integral calculus. Second edition New York McGraw Hill Book Company, Inc. 1946 497 p illus. 23 cm. $5 25 *286*

Content (abridged) Functions and their graphs. The limit of function. The derivative. Differentiation of algebraic functions. The second derivative. The trigonometric functions. The exponential and logarithmic functions Derivative f arc—curvature. Parametric equations. The differential. Integration. Trigonometric integrals. The definite integral. Approximate integration. First moment—centroid. Second moment—radius f gyration. Solid analytic geometry Partial derivatives. Multiple integrals. Infinite series. Differential equations. Table of integrals. Numerical tables. Index.

Note. An introduction for college students. The plan of the first edition has been retained, but many sections and several entire chapters have been rewritten. Among the revised chapters are those on multiple integrals and partial derivatives. The chapter on solid geometry has been added, and the problems in the first edition have been largely replaced with new ones.

MILLER, FREDERIC HOWELL

Analytic geometry and calculus, a unified treatment. New York John Wiley & Sons Inc, 1949 658 p illus. 22 cm $5 50 287

Contents Functional relations and loci. The straight line. Limits and the derivative concept. Differentiation of algebraic functions. The integral concept. Elementary applications of calculus. The circle. Coordinate transformations. The conic sections. Differentiation of transcendental functions. Integration processes. Parametric equations. Further applications of differential calculus. Further applications of integral calculus. Polar coordinates. Points, planes, and lines in space. Surfaces and curves in space. Partial differentiation. Multiple integrals. Infinite series. Appendixes. Answers to odd-numbered exercises. Index.

Note A distinctive feature of this college text is its integration of plane and solid analytic geometry with differential and integral calculus. The unified presentation is thought to have definite advantages over the study of analytic geometry and calculus as separate branches of mathematics. Numerous illustrative examples are worked out as part of the exposition. There are about 1,000 exercises for the student, and a fair number of these illustrate applications to physics or engineering. The author is Professor of Mathematics in the Cooper Union School of Engineering.

MILLER, FREDERIC HOWELL

Partial differential equations New York John Wiley and Sons, Inc., 1941 259 p illus. 23 cm $4 50 288

Contents (abridged) Ordinary differential equations. Partial differentiation and space geometry Origins f partial differential equations. Linear equations of first order. Non-linear equations of first order. Fourier series. Linear equations of second and higher orders. Non-linear equations of second order Answers to exercises. Index.

Note. Planned to fill the need of students of analysis, geometry and the physical sciences for an adequate treatment of partial differential equations similar to the usual course in ordinary differential equations.

MORRILL, WILLIAM K

Calculus Princeton D Van Nostrand Company, Inc. 1956 537 p. illus 23 cm $6 00 *289*

Contents Introduction. Variable, function infinitesimal or null. Limits, continuity and differentiability Formulas of differentiation. Maximum and minimum. Inverse functions. Differentiation of transcendental functions. Mean value theorem of differential calculus. Antidifferentiation. Further applications of the derivative. The definite integral. Methods of integration. Geometric applications of the definite integral. Physical applications of the integral. Infinite sequences and series. Functions of several variables. Geometric applications. Multiple integrals. Differential equations. Appendix. Answers. Index.

Note A rigorous and comprehensive introduction to calculus developed in course at the Johns Hopkins University One of its special pedagogical features is the early introduction of infinitesimal or null functions. Applications of calculus to the analysis of problems in science and engineering are illustrated both in the worked examples which are part of the expository text and in the problems included for students to solve.

MORRIS, MAX, AND ORLEY E BROWN

Differential equations. Third edition. Englewood Cliffs N J Prentice Hall Inc. *1952* 341 p *22* cm $6 00 *290*

Contents Introduction. Differential equations of the first order and first degree. Equations of the first order, but not of the first degree. Linear differential equations. Numerical approximation to solutions. Integration in series. Ordinary differential equations in more than two variables. Partial differential equations of the first order Linear partial differential equations with constant coefficients. Partial differential equations of order two. Table of integrals. Table of natural logarithms. Answers to exercises. Index.

Note A textbook designed for use in full-length, introductory courses in differential equations. Because particular attention is paid to methods of solving differential equations, it is especially suitable for students majoring in science or in engineering. However, direct applications to problems in physics and engineering are concentrated in two chapters. The first 13 chapters are reprints of the material published in the author's *Short course in differential equations*, New York, 1949 210 p., $3.00.

RAINVILLE, EARL DAVID

Intermediate course in differential equations. New York John Wiley & Sons, Inc., 1943 213 p. 21 cm. $5.25 304

Contents Linear equations of the second order. Riccati equations. Preliminary material on complex variables. Solution in series. Equations of Fuchsian type. The hypergeometric equation. Confluence of singularities. Whittaker's confluent hypergeometric equation. Some classical equations. Applications. Index.

Note This textbook for advanced students of mathematics, chemistry and physics is intended to bridge the gap between elementary courses and really advanced courses, and attempts to furnish the student with further tools for constructing computable solutions for specific differential equations, in particular for linear equations in the neighborhood of regular singular points. A knowledge of advanced calculus is assumed.

RANDOLPH, JOHN ADAM FITZ, AND MARK KAC

Analytic geometry and calculus. New York The Macmillan Company 1946 642 p. illus. 24 cm. $7.50. 305

Contents Coordinate systems. Functions, limits, derivatives. Derivatives and derivative systems. Applications of derivatives. Differentials, increments, and approximations. Definite integrals. Analytic geometry complemented by calculus. Trigonometric and inverse trigonometric functions. Logarithmic and exponential functions. Indefinite integration. Further applications of definite integrals. Applications of definite integrals. Parametric equations, curvature, polar coordinates. Law of the mean, Taylor's theorem, evaluation of limits. Solid analytic geometry and partial derivatives. Multiple integrals. Table of integrals. Selected answers to problems. Index.

Note By emphasizing graphs, the authors of this work have welded calculus and analytic geometry in a way that demonstrates the fundamental concepts of each and the complementary relationships between them. The book is designed as a college textbook. Its text is arranged so that it may be used either in a survey course or a thorough course. A generous number of examples and problems is furnished.

RANDOLPH JOHN ADAM FITZ

Calculus. New York The Macmillan Company 1952 483 p. 24 cm. $6.00. 306

Contents Functions, limits, derivatives. The definite integral. Applications of derivatives. Transcendental functions. Indefinite integration. Solid geometry. Partial derivatives. Multiple integrals. Further applications. Approximations. Series. Appendix. Table of integrals. Answers. Index.

Note An introductory college textbook with several interesting pedagogical features. The author believes in the gradual introduction of important concepts and techniques; hence, the exposition of ideas new to the student is usually foreshadowed by the introduction of material that demonstrates the necessity for it. The direct connection between analytic geometry and calculus is shown in the first part. The derivatives of sine and cosine functions are introduced early and definite integrals are taken up before indefinite integrals. The author is Chairman of the Department of Mathematics at the University of Rochester.

REDDICK, HARRY W AND DONALD E KIBBEY

Differential equations. Third edition. New York John Wiley & Sons, Inc. 1956 304 p. illus. 22 cm. $4 50 307

Contents Preliminary ideas. Differential equations of first order. Linear equations with constant coefficients. Some special higher order equations. Simultaneous equations. The linear equation of second order. Series solutions. Partial differential equations. Answers. Index.

Note A standard introductory textbook for undergraduate college courses. Although it is designed for use in both liberal arts and engineering schools, it is especially suited to the latter because of the preponderance of engineering problems. The solving of ordinary differential equations and the applications of such equations to engineering problems are the main subjects. However the student is introduced to partial differential equations in the last chapter. The second edition was published in 1949. In addition to the terminal chapter just mentioned, which was added in this edition, other changes in the series include revision and rewriting of the first three chapters and the addition of many new problems.

RICHARDSON, C. H.

An introduction to the calculus of finite differences. New York D Van Nostrand Company, Inc., 1954 142 p 24 cm. $5.50. 308

Contents Introduction. Finite integration and applications. Bernoulli and Euler polynomials. Interpolation. Approximate integration. Beta and gamma functions. Difference equations. Appendices: Mathematical induction. Hyperbolic functions. Index.

Note Planned specifically as a text for short courses at the advanced undergraduate level, this book is an elementary and simplified introduction to the finite calculus. It is intended for the instruction of students who are interested in the subject from the viewpoint of applied mathematics. The author is Professor of Mathematics in Bucknell University.

RIDER PAUL REECE

Analytic geometry New York The Macmillan Company 1947 383 p. illus. 21 cm. $4.00 309

Contents: Plane analytic geometry: Rectangular coordinates. Equation and locus. Straight line. Polynomial and power-function curves. Circle. Parabola, ellipse, hyperbola. Curve sketching. Exponential and logarithmic curves. Trigonometric curves. Parametric equations. Polar coordinates. Curve fitting. Space analytic geometry: Rectangular coordinates and directions in space. Plane and line. Surfaces and curves. Tables. Index. Answers to odd numbered exercises.

Note A mathematics text for university students in engineering and science. The book is planned for those who want a thorough preparation for later courses in calculus, and also for those who are studying analytic geometry simply for the educational and disciplinary values involved. The author's inclusion of a chapter on curve fitting is valuable and timely in view of modern demands from many fields for geometric representation of statistical data. Previous work in college algebra and trigonometry is required.

RITT JOSEPH FELS

Integration in finite terms Liouville's theory of elementary methods. New York Columbia University Press 1948 100 p. 22 cm. o.p. 310

Contents: Elementary functions of one variable. Algebraic functions with elementary integrals. Integration of transcendental functions. Further questions on the elementary functions. Series of fractional powers. Integration of differential equations by quadratures. Implicit and explicit elementary solutions of differential equations of the first order. Further implicit problems. References.

Note J. Liouville, a French mathematician of the 19th century, developed a theory of integration in finite terms and used it to prove among other things that elliptic integrals of the first and second kinds and the probability integral are not elementary. He proved also that Bessel's equation is not integrable by quadratures except for special values of the parameter. This monograph describes Liouville's work and that of some of his followers.

RITT, JOSEPH FELS

Theory of functions Revised edition. New York Columbia University Press, 1947 181 p. illus. 28 cm. $3.50. 311

Contents (abridged) The real number system. Linear point sets. Functions and continuity. Riemann integration. Infinite series of numbers. Sequences of functions. Functions of two variables. Complex and hypercomplex numbers. Curves and regions. Curvilinear integrals. Jordan curves. Analysis situs of the triangle. The Cauchy integral theorem for triangles. Extension of the Cauchy integral

functions. Trigonometric equations. Complex numbers. Table 11 Natural functions. Trigonometric formulas. Answers. Index. Mathematical tables.

Note. In this standard textbook, trigonometry is treated at the college level. The book is designed for the instruction of students who will do further work in mathematics. In addition to covering that aspect of trigonometry which is concerned with the solution of triangles, much space is given to the wider implications of trigonometric functions in physics, engineering, and in higher mathematics, particularly complex numbers. The *second edition* was published in 1943 and covered spherical trigonometry as well as plane trigonometry. Spherical trigonometry is not treated in this third edition. Other important changes include reversing the order of the first two chapters, so that the book now begins with a chapter on the general angle; thorough revision of the chapter on complex numbers, and the addition of many new exercises for the student to solve. The section of mathematical tables has not been changed.

NEWELL, HOMER E., JR.

Vector analysis. New York: McGraw-Hill Book Company, Inc., 1955. 216 p. 24 cm. (International series in pure and applied mathematics, William Ted Martin, consulting editor) $5.50 298

Contents: Part 1, Theory. Scalars and vectors. A review of some mathematical concepts. Differentiation of vectors. Divergence and curl. The operator ∇. Relationships involving ∇. Curvilinear coordinates. General theorems and potential theory. Part 11, Applications. Miscellaneous applications. Motions in space. A sketch of electromagnetic theory. Answers to exercises in Part 1. Index.

Note: A textbook developed specifically for students interested in vector analysis from the viewpoint of applied mathematics. The author encourages readers to think of vectors in terms of physical or geometric quantities in such passages as the following: "A force vector, for example, is followed and attached to the point of application of the physical force itself. Again, within a moving fluid, the velocity of flow can be represented by what is called a *field of vectors*. With each point in the region of flow may be associated a vector representing the speed and direction of flow. . . . Such vector fields are constantly met with in physics and engineering." Nevertheless the mathematical aspects are not neglected. The algebra of vectors is covered concisely in the first chapter and in the second chapter calculus is reviewed. The remaining six chapters in Part 1 are devoted to mathematical concepts and techniques pertinent to vector analysis. In Part 11 a wide variety of applications is covered.

OSGOOD, WILLIAM FOGG, AND WILLIAM C. GRAUSTEIN

Plane and solid analytic geometry. New York: The Macmillan Company, 1930. 614 p. illus. 18 cm. $6.50 299

Contents: Plane analytic geometry. Directed line-segments. Projections. Coordinates. Curves and equations. The straight line. Applications. The circle. Introductory problems in loci. Symmetry of curves. The parabola. The ellipse. The hyperbola. Certain general methods. Polar coordinates. Transformation of coordinates. The general equation of the second degree. Loci, auxiliary variables, inequalities. Diameters. Poles and polars. Transformations of the plane. Strain. Determinants and their applications. Solid analytic geometry. Projections. Coordinates. Direction cosines. Direction components. The plane. The straight line. The plane and the straight line, advanced methods. Spheres, cylinders, cones. Surfaces of revolution. Quadric surfaces. Spherical and cylindrical coordinates. Transformation of coordinates. Index.

Note: A text for use in elementary college courses in which algebraic difficulties are given special attention and numerous examples are used as illustrations. More material than is usual in introductory college courses is included.

PALEY, RAYMOND EDWARD ALAN CHRISTOPHER, AND NORBERT WIENER

Fourier transforms in the complex domain. New York: American Mathematical Society, 1934. 184 p. illus. 25 cm. (American Mathematical Society. Colloquium publications. Vol. XIX) $4.00 300

Contents. Quasi-analytic functions. Szász's theorem. Certain integral expansions. A class of singular integral equations. Entire functions of the exponential type. The closure of sets of complex exponential functions. Non-harmonic Fourier series and a gap theorem. Generalized harmonic analysis in the complex domain. Random functions. The harmonic analysis of random functions. Bibliography. Index.

Note. This volume covers a great variety of topics which are unified by the central idea of the application of the Fourier transform in the complex domain. The authors had long been convinced of the importance of the Fourier-Mellin transforms as a tool in analysis but knew of no systematic development of their use. Perhaps the nearest approach to such a development is found in the researches of H. Bohr, Jessen, and Besicovitch. With its aid, they were able to attack such diverse analytic questions as those of quasi-analytic functions, Mercer's theorem on summability, Milne's integral equation of radiative equilibrium, the theorems of Müntz and Szász concerning the closure of sets of powers, and Titchmarsh's theory of entire functions of semi-exponential type with real negative zeros.

PEIRCE, B. O.

A short table of integrals. Fourth edition. Revised by Ronald M. Foster. Boston: Ginn and Company, 1956. 189 p. 21 cm. $2.50 301

Contents (abridged): Introduction. Part 1, Indefinite integrals: Fundamental forms. Rational algebraic functions. Irrational algebraic functions. Miscellaneous algebraic expressions. Transcendental functions. Part 11, Definite integrals: Miscellaneous definite integrals. Elliptic integrals. Part 111, Auxiliary formulas: Trigonometric functions. Inverse trigonometric functions. Hyperbolic functions. Elliptic functions. Bessel functions. Series and products. Derivatives. General formulas of integration. Integrals useful in the theory of alternating currents. Part 1V, Numerical tables: The probability integral. The complete elliptic integrals, K and E. The gamma function. Common logarithm of the gamma function. Exponential and hyperbolic functions. Natural logarithms of numbers from 0.01 to 0.99. Natural logarithms of integers from 10 to 209. Four-place common logarithms. Natural and logarithmic trigonometric functions. Equivalents of radians in degrees, minutes, seconds. Squares, cubes, roots, reciprocals. Greek alphabet.

Note: A short but useful compilation of fundamental forms of integrals, and associated functions and formulas. The fourth part contains 14 useful tables. The first edition was published in 1929. Numerous additions had been made in succeeding editions, but in this fourth edition all have been inserted in their appropriate places; corrections have been made; the section on Bessel functions has been revised; one table has been added in the fourth part of the volume; and several tables have been much extended.

PHILLIPS, HENRY BAYARD

Differential equations. Third edition revised. New York: John Wiley & Sons, Inc., 1951. 149 p. illus. 22 cm. $3.25 302

Contents: Differential equations of the first order with variables separable. Other equations of the first order. Special types of second order equations. Linear equations with constant coefficients. Answers. Index.

Note: A standard textbook for use in undergraduate college courses. It is concisely and clearly written. Most of the examples worked out in the text illustrate applications in science and engineering. The author is a member (emeritus) of the faculty of Massachusetts Institute of Technology.

RAINVILLE, EARL DAVID

Elementary differential equations. New York: The Macmillan Company, 1952. 392 p. illus. 21 cm. $5.00 303

Contents: Definitions, elimination of arbitrary constants. Equations of the first order and first degree. Additional methods for equations of the first order and first degree. Orthogonal trajectories. Hyperbolic functions. Linear equations with constant coefficients. Nonhomogeneous equations: Undetermined coefficients—operational methods. Applications. Electric circuits and networks. Variation of parameters and other methods. Equations of order one and higher degree. Special equations of order two. The power series method. Solutions near regular singular points. Additional topics on power series solutions. The existence of solutions. Numerical methods. Partial differential equations. Fourier series. Boundary value problems. Supplements A, B, C. Index.

Analysis

Note: A textbook designed for use in full-length, introductory courses in differential equations. Because particular attention is paid to methods of solving differential equations, it is especially suitable for students majoring in science or in engineering. However, direct applications to problems in physics and engineering are concentrated in two chapters. The first 11 chapters are reprint of the material published in the author's Short course in differential equations, New York, 1949 210 p. $3.00.

RAINVILLE, EARL DAVID

Intermediate course in differential equations. New York John Wiley & Sons Inc., 1943 213 p. 21 cm. $5.25 304

Contents: Linear equations of the second order. Riccati equations. Preliminary material on complex variables. Solution in series. Equations of Fuchsian type. The hypergeometric equation. Confluence of singularities. Whittaker's confluent hypergeometric equation. Some classical equations. Applications. Index

Note: This textbook for advanced students of mathematics, chemistry and physics is intended to bridge the gap between elementary courses and really advanced courses, and attempts to furnish the student with further tools for constructing computable solutions for specific differential equations, in particular for linear equations in the neighborhood of regular singular points. A knowledge of advanced calculus is assumed.

RANDOLPH, JOHN ADAM FITZ, AND MARK KAC

Analytic geometry and calculus. New York The Macmillan Company 1946 642 p. illus. 24 cm. $7.50. 305

Contents: Coordinate systems. Functions, limits, derivatives. Derivatives and derivative systems. Applications of derivatives. Differentials, increments, and approximations. Definite integrals. Analytic geometry complemented by calculus. Trigonometric and inverse trigonometric functions. Logarithmic and exponential functions. Indefinite integration. Further applications of definite integrals. Approximations of definite integrals. Parametric equations, curvature, polar coordinates. Law of the mean, Taylor's theorem, evaluation of limits. Solid analytic geometry and partial derivatives. Multiple integrals. Table of integrals. Selected answers to problems. Index.

Note: By emphasizing graphs, the authors of this work have treated calculus and analytic geometry in a way that demonstrates the fundamental concepts of each and the complementary relationships between them. The book is designed as a college textbook. Its text is arranged so that it may be used either in a survey course or a thorough course. A generous number of examples and problems is furnished.

RANDOLPH JOHN ADAM FITZ

Calculus. New York The Macmillan Company 1952 483 p. 24 cm. $6.00 306

Contents: Functions, limits, derivatives. The definite integral. Applications of derivatives. Transcendental functions. Indefinite integration. Solid geometry. Partial derivatives. Multiple integrals. Further applications. Approximations. Series. Appendix. Table of integrals. Answers. Index.

Note: An introductory college textbook with several interesting pedagogical features. The author believes in the gradual introduction of important concepts and techniques; hence, the exposition of ideas new to the student is usually foreshadowed by the introduction of material that demonstrates the necessity for it. The direct connection between analytic geometry and calculus is shown in the first part. The derivatives of sine and cosine functions are introduced early and definite integrals are taken up before indefinite integrals. The author is Chairman of the Department of Mathematics of the University of Rochester

REDDICK, HARRY W AND DONALD E. KIBBEY

Differential equations. Third edition. New York John Wiley & Sons, Inc., 1956 304 p. illus. 22 cm. $4.50 307

Contents: Preliminary ideas. Differential equations of first order. Linear equations with constant coefficients. Some special higher order equations. Simultaneous equations. The linear equation of second order. Series solutions. Partial differential equations. Answers. Index.

Note: A standard introductory textbook for undergraduate college courses. Although it is designed for use in both liberal arts and engineering schools, it is especially suited to the latter because of the preponderance of engineering problems. The solving of ordinary differential equations and the applications of such equations to engineering problems are the main subjects. However the student is introduced to partial differential equations in the last chapter. The second edition was published in 1949. In addition to the terminal chapter just mentioned, which was added in this edition, other changes in the recent include revision and rewriting of the first three chapters and the addition of many new problems.

RICHARDSON, C. H

An introduction to the calculus of finite differences. New York D Van Nostrand Company Inc., 1954 142 p. 24 cm. $5.50 308

Contents: Introduction. Finite integration and applications. Bernoulli and Euler polynomials. Interpolation. Approximate integration. Beta and gamma functions. Difference equations. Appendix Mathematical induction. Hyperbolic functions. Index.

Note: Planned specifically as a text for short courses at the advanced undergraduate level, this book is an elementary and simplified introduction to the finite calculus. It is intended for the instruction of students who are interested in the subject from the viewpoint of applied mathematics. The author is Professor of Mathematics in Bucknell University

RIDER, PAUL REECE

Analytic geometry New York The Macmillan Company 1947 383 p. illus. 21 cm. $4.00 309

Contents: Plane analytic geometry. Rectangular coordinates. Equation and locus. Straight line. Polynomial and power function curves. Circle. Parabola, ellipse, hyperbola. Curve sketching. Exponential and logarithmic curves. Trigonometric curves. Parametric equations. Polar coordinates. Curve fitting. Space analytic geometry: Rectangular coordinates and directions in space. Plane and line. Surfaces and curves. Tables. Index. Answers to odd numbered exercises.

Note: A mathematics text for university students in engineering and science. The book is planned for those who want thorough preparation for later courses in calculus, and also for those who are studying analytic geometry mainly for the educational and disciplinary values involved. The author's inclusion of a chapter on curve fitting is valuable and timely in view of modern demands from many fields for geometric representation of statistical data. Previous work in college algebra and trigonometry is required.

RITT JOSEPH FELS

Integration in finite terms Liouville's theory of elementary methods. New York Columbia University Press 1948 100 p. 22 cm. o.p. 310

Contents: Elementary functions of one variable. Algebraic functions with elementary integrals. Integration of transcendental functions. Further questions on the elementary functions. Series of fractional powers. Integration of differential equations by quadratures. Implicit and explicit elementary solutions of differential equations of the first order. Further implicit problems. References.

Note: J. Liouville French mathematician of the 19th century developed a theory of integration in finite terms and used it to prove among other things that elliptic integrals of the first and second kinds and the probability integral are not elementary. He proved also that Bessel's equation is not integrable by quadratures except for special values of the parameter. This monograph describes Liouville's work and that of some of his followers.

RITT, JOSEPH FELS

Theory of functions. Revised edition. New York Columbia University Press, 1947 181 p illus. 28 cm. $3.50 311

Contents (abridged): The real number system. Linear point sets. Functions and continuity. Riemann integration. Infinite series of numbers. Sequences of functions. Functions of two variables. Complex and hypercomplex numbers. Curves and regions. Curvilinear integrals. Jordan curves. Analytic situs of the triangle. The Cauchy integral theorem for triangles. Extensions of the Cauchy integral

functions. Trigonometric equations. Complex numbers. Table II Natural functions. Trigonometric formulas. Answers. Index. Mathematical tables.

Note In this standard textbook, trigonometry is treated at the college level. The book is designed for the instruction of students who will do further work in mathematics. In addition to covering that aspect of trigonometry which is concerned with the solution of triangles, much space is given to the wider implications of trigonometric functions in physics, engineering, and in higher mathematics, particularly complex numbers. The second edition was published in 1943 and covered spherical trigonometry as well as plane trigonometry Spherical trigonometry is not treated in this third edition. Other important changes include reversing the order of the first two chapters, so that the book now begins with a chapter on the general angle, thorough revision of the chapter on complex numbers, and the addition of many new exercises for the student to solve. The section of mathematical tables has not been changed.

NEWELL, HOMER E , JR.

Vector analysis New York McGraw Hill Book Company, Inc., 1955 216 p 24 cm. (International series in pure and applied mathematics, William Ted Martin, consulting editor) $5 50 298

Contents Part I, Theory Scalars and vectors. A review of some mathematical concepts. Differentiation of vectors. Divergence and curl. The operator ∇ Relationships involving ∇ Curvilinear coordinates. General theorems and potential theory Part II, Applications: Miscellaneous applications. Motions in space. A sketch of electromagnetic theory Answers to exercises in Part I. Index.

Note A textbook developed specifically for students interested in vector analysis from the viewpoint of applied mathematics. The author encourages readers to think of vectors in terms of physical or geometric quantities in such passages as the following A force vector for example, is followed and attached to the point of application of the physical force itself. Again, within a moving fluid, the velocity of flow can be represented by what is called a *field of vectors* With each point in the region of flow may be associated a vector representing the speed and direction of flow such vector fields are constantly met with in physics and engineering. Nevertheless the mathematical aspects are not neglected. The algebra of vectors is covered concisely in the first chapter and in the second chapter calculus is reviewed. The remaining six chapters in Part are devoted to mathematical concepts and techniques pertinent to vector analysis. In Part II a wide variety of applications is covered.

OSGOOD, WILLIAM FOGG, AND WILLIAM C GRAUSTEIN

Plane and solid analytic geometry New York The Macmillan Company, 1930, 614 p illus 18 cm $6 50 299

Content Plane analytic geometry Directed line-segments. Projections. Coordinates. Curves and equations The straight line. Applications. The circle. Introductory problems in loci. Symmetry of curves. The parabola. The ellipse. The hyperbola. Certain general methods. Polar coordinates. Transformation of coordinates. The general equation of the second degree Loci, auxiliary variables, inequalities. Diameters. Poles and polars Transformations of the plane. Strain. Determinants and their applications. Solid analytic geometry Projections. Coordinates Direction cosines. Direction components. The plane The straight line. The plane and the straight line, advanced methods Spheres, cylinders, cones. Surfaces of revolution Quadric surfaces. Spherical and cylindrical coordinates Transformation of coordinates. Index.

Note. A text for use in elementary college courses in which algebraic difficulties are given special attention, and numerous examples are used as illustrations. More material than is usual in introductory college courses is included.

PALEY, RAYMOND EDWARD ALAN CHRISTOPHER, AND NORBERT WIENER

Fourier transforms in the complex domain New York American Mathematical Society 1934 184 p illus. 25 cm (American Mathematical Society Colloquium publications. Vol. XIX) $4 00 300

Contents Quasi-analytic functions. Szász's theorem. Certain integral expansions. A class of singular integral equations. Entire functions of the exponential type. The closure of sets of complex exponential functions. Non-harmonic Fourier series and a gap theorem. Generalized harmonic analysis in the complex domain. Random functions. The harmonic analysis of random functions. Bibliography Index.

Note: This volume covers a great variety of topics which are unified by the central idea of the application of the Fourier transform in the complex domain. The authors had long been convinced of the importance of the Fourier Mellin transforms as a tool in analysis but knew of no systematic development of their use. Perhaps the nearest approach to such a development is found in the researches of H Bohr Jessen, and Besicovitch. With its aid, they were able to attack such diverse analytic questions as those of quasi-analytic functions, Mercer's theorem on summability, Milne's integral equation of radiative equilibrium, the theorems of Müntz and Szász concerning the closure of sets of powers, and Titchmarsh's theory of entire functions of semi-exponential type with real negative zeros.

PEIRCE, B O

A short table of integrals Fourth edition Revised by Ronald M Foster Boston Ginn and Company, 1956 189 p 21 cm $2.50 301

Contents (abridged) Introduction. Part I, Indefinite integrals Fundamental forms. Rational algebraic functions. Irrational algebraic functions. Miscellaneous algebraic expressions. Transcendental functions. Part II, Definite integrals: Miscellaneous definite integrals. Elliptic integrals. Part III, Auxiliary formulas: Trigonometric functions. Inverse trigonometric functions. Hyperbolic functions. Elliptic functions. Bessel functions. Series and products. Derivatives. General formulas of integration. Integrals useful in the theory of alternating currents. Part IV Numerical tables The probability integral. The complete elliptic integrals, K and E. The gamma function. Common logarithm of the gamma function. Exponential and hyperbolic functions. Natural logarithms of numbers from 0.01 to 0.99 Natural logarithms of integers from 10 to 209 Four-place common logarithms. Natural and logarithmic trigonometric functions. Equivalents of radians in degrees, minutes, seconds. Squares, cubes, roots, reciprocals. Greek alphabet.

Note A short but useful compilation of fundamental forms of integrals, and associated functions and formulas. The fourth part contains 16 useful tables. The first edition was published in 1929 Numerous additions had been made in succeeding editions, but in this fourth edition all have been inserted in their appropriate places, corrections have been made the section on Bessel functions has been revised one table has been added in the fourth part of the volume and several tables have been much extended.

PHILLIPS, HENRY BAYARD

Differential equations. Third edition revised New York John Wiley & Sons, Inc. 1951 149 p illus 22 cm. $3.25 302

Contents. Differential equations of the first order with variables separable. Other equations of the first order Special types of second order equations. Linear equations with constant coefficients. Answers. Index.

Note. A standard textbook for use in undergraduate college courses. It is concisely and clearly written. Most of the examples worked out in the text illustrate applications in science and engineering. The author is member (emeritus) of the faculty of Massachusetts Institute of Technology

RAINVILLE, EARL DAVID

Elementary differential equations. New York The Macmillan Company, 1952 392 p illus. 21 cm $5 00 303

Content Definitions, elimination of arbitrary constants. Equations of the first order and first degree. Additional methods for equations of the first order and first degree Orthogonal trajectories. Hyperbolic functions. Linear equations with constant coefficients Nonhomogeneous equations Undetermined coefficients—operational methods. Applications. Electric circuits and networks. Variation of parameters and other methods. Equations of order one and higher degree. Special equations of order two. The power series method. Solutions near regular singular points. Additional topics on power series solutions. The existence of solutions. Numerical methods. Partial differential equations. Fourier series. Boundary value problems. Supplements A, B, C. Index.

Note: The subject of the problem of moments has extensive literature, but has not hitherto been treated in book form. The main attention is given to the classical moment problem, but a special chapter is devoted to the theory of approximate ("mechanical") quadratures, which is intimately related to the theory of moments.

SMITH EDWARD STAPLES AND OTHERS

Analytic geometry Second edition. By Edward S Smith Meyer Salkover and Howard K. Justice. New York John Wiley & Sons, Inc., 1954 306 p. illus. 22 cm. $4.00 318

Contents: Plane analytic geometry: Coordinates. Locus, equation, graph. The straight line. Conic sections. The circle. The parabola. The ellipse. The hyperbola. Transformation of coordinates. The general equation of the second degree. Tangents and normals. Higher plane curves. Polar coordinates. Parametric equations. Empirical equations. Solid analytic geometry: Cartesian coordinates in space. Space loci. The plane. The straight line. Surfaces. Appendix. Formulas for reference. Tables. Answers to odd-numbered problems. Index.

Note: A standard college text, written by members of the faculty of the University of Cincinnati. It is introductory to the study of analytic geometry and is designed to prepare the student for further work in science or engineering. To facilitate comprehension on the part of the student, the authors have included many worked examples and a large number of drawings. The first edition was published in 1941. The second edition is essentially the same, but does include revised problems and several improved treatments of specific topics.

SMITH EDWARD STAPLES AND OTHERS

Unified calculus, by Edward S Smith, Meyer Salkover and Howard K. Justice. New York John Wiley & Sons, Inc. 1947 534 p. illus. 22 cm. $5.50 319

Contents: Variables, functions, and limits. Differentiation and applications. Integration, area, volume. Centroid, moment of inertia, pressure, work. Differentiation of algebraic functions. Differentiation of transcendental functions. Further applications of derivatives. Plane curves—rectangular coordinates. Integration. Methods of integration. Further applications of integration. Approximate integration. Indeterminate forms. Infinite series. Expansion of functions. Hyperbolic functions. Partial differentiation. Multiple integrals. Differential equations. Table of integrals. Formulas for reference. Tables. Index.

Note: A revision of the authors' Calculus, New York, 1938. It is designed for introductory college classes. The arrangement of subject matter is intended to emphasize the basic unity of differential and integral calculus, and to make it possible for the student to make early use of the techniques of both. Throughout the work in this edition, there are a number of minor revisions, and the entire chapter on differential equations has been added. The authors are members of the faculty of the University of Cincinnati.

SOKOLNIKOFF IVAN STEPHEN

Advanced calculus New York McGraw Hill Book Company Inc., 1939 446 p. illus. 23 cm. $7.00. 320

Contents (abridged): Limits and continuity. Derivatives and differentials. Functions of several variables. Definite integrals. Multiple integrals. Line integrals. Infinite series. Power series. Applications of power series. Improper integrals. Fourier series. Implicit functions.

Note: This book, intended for the student with one year of preparation in calculus, seeks to develop a critical attitude toward analytical processes. The many rigorous arithmetic proofs are supplemented by further bibliographical references. There are numerous illustrative exercises and problems scattered throughout the text.

SPENCELEY GEORGE WELLINGTON AND R. M SPENCELEY

Smithsonian elliptic functions tables. Prepared by G W and R. M Spenceley (Publication 3863) Washington, D C. The Smithsonian Institution, 1947 366 p. 24 cm. (Smithsonian miscellaneous collections. Vol 109 whole volume) $4.50 321

Contents: Preface. Elliptic functions tables $\theta = 1°$ to $\theta = 89°$. Appendix. Hyperbolic functions. Circular functions.

Note: A series of tables printed to 12 decimal figures presenting values as follows for elliptic functions from $\theta = 1°$ to $\theta = 89°$ and from [illegible] = 0 to [illegible] = 90 [illegible] = (v/90)K = F(θ,1), [illegible] E(θ, 1), A(v), D(v).

SPRAGUE, ATHERTON HALL

Calculus. New York The Ronald Press Company 1952 576 p. illus. 24 cm. $6.50 322

Contents: Function—limit—continuous function. The derivative. Further derivative formulas and techniques. Maxima and minima—related rates. Inverse functions—parametric equations. The trigonometric functions. The exponential and logarithmic functions. Differentials. Polar coordinates. Curvature. Curvilinear motion. The mean value theorem. Curve tracing. Integration. The definite integral. Geometric applications of the definite integral. Physical applications of the definite integral. Infinite series. Solid analytic geometry. Partial differentiation. Curves and surfaces in space. Multiple integrals. Table of integrals. Formulas for reference. Answers to problems. Index.

Note: An introductory textbook for college students who have completed courses in plane trigonometry and plane analytic geometry. In the words of the author: "The purpose of this book is to present the elements of the calculus as simply as possible without sacrificing rigor. Hence analytic proofs which might cause difficulty are accompanied by detailed explanation." Applications of the material to geometry and physics are shown, and many illustrative problems are provided. The author is Professor of Mathematics in Amherst College.

STEEN FREDERICK H, AND DONALD H BALLOU

Analytic geometry Third edition. Boston Ginn and Company 1955 225 19 p. illus. 24 cm $3.75 323

Contents: Introduction. Curves and equations. The straight line. The circle. The parabola. The ellipse and the hyperbola. Rotation of axes. Higher plane curves. Parametric equations. Polar coordinates. Empirical equations and curve fitting. Coordinates in space. The plane. The straight line. Surfaces. Tables and formulas. Answers. Index.

Note: The figures, of which there are 211 in this third edition, are a special feature of this well-organized textbook for introductory courses in analytic geometry. The first edition was published in 1943 and the second edition in 1946. In comparison to the preceding edition, the scope and organization are unchanged, but several sections have been revised and many new exercises for the student have been added. The treatment, original with the authors, of the problem of finding the equation of a given locus, which was a feature of the first and second editions, has been retained, and several topics including division of a line segment and the normal form of the equation of a line are given new treatments in this edition.

STRATTON J A. AND OTHERS

Spheroidal wave functions including tables of separation constants and coefficients. By J A. Stratton, P M Morse, L. J Chu J D C. Little, and F J Corbató New York Published jointly by The Technology Press of M.I.T and John Wiley & Sons, Inc., 1956 613 p. illus 29 cm. $12.50. 324

Contents: Elliptic and spheroidal wave functions. Introduction to the tables. Tables.

Note: A reference book of primary importance to physicists and engineers working in such fields as radar and acoustics. It contains (1) a foreword in which the importance of the wave equation is pointed out and the present state of techniques and the availability of tables for solving the wave equation in various systems of coordinates are critically appraised; (2) a monograph by L. J Chu and J. A. Stratton entitled, "Elliptic and spheroidal wave functions," reprinted from the *Journal of mathematics and physics*, August, 1941; (3) an "Introduction to the tables," by J. D. C.

theory to polygons. Infinite sequences and infinite series of analytic functions. Power series. T ylor's expansion. Liouville's theorem and the fundamental theorem of algebra. Laurent series. *Singularities of analytic functions.* Periodic functions. The Weierstrass factorization theorem Meromorphic functions and Mittag-Leffler's theorem Theory of residues. Analytic continuation.

Note A textbook for advanced undergraduate and graduate students in mathematics. The work is designed as foundation for one-year course in the subject in which approximately 20 periods of 75 minutes each are devoted to discussion of the real variable and 36 periods of the same length are given to consideration of the complex variable. Completion of the course equips the student to deal effectively with almost any topic of mathematical analysis. In treat ing the real umber system, the author relies upon infinite decimals rather than upon the Dedekind or Cantor theories. All geometrical questions are formulated in arithmetic terms, and every topological assumption made is explicitly stated.

SALZER, HERBERT E

Table of coefficients for obtaining the first derivative without differences Washington, D C Government Printing Office 1948 20 p 27 cm. (United States National Bureau of Standards Applied mathematics series 2) $0 15 312

Note: The numerical data presented in these tables were obtained by differentiation of the Lagrangian interpolation formula $f'(x_0 + ph) \sim \frac{1}{hC(\ )} \sum C_i^{(n)}(p) f(x_0 + ih)$ [illegible]. They give the values of the polynomials $C_i^{(n)}(p)$ for p ranging from $-[(-1)/2]$ to $[/2]$. For $= 4$ 5 and 6, the polynomials are tabulated at intervals of 0.01; for $= 7$ they are tabulated t intervals of 0.1

SALZER, HERBERT E

Tables of coefficients for the numerical cal culation of Laplace transforms Washington D C Government Printing Office, 1953 36 p 26 cm (United States. National Bureau of *Standards Applied mathematics series.* No 30) $0.30 313

Contents Introduction. Schedule A, Lagrange interpolation coefficients, 2-point through 11 point. Schedule B, Laplace transforms of interpolation coefficients, 2 point through 11 point. Table Laplace transforms of Lagrange coefficients, 2-point through 11 point. T ble n, $1/p^{n+1}$ $= 0(1)10$ $p = 0\ 1(.1)10$.

Note The tables of coefficients published in this booklet are to facilitate the numerical evaluation of infinite integrals expressible in the form of Laplace transforms, such as arise in the theory of heat conduction and in variou branches of electrical engineering The author prepared the publication in the Computation Laboratory of the National Bureau of Standards.

SCHAEFFER, ALBERT CHARLES, AND DON ALD CLAYTON SPENCER

Coefficient regions for schlicht functions New York American Mathematical Society, 1950 311 p illus (part col d) 26 cm (American Mathematical Society Colloquium publi cations Vol xxxv) $6 00 314

Contents (abridged): History of schlicht functions nd elementary properties of the nth region. Variations of schlicht functions. The critical points of the differential equation. The Γ structure. Functions which are regular in $|z| < 1$ and satisfy the differential equation. The length-area principle. Löwner curves. Linear forms and the supporting surface. The portion of the boundary of V corresponding to single analytic arcs. Parametrization of the boundary of V_n. The region V A method for investigating the conjecture $|a_4| \leq 4$ The region of values of the derivative of schlicht function, by A. Grad. Appendix. Bibliography Index.

Note This monograph is presentation of the results of the investigations by the thors during the last few years of the family of extremal schlicht functions. Most of the material is new In the calculus of variations, there are two classical *approaches* (a) study of specific problems using local variations; (b) study of a whole class of extremal problems and the investigation of the structure of the class as a whole. I this monograph the authors have sought to *develop systematic* pproach to problems of type (b). In order to keep the treatment within manageable length the authors have confined themselves to extremal problems relating to finit number of the coefficients in the T ylor expansion of f nction which is regular *and schlicht inside the* nit circle. A chapter by Dr A. Grad in which he investigates the region of possible values of the derivative of schlicht function t fixed point inside the unit circle provides a further example of these methods.

SCOTT, E J

Transform calculus with an introduction to complex variables New York Harper & Brothers, 1955 330 p illus. 24 cm. (Harper's mathematics series, Charles A. Hutchinson, editor) $7 50 315

Contents Functions of a complex variable. The Laplace transformation and its inverse. Properties of the Laplace transformation. Ordinary linear differential equations with constant coefficients. Matrix algebra and systems of linear differential equations. Linear difference equations with constant coefficients. Linear partial differential equations. *Gamma, error* and Bessel functions. *Asymptotic series.* Non-elementary integrals. Integral equations. Further problems in partial differential equations. The finite Fourier sine, cosine and Hankel transforms. Appendixes References. Tables of operations. Table of Laplace transforms. Table of finit sine transforms. Table of finite cosine transforms. Index.

Note A textbook developed at the University of Illinois and addressed to graduate engineers and other readers who are primarily *interested in the applications* f mathematics. The greater part of the space is devoted to the Laplace transformation, which is taught from the standpoint of functions of a complex variable. Numerous worked problems are included in the expository matter Most of the problems solved and also the problems for the student to solve illustrate applications in science and engineering. The final chapter provides a quick view of other transforms, some of which have found applications in engineering.

SHERWOOD, G E F, AND ANGUS E TAYLOR

Calculus. Third edition Englewood Cliffs, N J Prentice-Hall, Inc., 1954 579 p illus. 23 cm. $7 25 316

Contents: Fundamental concepts. *Elementary techniques* and applications. General formulas of differentiation—algebraic functions. Applications. Differentiation of transcendental functions with applications. Differentials—the law of the mean. Further applications. The inverse of differentiation. *The definite integral.* The technique of integration. Geometrical applications of definite integrals. Physical applications of definite integrals. The hyperbolic functions. Further study of limits. Infinite series and Taylor's formula. Power series. *Analytical geometry of three dimensions.* Partial differentiation. Curves and surfaces in space—envelopes. Double integrals. Triple integrals. Appendix. Index.

Note A college textbook designed as an introduction for prospective *engineers, mathematicians,* and scientists. Particular attention is given to the applications of calculus in science and engineering, and numerous exercises and problems are provided for each topic. The first edition was published in 1942 and the second edition in 1946. Without changing the scope of the book, several chapters are extensively rewritten in preparing this third edition. Also, the order of some of the topics was revised.

SHOHAT, JAMES ALEXANDER, AND J D TAMARKIN

The problem of moments. New York American Mathematical Society 1943 140 p 26 cm (Mathematical surveys. No 1) $3.35 317

Contents: Brief historical review Distribution functions. Theorems of Helly Extension theorems for non-negative functionals. Stieltjes inversion formula. The Hamburger moment problem. The Stieltjes moment problem. The trigonometric moment problem. The Hausdorff one-dimensional moment problem. The Hausdorff two-dimensional moment problem. Theory of the Hamburger moment problem. Various modifications of the moment problem. Approximate quadratures. Bibliography Index.

tions. Precision, errors, and the slide rule. Coordinates and graphs. Useful tables.

Note: A comprehensive view of trigonometry appropriate to college study is presented in this text. No previous instruction in the subject is assumed. [illegible], the book begins with [illegible] chapter devoted to the elementary properties of angles and to their measurement. The two chapters on oblique triangles provide unusually full treatment of this subject [illegible] general text. Complex numbers, polar co-ordinates, and series expansions are presented as areas of trigonometry. The first edition was published in 1934. This second edition is identical in scope and organization; however, various sections of chapters have been rewritten, and revisions have been made in the exercises and problems.

THRON WOLFGANG J

Introduction to the theory of functions of a complex variable. New York John Wiley & Sons, Inc., 1953 230 p. 24 cm. $6 95 330

Contents: Fundamental concepts. Real numbers. Cardinal numbers. Complex numbers. Sums and products. Hausdorff spaces. Metric spaces. The plane of complex numbers. Limits, continuity, differentiability. Real functions of real variables. Curves and regions in the plane of complex numbers. Some combinatorial topology. Jordan curves. Rectifiable and directed curves. Integration. The Cauchy integral theorem. Sequences of functions. Infinite series. Power series. Function spaces. Elementary transcendental functions. Inverse functions. Analytic continuation and singular points. The extended plane. Classification of some single-valued analytic functions. Residues. Conformal maps. Linear fractional transformations and inversions. Simple functions and the Riemann mapping theorem. The elliptic modular function and Picard's theorems. Riemann surfaces. Index.

Note: A self-contained treatment of the theory of [illegible] complex variable. The author has avoided the familiar device—in introductory works—of referring the reader to other sources for difficult proofs, nor does he rely on intuition. All terms are precisely defined, and all results are rigorously derived from [illegible] simple set of axioms. Although an introduction as stated in the title, some advanced concepts, such as function spaces, are included.

TODD JOHN

Table of arctangents of rational numbers. Issued March 30 1951 Washington, D C. Government Printing Office, 1951 105 p. 27 cm. (United States. National Bureau of Standards. Applied mathematics series 11) $1.50. 331

Contents: Introduction. Table 1 arctan $\frac{m}{n}$ arccot $\frac{m}{n}$ and reductions of arctan $\frac{m}{n}$ [illegible] for [illegible] $< m <$ [illegible] $\leqslant$ 100. Table 2. Reductions of arctan n, for reducible [illegible] $\leqslant$ 2089

Note: [illegible] set of tables of arctangents with rational arguments prepared in response to need for the same especially in differential equations of importance in many atomic collision problems. Table 1, in addition to [illegible] + [illegible] and arctan (m [illegible]), also gives arccot (m [illegible]). The angles are expressed in radians to [illegible] decimals, and the complete reductions of arctan (m [illegible] are given for 0 < m < [illegible] $\leqslant$ 100. Table 2 gives [illegible] list of those integers [illegible] not exceeding 2089 for which arctan [illegible] is reducible and the corresponding complete reductions. The work was done in the Computation Laboratory of the National Bureau of Standards under the partial sponsorship of the Office of Naval Research of the Navy Department.

UNDERWOOD RALPH SYLVESTER, AND FRED W SPARKS

Analytic geometry Second edition. Boston Houghton Mifflin Company 1956 282 p. illus. 22 cm. $3.25 332

Contents: The co-ordinate system, with applications. The straight line. The circle. The conic sections. Simplification of equations. Transcendental curves. Rapid sketching. Polar co-ordinates. Parametric equations and special curves. Curve fitting. Applications to three dimensions. Fundamental formulas in space. The plane and the line in space. Special topics. Answers. Index.

Note: A short textbook for use in college courses. In spite of its brevity the exposition is enlivened by many comments on applications, stumbling blocks, and other points that are not found in more formal texts.

UNDERWOOD, RALPH SYLVESTER AND OTHERS

Intermediate algebra by Ralph S Underwood, Thomas R. Nelson and Samuel Selby New York The Macmillan Company 1947 283 p. illus. 21 cm. $3 60. 333

Contents: Algebra as [illegible] language and [illegible] tool. Type products and factoring. Fractions. Linear equations in one unknown. Functions and graphs. Simultaneous linear equations. Exponents and radicals. The number system. Quadratic equations. Special equations in one unknown. Simultaneous equations. Ratio, proportion, and variation. The binomial theorem. Progressions. Logarithms. Tables. Answers. Index.

Note: The authors have designed this text to meet the needs of first-year college students [illegible] who do not have [illegible] good grounding in elementary algebra. Because of its clear presentation of elementary principles, it can be used also in self-instruction by persons [illegible] who have had [illegible] high-school course.

UNITED STATES COAST AND GEODETIC SURVEY

Natural sines and cosines to eight decimal places. Washington, D C. Government Printing Office 1942 541 p. 28 cm. (United States. Coast and Geodetic Survey Special publication. No. 231) $3 75 334

Note: The tables in this volume are in steps of one degree

UNITED STATES NATIONAL BUREAU OF STANDARDS INSTITUTE FOR NUMERICAL ANALYSIS

Simultaneous linear equations and the determination of eigenvalues edited by L. J Paige and Olga Taussky Proceedings of a symposium held August 23–25 1951 in Los Angeles, California, under the sponsorship of the National Bureau of Standards in cooperation with the Office of Naval Research. Washington D C. Government Printing Office, 1953 126 p illus. 27 cm. (United States. National Bureau of Standards. Applied mathematics series. No. 29) $1.50. 335

Contents: Tentative classification of methods and bibliography on solving systems of linear equations, by G. E. Forsythe. Simultaneous systems of equations, by A. M. Ostrowski. The geometry of some iterative methods of solving linear systems, by A. S. Householder. Solutions of linear systems of equations on [illegible] relay machine, by C.-E. Fröberg. Some special methods of relaxation technique, by E. Stiefel. Errors of matrix computations, by P. S. Dwyer. Rapidly converging iterative methods for solving linear equations, by J. B. Rosser. Some problems in aerodynamics and structural engineering related to eigenvalues, by R. A. Frazer. Inclusion theorems for eigenvalues, by H. Wielandt. On general computation methods for eigenvalues and eigenfunctions, by G. Fichera. Variational methods for the approximation and exact computation of eigenvalues, by A. Weinstein. Determination of eigenvalues and eigenvectors of matrices, by M. R. Hestenes. New results in the perturbation theory of eigenvalue problems, by F. Rellich. Bounds for characteristic roots of matrices, by A. Brauer. Matrix inversion and solution of simultaneous linear algebraic equations with the IBM 604 electronic calculating punch, by G. W. Petrie, III. Experiments on the inversion of [illegible] 16 × 16 matrix, by J. Todd. A method of computing eigenvalues and eigenvectors suggested by classical results on symmetric matrices, by W. Givens. Computations relating to inverse matrices, by J. Sherman. Results of recent experiments in the analysis of periods carried out in the Istituto Nazionale per le Applicazioni del Calcolo, by G. Fichera.

Note: The development of high-speed automatic digital computing machines provided reasons for the re-examination of the methods of solution of systems of linear equations and the determination of eigenvalues. Selected mathematicians from several countries were invited to deliver papers on various aspects of the field at [illegible] symposium, and [illegible] majority of the papers are published in this volume.

Little and Fernando J Corbató, and (4) the tables proper The tables occupy 549 of the volume's pages. They were computed and typed on the Whirlwind digital computer at the Massachusetts Institute of Technology They give for both prolate and oblate spheroidal wave functions coefficients for the expansion of the radial function of the first kind in spherical Bessel functions and for the expansion of the angular function of the first kind in associated Legendre functions.

SYMPOSIUM ON PARTIAL DIFFERENTIAL EQUATIONS

Transactions of the Symposium on Partial Differential Equations held at the University of California, at Berkeley, June 20–July 1, 1955 Sponsored by the Office of Naval Research, University of California, Berkeley Calif, and American Mathematical Society Editorial committee N Aronszajn, A Douglis and C. B Morrey jr New York Interscience Publishers, Inc. 1956 334 p illus 26 cm. $6 50 325

Contents Some criteria for normality of families of continuous functions, by M. G. Arsove. Some hints on Huygens' principle and Hadamard' conjecture, by L. Asgeirsson. *Multivated harmonic functions in three variables*, by S. Bergman. Survey of local properties of solutions of elliptic partial differential equations, by L. Bers. *On the regularity properties of solutions of elliptic differential equations*, by F E. Browder On the calculus of variations in two variables, by L. Cesari. Discontinuity of solutions of quasi-linear differential equations in two variables, by Y W Chen. On singular and regular Cauchy problems, by J B Diaz. A criterion for the validity of Huygens' principle, by A. Douglis. Singularities of generalized axially symmetric potentials, by A. Erdélyi. Growth properties of solutions of non-linear elliptic equations, by R. Finn. Difference methods on digital computer for Laplacian boundary value and eigenvalue problems, by G. E. Forsythe. On the local behavior of solutions of $\Delta u = g(x, y, \ldots)$ by P Hartman. The scope and limitations of the method of Wiener and Hopf by A. E. Heins. On the existence problem for surfaces of constant mean curvature, by E. Heinz. On the reflection principle for polyharmonic functions, by A. Huber On linear differential equations in Banach spaces, by T Kato. An unsymmetric operator arising in the theory of neutron diffusion, by J Lehner A *variational method in the theory of* harmonic integrals, by C. B. Morrey jr Estimates and existence of solutions of elliptic equations, by L. Nirenberg. New isoperimetric *inequalities for eigenvalues and other physical quantities*, by J E. Payne. Remarks on Courant's nodal line theorem, by A. Pleijel. Remarks on the application of gradient mappings to the calculus of variations and the connected boundary value problems in partial differential equations, by E. H. Rothe. Mean values and continuity of Riesz potentials, by K. T Smith. On radiation conditions, by J J Stoker A direct approach to the problem of stability in the numerical solution of partial differential equations, by J Todd. Upper and lower bounds for eigenvalues by finite difference methods, by H. F Weinberger Some new methods in two-dimensional variational problems with special reference to minimal surfaces, by L. C. Young.

Note The papers published in this volume were written by *eminent mathematicians who are engaged in research in pure and* applied mathematics, and they were addressed to graduate scientists and engineers working at research and design levels that require keeping abreast of developments in the solution and applications of partial differential equations. Most of the papers include literature references.

TAUSSKY, OLGA, editor

Contributions to the solution of systems of linear equations and the determination of eigenvalues Edited by Olga Taussky Washington D C Government Printing Office 1954 139 p 27 cm (United States National Bureau of Standards. Applied mathematics series 39) $2 00 326

Contents Practical solution of *linear equations and inversion of* matrices, by L. Fox. Punched-card experiments with accelerated *gradient* methods for linear equations, by A. I. Forsythe and G. E. Forsythe. Iterative methods of solving linear problems on Hilbert space, by R. M. Hayes. Tables of inverses of finite segments of the *Hilbert* matrix, by I. R. Savage and E. Lukacs. The condition of the finite segments of the Hilbert matrix, by J Todd. Lower bounds for the rank and location of the eigenvalues of matrix, by K. *Fan and A. J Hoffman. Inequalities for eigenvalues of Hermitian* matrices, by K. Fan

Note. Most of the papers in this volume deal with aspects of the solution of simultaneous equations. The *preparation of the* papers was sponsored by various agencies of the U. S. Department of Defense. The volume serves as sequel to *Applied mathematics series 29* "Simultaneous linear equations and determination of eigenvalues, described below

THOMAS, GEORGE B, JR

Calculus Reading Mass Addison Wesley Publishing Company, Inc., 1953 616 p illus. 23 cm (Addison Wesley mathematics series, Eric Reissner, consulting editor) $8 50 327

Contents The rate of change of a function. Derivatives of algebraic functions. Applications Integration. Applications of integration to physics. Polar coordinates. Transcendental functions. Hyperbolic functions. Methods of integration. Vectors and parametric equations. Solid geometry and vectors. Partial differentiation. Multiple integrals. *Infinite series*. *Differential* equations. Appendix. Index.

Note. The chief difference between this college text and the author's *Calculus and analytic geometry* described in the next entry is that it is designed for students who have already studied analytic geometry Three chapters contained in the larger book and dealing with plane analytic geometry determinants and linear equations, and complex numbers and functions have been omitted from the present work. The chapters that are common to both works are essentially identical, but there are some variations, as, for example, in discussion of curvature and normal vectors in the chapter entitled "Vectors and parametric equations.

THOMAS, GEORGE B, JR.

Calculus and analytic geometry Second edition 1953 Reading Mass Addison Wesley Publishing Company Inc. 1953 731 p. illus 23 cm. (Addison Wesley mathematics series Eric Reissner consulting editor) $7 50 328

Contents The rate of change of function. Derivatives of *algebraic functions. Applications. Integration. Applications of integration* to physics Plane analytic geometry Polar coordinates. Transcendental functions. Hyperbolic functions. Methods of integration. Vectors and parametric equations. Determinants and linear equations. Solid geometry and vectors. Partial differentiation. Multiple integrals. Infinite series. Complex numbers and functions. Differential equations Answers to questions. Appendix. Index.

Note. An introductory textbook which was developed at the Massachusetts Institute of Technology where the author is Associate Professor of Mathematics. The exposition is slanted for students who are majoring in physics or engineering nevertheless, the treatment is thorough. The concept of the integral as limit of sum is introduced early and its fundamental nature is emphasized. *The close relations* between calculus and analytic geometry are also stressed. The first edition was published in 1931 and was printed by photolithographic process from typewritten copy The present edition has been printed from type and contains one additional chapter that on differential equations.

THOMPSON, JAMES E, AND WILLIAM H H COWLES

Trigonometry for colleges and engineering schools. Second edition. Princeton D Van Nostrand Company Inc. 1949 280 lxxiii p. illus. 23 cm $4 25 329

Contents Angles and angle measure. Trigonometric functions of angles. Functions of acute angles and trigonometric tables. Right triangles Applications and problems. Properties of *functions* of one angle. Functions of several angles Inverse trigonometric functions. Properties of oblique triangles. *Solution of oblique triangles*. Applications and problems. Polar coordinates and complex numbers. Series expansions and complex numbers. Index. Appendixes: Loga-

Note The tables presented in Volume give functional values to decimal places for $J_n(x)$ for $n = 1, 2, 3$, and 4. Methods of interpolation to obtain J (x) for other values of the index are described the introduction. The tables presented in Volume II give functional lues to 10 decimal places of $I_n(x)$ for n 1/4, 1/3, 2/3, 3/4. the range of 0 to 25 for x. The tabulations have value in the solution of problems in such fields as elasticity heat conductivity and hydrodynamics.

NITED STATES NATIONAL BUREAU OF TANDARDS

Table of the Bessel functions $J(z)$ and $J(z)$ for complex arguments Second edition. New York Columbia University Press 1947 403 p. 27 cm. $7.50 343

Contents Contour lines of $J(z)$ and $J(z)$. Contents. Introduction. Supplementary notes. Bibliography. Table of Bessel functions. Table of Lagrangian interpolation coefficients.

Note The functions of orders of zero and one, which are encountered in the general solution of boundary value problems arising in the theory of potential, heat conduction, and wave motion, are here tabulated for argument-points defined by polar coordinates. Along each of the rays at five-degree steps from 0° to 90° ten-place values of the real and imaginary parts of J ( ) and J (z) are given for moduli ranging from 0 to 10 at intervals of 0.01. The tables are useful for the evaluation of integrals involving Bessel functions, and for the solution of transcendental equations as well. The bibliography contains 64 references to the world literature relating to Bessel functions of orders zero and one.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Tables of the Bessel functions Y_0 ( ) and $Y_1(z)$ for complex arguments. Prepared by the Computation Laboratory Conducted under the sponsorship of the National Bureau of Standards Arnold N Lowan, chief The Computation Laboratory New York Columbia University Press 1949 432 p. 27 cm. $7.50. 344

Note Most of the space in this reference work is devoted to the main table in which along each of the rays $\phi = 0°, 5°$ 90° ten-place values of the real and imaginary parts of Y (z) are given for values of (z) ranging from 0 to 10 at intervals of .01. The book is a companion volume to United States. National Bureau of Standards. Mathematical Tables Project. *Table of the Bessel functions J₀(z)* and *J* (z) *for complex arguments*, described above.

UNITED STATES. NATIONAL BUREAU OF STANDARDS

Tables of the Bessel functions Y (x) Y (x) K (x) K (x) $0 \leqq X \leqq 1$ Washington, D C Government Printing Office 1952 60 p. 26 cm. (United States National Bureau of Standards. Applied mathematics series 25) $0.45 345

Contents Introduction. Table of $Y_0(x)$ and Y with auxiliary functions. Values of $C_0(x)$ and $D_0(x)$ ... (0(.0001)0.010; 8D ...). Values of Y_0 and Y ... Table of K_0 and K_1 with auxiliary functions ... Values of K_0 and K_1 ... 7D). Values of K_0 and K_1 ...

Note These tables were compiled chiefly to be of assistance to nuclear technologists in calculating the multiplicative properties of chain reacting piles, neutron distributions, etc., involving cylinder functions. ... auxiliary functions are tabulated ... the Physicists and engineers in other fields also find them useful. ... Applied Mathematics Series ... with ... reviewed in the introduction.

UNITED STATES. NATIONAL BUREAU OF STANDARDS. NATIONAL APPLIED MATHEMATICS LABORATORIES

Tables of Bessel-Clifford functions of orders zero and one. Washington, D. C. Government Printing Office 1953 72 p 26 cm. (United States National Bureau of Standards. Applied mathematics series No. 28) $0.45 346

Contents Introduction, by M. Abramowitz Mathematical properties. Applications. Interpolation. Method of computation and accuracy of entries. References. Table I, $J_0(2\sqrt{x})$ and $J_1(2\sqrt{x})$ ... Table II, Y_0 ( ) and Y ... Table III, $I_0(2\sqrt{x})$ and $I_1(2\sqrt{x})$ ... Table IV ... Table V, $K_0(2\sqrt{x})$ and $K_1(2\sqrt{x})$ ... Table VI ... Auxiliary tables. Values of $E_0(y)$ and $F_0(y)$ ... Values of ...

Note The Bessel-Clifford functions, although obtainable from existing tables of Bessel functions, have been separately tabulated and here published as a convenience to those faced with frequent need to enter the tables with an irrational argument. A further reason for the separate publication is that the Bessel-Clifford functions arise as solutions of a class of differential equations occurring in various branches of applied physics and are therefore of importance in themselves. Tabulation of the functions of orders zero and one is carried up to a point where the asymptotic expansions can be used conveniently.

UNITED STATES. NATIONAL BUREAU OF STANDARDS

Tables of Chebyshev polynomials S (x) and C (x) Washington Government Printing Office 1952 161 p. 26 cm. (United States. National Bureau of Standards. Applied mathematics series 9) $1.75 347

Contents (abridged) Analytical properties of the Chebyshev polynomials. Algebraic properties of the Chebyshev polynomials. Arithmetical properties of the Chebyshev polynomials. Functional equations. Curve fitting by Chebyshev polynomials. Solution of linear differential equations with rational coefficients by Chebyshev polynomials—the τ-method. Use of the numerical tables of the Chebyshev polynomials. References. Tables of the Chebyshev polynomials $S_n(x)$ and $C_n(x)$ ...

Note The Chebyshev polynomials $S_n(x)$ and $C_n(x)$ are tabulated in this volume. Values of functions are rounded to 12 decimal places, except in the cases where exact values could be stored in fewer decimals. The tables are preceded by 27 pages of prefatory matter on the properties of Chebyshev polynomials, directions for use of the tables, etc.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Tables of circular and hyperbolic sines and cosines for radian arguments. Washington, D C. Government Printing Office 1953 407 p. 26 cm. (National Bureau of Standards. Applied mathematics series. No. 36) $3.00. 348

Contents Introduction, by A. N. Lowan. Table I, Circular and hyperbolic sines and cosines ... 9D. Supplementary table. Table II, Circular and hyperbolic sines and cosines ... 9D. Table III, Conversion tables: degrees, minutes, seconds to radians. Table IV Multiples of ...

Note The tables presented in this volume are of value in many fields of pure and applied mathematics. Examples of applications include computations concerning the periodic flow of solar heat at given depth in the earth, the catenary curve assumed by cable suspended between two points, calculations involving use of the Fourier series, and computations on elasticity. This is the third edition of a set of tables originally published in 1940. Eight errors reported in the earlier editions are listed in the preface and have been

The reports on simultaneous linear equations are confined to finite systems, but those on the determination of eigenvalues deal with both discrete and continuous cases and include reports specifically on the determination of bounds for the eigenvalues.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Table of arctan x (A reissue of Mathematical table 16) Washington, D C. Government Printing Office, 1953 170 p 27 cm. (National Bureau of Standards Applied mathematics series No 26) $1 75 336

Contents Introduction, by A. N Lowan Properties of the function Direct interpolation. *Approximate arguments.* Inverse interpolation. Method of computation. Method of checking the tables. Bibliography of tables. Table of arctan x: x = 0(.001)7(.01)50(.1)300(1)2000(10)10000, 12D Auxiliary tables. Values of E (p) and F (p) $E_2(p) = p(1-p^2)/6$; F (p) = q $(1-q^2)/6$; $p+q=1$ Values of $\frac{1}{4}p(1-p)$ Conversion table, radians ⇄ degrees.

Note In this volume, the intervals between successive arguments are such that interpolation t 12 decimal places is possible with the aid of the second central differences, which are tabulated alongside the entries. The tables are useful in computations involving complex numbers, natural logarithms, integrals of rational functions, and related mathematics. Between the original publication in 1943 and the reissue in 1953, no errors in the functional values were reported, but several misprints in the arguments were discovered and have been corrected in the reissue

UNITED STATES WORK PROJECTS ADMINISTRATION MATHEMATICAL TABLES PROJECT

Table of circular and hyperbolic tangents and cotangents for radian arguments Prepared by the Mathematical Tables Project, Work Projects Administration of the Federal Works Agency Conducted under the sponsorship of the National Bureau of Standards Lyman J Briggs, director, National Bureau of Standards, official sponsor Arnold N Lowan, technical director, Mathematical Tables Project. New York Columbia University Press, 1943 410 p 27 cm $7 50 337

Contents: Introduction, Bibliography Table I, Circular and hyperbolic tangents and cotangents. Table I Circular and hyperbolic tangents and cotangents. Conversion tables, radians to degrees, minutes, and seconds. Values of $\frac{1}{4}p(1-p)$. Values of $1/6p(1-p^2)$ and $1/6q(1-q^2)$ Multiples of $\frac{1}{2}\pi$

Note The main table in this volume is devoted to the circular and hyperbolic tangents and cotangents for radian arguments ranging from 0 to 2 t intervals of 0.0001 Supplementary tables for all four functions over the range of 0 to 10 at intervals of 0.1 are also included. These tables form companion volume to the Work Projects Administration *Tables of circular and hyperbolic sines and cosines* New York, 1939

UNITED STATES NATIONAL BUREAU OF STANDARDS

Table of the descending exponential x–2 5 to x–10 Washington D C Government Printing Office, 1955 76 p 26 cm (National Bureau of Standards Applied mathematics series. No 46) $0 50 338

Contents Introduction. Table of the descending exponential e^{-x} x = 2.5(.001)10, 20D

Note: This booklet is a supplement to *Tables of the exponential function* e^x (Applied mathematics series. No. 14), 3rd edition, 1951 described below In the earlier volume the descending or negative exponential e^{-x} is tabulated from x = 0 to x = 2.5 t intervals of .0001 in the argument and for x = 1 to x = 100 at intervals of 1 The present table gives the values in the range x = 2.5 to x = 10 at intervals of .001 to 20 decimal places. It facilitates interpolation and provides greater accuracy than previously available in this range.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Table of the gamma function for complex arguments Washington, D C. Government Printing Office, 1954 105 p 27 cm. (United States. National Bureau of Standards. Applied mathematics series No 34) $2 00 339

Contents: Introduction, by H. E. Salzer; Purpose and scope of table. Important properties of the gamma function. Method of computation. Interpolation. Bibliography and notes. Table of log$_{10}$Γ($x+iy$), x = 0(.1)10, y = 0(.1)10, 12D. Auxiliary tables sin πx cos πx, sinh πx, cosh πx, = 0(.1)10, 15D or 15S.

Note: In both pure and applied mathematics the table of the complex gamma function is of fundamental importance, for it makes possible the cataloguing of the complex gamma function in the set of known mathematical functions. The tabulation was prompted to meet urgent and specific needs in the fields of atomic and nuclear research.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Table of hyperbolic sines and cosines x–2 to x–10 Washington D C Government Printing Office, 1955 81 p. 26 cm (National Bureau of Standards Applied mathematics series. No 45) $0 55 340

Contents: Introduction. Table of sinh x and cosh for x = 2(.001)10 9s.

Note: This table has been prepared and published as an addition to the volume entitled *Tables of circular and hyperbolic sines and cosines for radian arguments* (Applied mathematics series, No. 36), which is noted below It makes vailable the hyperbolic sines and cosines in the extended range from 2 to 10. The table was computed on the National Bureau of Standards Eastern Automatic Computer (SEAC) by W F Cahill, and the results transferred to punched cards. These cards were differenced and prepared for printing by K. C. Nelson.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Table of sine and cosine integrals for arguments from 10 to 100 Washington D C Government Printing Office, 1954 187 p. 27 cm. (National Bureau of Standards Applied mathematics series No 32) $2.25 341

Contents Introduction by A. N Lowan. Table of sine and cosine integrals $Si(x)$ and $Ci(x)$: x = 10(.01)100, 10D Auxiliary tables Multiples of $\pi/2$. Values of $1/2p(1-p)$. Values of E (p) and F (p). $E_2(p) = p(1-p^2)/6$; F (p) = $q(1-q^2)/6$; $p+q=1$.

Note The sine and cosine integrals tabulated in this volume are useful in the solution of many problems in electrical and radio engineering, such as the radiation resistance of directional antennas, of short-wave transmitters, in optical problems particularly relating to diffraction, and in other branches of physics. I the reissue, the bibliography has been brought up to date, and three new tables appear among the auxiliary tables.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Tables of Bessel functions of fractional order New York Columbia University Press, 1948–49 2 v illus 27 cm V I $7 50 v II $10 00 342

Contents (abridged) Volume Note on modified differences. Bibliography Constants. Tables of J ( ). Tables of A ( ) nd $B_\nu(x)$ [25(1)50(1)300(10)3,000(100)10 000(200)30,000; 10D]. *Zeros of* $J_\nu(x)$. Tables of sines and cosines. Everett s interpolation coefficients. *Multiples of* $\pi/2$. *Table of* $L_\nu(x)$—for interpolating in the ν-direction. Volume II Introduction. Constants. Tables of I_ν( ). Tables of $e^{-x}I$ (x). Everett interpolation coefficients. Table of $L_\nu(x)$—for interpolating in the ν-direction.

Contents: Introduction, by A. N. Lowan. Table I, Sin [illegible] and cos x, [illegible] = 0(0.0001)2, 8D. Table II, Sin [illegible] and cos x, [illegible] = 0(.0001)1.5, 15D. Table III, Sin [illegible] and cos x, [illegible] × 10⁻⁹ [illegible] = 1(1)9, [illegible] = 1(1)10, 15D. Table IV, Sin [illegible] and cos x, [illegible] = 0(.00001)0.01000, 15D. Supplementary tables: Table [illegible] Conversion table. Degrees, minutes, second and radians. Table VI. Values of [illegible](1 − [illegible]), [illegible] = 0(.001)1, exact.

Note: This work is [illegible] reissue, with [illegible] new preface and minor corrections and minor changes, of *Mathematical table MT 4*, originally published in 1940, compiled by the New York Mathematical Tables Project, the predecessor of the Computation Laboratory of the National Bureau of Standards. The tables, consisting mainly of sines and cosines of angles expressed in radian argument, bring together in one place all such previous tables corrected to at least eight decimal places. The tables are of value in their application to the asymptotic expansion of transcendental functions, in machine and other computations.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Tables of spherical Bessel functions. Prepared by the Mathematical Tables Project, National Bureau of Standards. New York Columbia University Press, 1947 2 v 27 cm. $7.50 per vol. 355

Contents (abridged): [illegible]

Note: The above volumes represent the continuation of [illegible] project begun in 1938 by the Work Projects Administration of the City of New York, and taken over by the United States National Bureau of Standards in 1943. Their purpose is to provide tabulations of mathematical functions which are of fundamental importance in pure and applied mathematics. They are of particular value to physicists and engineers concerned with the solution of complex problems relating to wave motion, analysis of atomic and molecular structure, electricity, heat conduction, hydrodynamics, etc. Each volume describes how the tables were computed, methods of use, and methods of interpolation. In the tables of contents the figures in the square brackets denote the range, the interval between consecutive arguments, and the number of decimal places or significant figures in the tabulated entries.

UNITED STATES. WORK PROJECTS ADMINISTRATION MATHEMATICAL TABLES PROJECT

Tables of Lagrangian interpolation coefficients. Prepared by the Mathematical Tables Project, Work Projects Administration of the Federal Works Agency. Conducted under the sponsorship of the National Bureau of Standards. Lyman J Briggs, director National Bureau of Standards official sponsor Arnold N Lowan, technical director Mathematical Tables Project. New York Columbia University Press, 1944 392 p. 27 cm. $7.50 356

Note: This reference volume extends the few existing tables of Lagrangian interpolation coefficients in polynomials of degree [illegible] for [illegible] 3, 4, [illegible] 11, by giving the entries at smaller intervals of the argument and by making adequate provisions for interpolation near the beginning and the end of the table. The first nine tables give the coefficients for the argument *p* in decimal form corresponding to [illegible] 3, 4 [illegible] 11. Table [illegible] gives interpolants for *p* at intervals of 0.1 for [illegible] 3, [illegible] 8. Table [illegible] contains the [illegible] coefficients for [illegible] 3, 4, [illegible] 8 for *p* in multiples of 1/12. [illegible] coefficients for [illegible] = 3, 4, [illegible] 11 are tabulated in table [illegible], and [illegible] of these coefficients together with further formulas is also included.

USPENSKY, JAMES VICTOR

Theory of equations. New York McGraw Hill Book Company Inc., 1948 353 p. illus. 24 cm. $5.50. 357

Contents: Complex numbers. Polynomials in one variable. Algebraic equations and their roots. Limits of roots—rational roots. Cubic and biquadratic equations. Separation of roots. The theorem of Sturm. Approximate evaluation of roots. Determinants and matrices. Solution of linear equations by determinants—some applications [illegible] determinants to geometry. Symmetric functions. Elimination. Appendices: The fundamental theorem [illegible] algebra. On the theorem of Vincent. On equations [illegible] roots have negative real part. Iterative solution of the frequency equation. Graeffe's method. Answers. Index.

Note: A distinguishing feature of this book is the fullness of the exposition. The method of separating real roots that is presented in the sixth chapter was originated by the author.

VON NEUMANN, JOHN

Functional operators. Princeton Princeton University Press, 1950 2 v 26 cm. (Annals of mathematics studies edited by Emil Artin and Marston Morse Vol. 21–22) $3.50 per vol. 358

Contents: Volume I, Measures and integrals: Point set theory. Outer measure. Measure. Inner measure. Invariance of measure under transformation. Covering theorems. Non-measurable sets. Lebesgue integral. Measurable functions. General measure functions and outer measures. Properties of the general integral. Volume II, The geometry of orthogonal spaces: Linear spaces. Linear operators. Commutativity. Reducibility.

Note: A notable contribution to operator theory. It is based on lectures that were given at the Institute for Advanced Study in the years 1933–34 and 1934–35 and is addressed to professional mathematicians and to other scientists with extensive mathematical experience.

WALL, HUBERT STANLEY

Analytic theory of continued fractions. Princeton D Van Nostrand Company Inc., 1948. 433 p. illus. 24 cm. (The university series in higher mathematics M H. Stone chairman, editorial board) $9.50 359

Contents: Part I, Convergence theory: The continued fraction as product of linear fractional transformations. Convergence theorems. Convergence of continued fractions whose partial denominators are equal to unity. Introduction to the theory of positive definite continued fractions. Some general convergence theorems. Stieltjes type continued fractions. Extensions of the parabola theorem. The value region problem. Part II, Function theory: J-fraction expansions for rational functions. Theory of equations. J-fraction expansions for power series. Matrix theory of continued fractions. Continued fractions and definite integrals. The moment problem for [illegible] finite interval. Bounded analytic functions. Hausdorff summability. The moment problem for an infinite interval. The continued fraction of Gauss. Stieltjes summability. The Padé table. Bibliography. Index.

Note: An important contribution to the theory of continued fractions. The author has endeavored to combine the results obtained by himself and earlier writers in the field, including Stieltjes, Van Vleck and Pringsheim, into [illegible] unified theory and to develop the theory as part of [illegible] larger analytical structure obtained by regarding the continued fraction as generated by an infinite sequence of linear fractional transformations in [illegible] single variable, and also as arising from [illegible] single linear transformation in infinitely many variables. The book is organized as [illegible] textbook, but it is of interest to any mathematician working in this field. A knowledge of elementary function theory is presupposed.

WALSH, JOSEPH LEONARD

The location of critical points of analytic and harmonic functions. New York American Mathematical Society 1950 384 p. 26 cm. (American Mathematical Society Colloquium publications. Vol. XXXIV) $6.00. 360

corrected in the tables. One of the supplementary tables has been expanded in the new edition. A supplement is published under the title, *Table of hyperbolic sines and cosines* (Applied mathematics series No. 45) and is noted above.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Tables of the exponential function e^x, prepared by National Bureau of Standards Computation Laboratory Issued June 29, 1951 (supersedes MT2, second edition) Washington, D C Government Printing Office, 1951 537 p 27 cm. (United States. National Bureau of Standards Applied mathematics series 14) $3 75 349

Contents: Introduction. Bibliographic notes. Ascending exponentials [0.0000(0.0001)1.0000; 18D]. Ascending exponentials [1.0000(0.0001)2.5000; 15D]. *Ascending exponentials* [2.500(0.001)5.000; 15D]. Ascending exponentials [5.00(0.01)10.00; 12D]. Descending exponentials [0.0000(0.0001)2.5000; 18D]. Ascending and descending exponentials [0.000000(.000001)0.000100; 18D]. Ascending and descending exponentials [1(1)100; 19S]. Ascending and descending exponentials at decimal intervals from $1 \times 10_{-10}$ to $9 \times 10_{-1}$; 18D. Values of and 1 ; 2556D

Note: The third edition of set of tables useful to a range of computations in mechanics, the kinetic theory of matter quantum mechanics, electricity magnetism, statistical mechanics, chemical kinetics, theory of probability or mathematical statistics. The work is for the most part a page-for page reproduction of the tables given in the first and second editions. In this edition several misprints have been corrected, and the values of and of 1 to 2556 decimal places have been added.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Tables of functions and of zeros of functions Collected short tables of the National Bureau of Standards Computation Laboratory Washington, D C. Government Printing Office 1954 211 p 27 cm (National Bureau of Standards Applied mathematics series. No 37) $2.25 350

Contents Introduction, by A. N Lowan. Table of functions On the function $H(m,a,x) = \exp(-ix) F(m+1-ia,2m+2,2ix)$ by A. N Lowan and W Horenstein. T bles of the integrals $\int e^t J(t)dt$ and $\int e^t Y(t)dt$, by A. N Lowan and M Abramowitz. Table of $Ji_0(x) = \int^\infty [J(t)/t]dt$ and related functions, by A. N Lowan and others. Table of $f(x) = (x/2)^{-n} J(x)$. The functions of $K_n(x) = \int^\infty e^{-x \cosh t} dt$ by G. Placzek. Table of the Struve functions $L_\nu(x)$ and $H_\nu(x)$ Table of Fourier coefficients, by A. N Lowan and J Laderman. Table of sines and cosines for radian arguments between 100 and 1,000 Radix tables for finding logarithms to 25 decimal places, by H. E. Salzer Table of $e^x/$ 1. Table of zeros of functions Table of the zeros of the Legendre polynomials of Order 1–16 and the weight coefficients for Gauss' mechanical quadrature formula, by A. N Lowan and others. Table of the zeros and weight factors of the first fifteen Laguerre polynomials, by H. E. Salzer and R. Zucker A short table of the first five zeros of the transcendental equation $J_0(x)Y(kx) - J(kx)Y(x) = 0$, by A. N Lowan and A. Hillman. Zeros of certain Bessel functions of fractional order by M. Abramowitz. More zeros of certain Bessel functions of fractional order Zeros of the derivative of Bessel functions of fractional order by H. E. Salzer Complex zeros of $Y(x)$ $Y'(x)$ and $Y''(x)$ by A. Hillman and J Sherman. Roots of sin = x, by A. P Hillman and H. E. Salzer

Note This volume brings together 18 short tables of functions and of zeros of functions. Fifteen are reprinted from various journals and other publications, and three of them are here published for the first time. It is the first of certain projected numbers in the Applied mathematics series t bear the subtitle, *Collected short tables of the National Bureau of Standards Computation Laboratory*.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Tables of Lagrangian coefficients for sexagesimal interpolation. Washington, D C. Government Printing Office, 1954 157 p 27 cm. (United States. National Bureau of Standards Applied mathematics series 35) $2 00 351

Contents: Introduction, by H. E. Salzer: Scope of the tables. Illustrations of use of coefficients A_i. Use of coefficients A near beginning or end of table. Use of coefficients A in tables having differences. Method of computation. Table 1 Three-point interpolation coefficients. Table 2. Four-point interpolation coefficients. Table 3 Five point interpolation coefficients. Table 4. Six-point interpolation coefficients.

Note Other tables of Lagrangian interpolation coefficients are intended for use with decimal subdivisions of the argument. The tables in this collection make the convenience of Lagrangian interpolation readily available in situations involving interpolation in tables in which the arguments are expressed in sexagesimal measure, e. g., angles (or time) in degrees (hours), minutes, and seconds.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Tables relating to Mathieu functions, characteristic values, coefficients, and joining factors. Prepared by the Computation Laboratory of the National Applied Mathematics Laboratories, National Bureau of Standards. New York Columbia University Press, 1951 278 p illus 27 cm $8.00 352

Contents Introduction. Graphs of be (s) and bo(s). Bibliography Constants. Table of characteristic values be(s). Table of characteristic values bo(s). Table of coefficients De(s). Table of coefficients Do(s). Table of joining factors. Values and $E_e(p)$ and $F(p)$. $p = [0(.001)1; 7D]$. Values of $\frac{1}{2}p(1-p)$. Sines and cosines [0(1°)90°]. Multiples of $\frac{1}{2}\pi$.

Note A reference book of tables compiled by the laboratory mentioned in the book' title. The tables are considerably more comprehensive than those vailable hitherto.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Table of secants and cosecants to nine significant figures at hundredths of a degree. Washington, D C. Government Printing Office, 1954 46 p 26 cm. (National Bureau of Standards Applied mathematics series. No 40) $0.35 353

Contents: Introduction, by M. Abramowitz. Table of secants and cosecants.

Note This table of secants and cosecants was computed in 1948 on punched-card equipment in connection with the preparation of certain navigation tables. The table was suggested and its computation planned by M. Abramowitz. The punched-card computations were performed under the direction of A. H. Rosenthal. The preparation and checking of the final manuscript was done by K. C. Nelson. Publication was prompted by new demand for many-figure tables of the trigonometric functions with argument in decimal division of degree. The table is an outgrowth of and supplement to U S. National Bureau of Standards. Applied mathematics series 5 entitled *Tables of sines and cosines to fifteen decimal places at hundredths of degree.*

UNITED STATES NATIONAL BUREAU OF STANDARDS

Tables of sines and cosines for radian arguments Washington, D C. Government Printing Office, 1955 278 p. 27 cm (National Bureau of Standards Applied mathematics series. No 43) $3.00 354

WYLIE, C. R., JR.
Calculus. New York McGraw Hill Book Company Inc., 1953 565 p. 24 cm. $6.50 367

Contents: The calculus in perspective. Limits and continuity. Formal differentiation. Geometrical applications of differentiation. The theory of integration. Integration by formula. Formal integration by special devices. Related rates and motion. Geometrical applications of integration. Physical applications of integration. Hyperbolic functions. Partial differentiation. Infinite series. The expansion of functions. Multiple integration. Differential equations. Appendixes. Glossary. Index.

Note: A textbook designed for use in introductory college courses. Much material from physics and engineering is introduced, particularly in the exercises, however, considerable degree of mathematical rigor has been maintained. The author is Chairman of the Department of Mathematics in the University of Utah.

WYLIE, C. R., JR.
Plane trigonometry New York McGraw Hill Book Company Inc., 1955 381 p. illus. 23 cm. $4.00 368

Contents: The six trigonometric functions. Elementary identities and reduction formulas. The solution of right triangles. The graphs of the trigonometric functions. Functions of composite angles. The inverse trigonometric functions. Trigonometric equations. Logarithms. The solution of oblique triangles. Complex numbers and de Moivre's theorem. Trigonometric series. Hyperbolic functions. Appendix. Answers to odd numbered exercises. Index.

Note: A college-level treatment of plane trigonometry written by the Chairman of the Department of Mathematics of the University of Utah. Although the treatment is primarily geometric, the book is designed as preparation for courses in analytic geometry, calculus, etc., and the nature of plane trigonometry as an area of mathematical analysis is made clear. Some advanced topics are taken up in the latter chapters of the book. A [illegible]-page section of tables includes tables of powers and roots, natural trigonometric functions, logarithms of numbers and logarithms of trigonometric functions, exponential and hyperbolic functions, etc.

YOUNG, JOHN WESLEY
Projective geometry Chicago Published for the Mathematical Association of America by the Open Court Publishing Company 1930. 185 p. illus. 19 cm. (The Carus mathematical monographs. No. 4) $3.00 369

Contents: Introductory concepts. Projective space, the principle of duality. Desargues' theorem, harmonic sets. Projectivities in one-dimensional forms, the fundamental theorem. The Pascal and Brianchon theorems. Metric properties. Groups of projective transformations. The algebra of points and the introduction of analytic methods. Groups and geometries. Index.

Note: In the first five chapters of this introductory work, the author has provided a systematic and elementary treatment of fundamental propositions, culminating in the theorems of Pascal and Brianchon and the polar system of a conic. The remaining chapters deal with the relation of the subject to metric geometries and lay the foundations for the reader's use of analytic methods.

ZYGMUND, ANTONI, AND OTHERS
Contributions to Fourier analysis. By A. Zygmund, W. Transue, M. Morse, A. P. Calderón, and S. Bochner. Princeton Princeton University Press, 1950 191 p. 26 cm. (Annals of mathematics studies. No. 25) $3.00. 370

Contents: Localization of best approximation, by S. Bochner. Dirichlet problem for domains bounded by spheres, by S. Bochner. The Fréchet variation and Pringsheim convergence of double Fourier series, by M. Morse and W. Transue. Kernels of distribution functions associated with bimeasure functionals, by M. Morse and W. Transue. Note on the boundary values of functions of several complex variables, by A. P. Calderón and A. Zygmund. On the theorem of Hausdorff-Young and its extensions, by A. P. Calderón and A. Zygmund.

Note: The original papers named above are presented in this volume.

PROBABILITY

BOCHNER, SALOMON
Harmonic analysis and the theory of probability. Berkeley and Los Angeles University of California Press 1955 176 p. 22 cm. (California monographs in mathematical science board of editors Griffith C. Evans and others) $4.50 371

Contents: Approximations. Fourier expansions. Classes properties of Fourier transforms. Laplace and Mellin transforms. Stochastic processes and characteristic functionals. Analysis of stochastic processes. Notes and references. Index.

Note: The special value of this tract lies in its content of largely original work. Some of it has appeared in papers published elsewhere by the author, but much of it is here published for the first time. There are two topics, Fourier analysis and the theory of probability. The topics of the latter class are mostly applications of Fourier analysis. The "Notes and references" is a chapter-by-chapter arrangement of bibliographical citations and author notes, some of which are critical, some historical, in nature.

FELLER, WILLIAM
An introduction to probability theory and its applications. Volume one New York John Wiley & Sons, Inc., 1950 419 p. illus. 23 cm. (Wiley mathematical statistics series Walter A. Shewhart, editor) 372

Contents: Introduction. The nature of probability theory. The sample space. Elements of combinatorial analysis. Stirling's formula. The simplest occupancy and ordering problems. Combination of events. Conditional probability, statistical independence. The binomial and the Poisson distributions. The normal approximation to the binomial distribution. Unlimited sequences of Bernoulli trials. Random variables—expectation. Laws of large numbers. Integral valued variables—generating functions. Recurrent events—theory. Applications to runs and renewal theory. Random walk and ruin problems. Markov chains. Algebraic treatment of finite Markov chains. The simplest time-dependent stochastic processes. Answers to problems. Index.

Note: In this work probability theory is presented rigorously as a branch of mathematics. The discussions are confined to mathematical concepts, and theorems are proved. However, in order to increase the book's usefulness, material on practical applications has been inserted in various places and is distinctively marked so that readers who are interested only in the mathematical exposition can skip it. As the chapter titles indicate, elementary subjects are considered first, but rather advanced ones are taken up in the last chapters. The work is designed for use as a textbook in advanced college courses, but is also of interest to other persons in need of a grasp of probability. A second edition was published in 1957 461 p. $10.75.

GUMBEL, E. J. editor
Probability tables for the analysis of extreme value data. Washington D. C. Government Printing Office 1953 32 p. 26 cm. (United States. National Bureau of Standards. Applied mathematics series. No 22) $0.25 373

Contents: Introduction, by E. J. Gumbel. Explanation and use of the tables. List of functions tabulated. History of the tables. Method of computation. Interpolation. Symbols. Bibliography. Table 1. Cumulative probability function and density function of extremes. Table 2. Inverse of the cumulative probability function of extremes. Table 3. Probability density of extremes as a function of the cumulative probability. Table 4. Probability points x_n for nth extremes. Table 5. Cumulative probability function Ψ and density function ψ for the reduced range R. Table 6. Reduced range R as function of the cumulative probability Ψ.

Note: The need for the six tables published in this booklet arose from scientific and engineering problems depending on extreme-value data, such as the study of floods, droughts, extreme temperatures, extreme rainfalls, and the fracturing of metals, textiles, and other materials, under applied force, where the observed strength is determined by the weakest link. When it is recognized that these

Contents Fundamental results. Real polynomials. Rational functions. Rational functions with symmetry Analytic functions. Green's functions. Harmonic functions. Bibliography Index.

Note A classical problem is the study f the location of the zeros of the derivative (that is, the critical points) of polynomial $p( )$ relativ to the zeros (assumed given) of $p( )$ itself This book is concerned with the geometric problem in the plane f the complex variable, the determination of point sets depending on the zeros of $p( )$ which contain all critical points of $p(z)$ point sets preferably bounded by easily constructed lines, circles, and conics the book does not deal with the enumeration of critical points in an arbitrary region. The original theory was developed by *Gauss*, Lucas, *Laguerre*, Jensen, and others, was extended by Bocher to include the critical points of rational functions, and now the present comprehensive unified theory includes polynomials, rational functions, periodic functions, Green's functions, harmonic measure and various other harmonic functions. Cases in which symmetry occurs are emphasized. Many of the methods are elementary and require no previous knowledge of the topic. The results are presented in a form convenient for reference, and are of *significance* in connection with conformal mapping, level curves of analytic and harmonic *functions*, *extremal* polynomials, extremal problems in analytic functions, potential theory and hydrodynamics.

WALSH, JOSEPH LEONARD

Interpolation and approximation by rational functions in the complex domain New York American Mathematical Society, 1935 382 p illus 26 cm (American Mathematical Society Colloquium publications Vol xx) $7 00 361

Content Possibility of approximation analytic functions. Interpolation and lemniscates. Degree of convergence f polynomials. Overconvergence. Best approximation by polynomials. Orthogonality and least squares. Interpolation by polynomials. Interpolation by rational functions. Approximation by rational functions. Interpolation and functions analytic in the unit circle. Approximation with auxiliary conditions and to non-analytic functions. Existence and uniqueness of rational functions of best approximation. Bibliography Index.

Not This book deals primarily with infinite sequences or series ▪ polynomials and rational functions converging toward given analytic function and fulfilling certain additional conditions. The conditions are characterized either by the coincidence of the polynomial or rational function with the given analytic function in proper points (problem of interpolation) or lying close to it as possible (problem of approximation) The connection between the interpolative and approximate properties ▪ investigated.

WEINSTOCK, ROBERT

Calculus of variations, with applications to physics and engineering New York Mc Graw Hill Book Company, Inc 1952 326 p illus 24 cm. (International series in pure and applied mathematics William Ted Martin consulting editor) $6 50 362

Contents Introduction. Background preliminaries. Introductory problems. Isoperimetric problems. Geometrical optics—*Fermat'* principle. Dynamics f particles. Two independent variables—the vibrating string. The Sturm-Liouville eigenvalue-eigenfunction problem. Several independent variables—the vibrating membrane. *Theory of elasticity* Quantum mechanics *Electrostatics. Bibliography* Index.

Note. The calculus of variations is usually treated as an area f pure mathematics. Howev er it has wide applications in physics and engineering. This introductory book is devoted primarily to the basic concepts and techniques, but the examples that are worked out in the exposition and the problems that are included for the student to solv usually pertain to physics or engineering. For readers who are familiar with differential and integral calculus and basic physics, including the elements of modern physics.

WIDDER, DAVID VERNON

Advanced calculus. New York Prentice Hall, Inc., 1947 432 p illus 24 cm $6 50 363

Contents Partial differentiation. Vectors. Differential geometry Applications of partial differentiation. Stieltjes integral. Multiple integrals. Line and surface integrals. Limits and indeterminat forms. Infinite series. Convergence f improper integrals. The gamma function evaluation of definite integrals. Fourier series. The Laplace transform. Applications of the Laplace transform. Index of symbols. Index.

Note Manipulative problems with which the student is already familiar are treated first in this textbook, and these are followed gradually by discussions of calculus theory Each section consists of definitions, theorems, proofs, examples, and exercises an unusual feature is the inclusion of material dealing with the Stieltjes integral and the Laplace transform. Although there is more subject matter than can ordinarily be accommodated in standard two-semester college course, the relative independence of each chapter enables the book to be used with variety of advanced mathematics courses, several f which ar suggested by the author Mathematical maturity equivalent to that obtained from three or four semesters' work in elementary calculus, is required of the reader. The author is Professor of Mathematics at Harvard University

WIDDER, DAVID VERNON

The Laplace transform Princeton Princeton University Press 1941 406 p 23 cm. (Princeton mathematical series. 6) $7.50 364

Contents The Stieltjes integral. Fundamental formulas. The moment problem. Absolutely and completely monotonic functions Tauberian theorems. The bilateral Laplace transform. Inversion and representation problems for the Laplace transform. The Stieltjes transform. Bibliography Index.

Note. This book is designed for the student of advanced mathematics who has working knowledge of the theory of one complex and of one real variable, and who is particularly interested in analysis. The material on the Stieltjes integral, as well as that on the Stieltjes transform and on completely monotonic functions, has not hitherto appeared in book form. Several proofs of the prime number theorem are included, to introduce one of the most elegant illustrations f the analytic method. Effort has been made to insure that the book is complete in itself, and proofs have been included of results with which the student might not be familiar

WIENER, NORBERT

The Fourier integral and certain of its applications. New York Dover Publications Inc., 1954 201 p 21 cm. $3 95 365

Contents Introduction. Plancherel's theorem. The general Tauberian theorem. Special Tauberian theorems. Generalized harmonic analysis. Bibliography

Note: This book had its origin in course of lectures which the author gave at the University of Cambridge during the Lent Term of 1932 and it was first published in 1933. It was immediately recognized as an important publication, because it demonstrated the utility of the Fourier integral in mathematical analysis and certain areas of applied mathematics. Also, it contains ideas that were later more fully developed in the author's landmark, *Cybernetics* This edition is reprint without changes in the text.

WOODS, ROSCOE

Analytic geometry Revised edition. New York The Macmillan Company 1948 322 p illus 22 cm. $4 00 366

Contents. Part I, Plane analytic geometry: Fundamental concepts and formulas. The line. The circle. The parabola. The ellipse. The hyperbola. Transformation of coordinates. *Geometric properties* of locus Polar coordinates. Parametric equations. *Simple geometric* properties and constructions of conics. The second degree equation in rectangular coordinates. *Part II*, Solid analytic geometry: Fundamental concepts and formulas. The plane and the line. Surfaces and curves. Answers t *odd-numbered exercises.* Index.

Note. The first 10 chapters of this text are intended to contain all the material normally covered in short introductory course in analytic geometry. The remaining five chapters, which include the basic principle *of analytic geometry* of space, are designed for longer college courses. Minor revisions have been made in this edition, and some topics are explained at greater length, but the general scope and arrangement remain the same as in the 1939 edition.

Wylie C. R., jr.
Calculus. New York McGraw Hill Book Company Inc. 1953 565 p 24 cm. $6.50 367

Contents: The calculus in prospect. Limits and continuity. Formal differentiation. Geometrical applications of differentiation. The theory of integration. Integration by formula. Formal integration by special devices. Related rates and motion. Geometrical applications of integration. Physical applications of integration. Hyperbolic functions. Partial differentiation. Infinite series. The expansion of functions. Multiple integration. Differential equations. Appendices. Glossary. Index.

Note: A textbook designed for use in introductory college courses. Much material from physics and engineering is introduced, particularly in the exercises; however, a considerable degree of mathematical rigor has been maintained. The author is Chairman of the Department of Mathematics in the University of Utah.

Wylie C. R., jr.
Plane trigonometry New York McGraw Hill Book Company Inc., 1955 381 p. illus. 23 cm. $4.00. 368

Contents: The six trigonometric functions. Elementary identities and reduction formulas. The solution of right triangles. The graphs of the trigonometric functions. Functions of composite angles. The inverse trigonometric functions. Trigonometric equations. Logarithms. The solution of oblique triangles. Complex numbers and de Moivre's theorem. Trigonometric series. Hyperbolic functions. Appendix. Answers to odd-numbered exercises. Index.

Note: A college-level textbook of plane trigonometry written by the Chairman of the Department of Mathematics of the University of Utah. Although the treatment is primarily geometric, the book is designed as preparation for courses in analytic geometry, calculus, etc., and the nature of plane trigonometry as an area of mathematical analysis is made clear. Some advanced topics are taken up in the latter chapters of the book. A 70-page section of tables includes tables of powers and roots, natural trigonometric functions, logarithms of numbers and logarithms of trigonometric functions, exponential and hyperbolic functions, etc.

Young John Wesley
Projective geometry Chicago Published for the Mathematical Association of America by the Open Court Publishing Company 1930 185 p. illus. 19 cm. (The Carus mathematical monographs. No. 4) $3 00 369

Contents: Introductory concepts. Projective spaces, the principle of duality. Desargues' theorem, harmonic sets. Projectivities in one-dimensional forms, the fundamental theorem. The Pascal and Brianchon theorems. Metric properties. Groups of projective transformations. The algebra of points and the introduction of analytic methods. Groups and geometries. Index.

Note: In the first five chapters of this introductory work, the author has provided a systematic and elementary treatment of fundamental propositions, culminating in the theorems of Pascal and Brianchon and the polar system of a conic. The remaining chapters deal with the relations of the subject to metric geometries and lay the foundations for the reader's use of analytic methods.

Note: The special value of this tract lies in its content of largely original work. Some of it has appeared in papers published elsewhere by the author but much of it is here published for the first time. There are two topics, Fourier analysis and the theory of probability. The topics of the latter class are mostly applications of Fourier analysis. The "Notes and references" is a chapter-by-chapter arrangement of bibliographical citations and author's notes, some of which are critical, some historical, in nature.

Feller William
An introduction to probability theory and its applications. Volume one. New York John Wiley & Sons, Inc., 1950 419 p. illus 23 cm. (Wiley mathematical statistics series Walter A. Shewhart editor) 372

Contents: Introduction. The nature of probability theory. The sample space. Elements of combinatorial analysis. Stirling's formula. The classical occupancy and ordering problems. Combination of events. Conditional probability, statistical independence. The binomial and the Poisson distributions. The normal approximation to the binomial distribution. Unlimited sequences of Bernoulli trials. Random variables—expectation. Laws of large numbers. Integral valued variables—generating functions. Recurrent events—theory. Applications to runs and renewal theory. Random walk and ruin problems. Markov chains. Algebraic treatment of finite Markov chains. The simplest time-dependent stochastic processes. Answers to problems. Index.

Note: In this work probability theory is presented rigorously as a branch of mathematics. The discussions are confined to mathematical concepts, and theorems are proved. However, in order to increase the book's usefulness, material on practical applications has been inserted in various places and is distinctively marked so that readers who are interested only in the mathematical exposition can skip it. As the chapter titles indicate, elementary subjects are considered first, but rather advanced ones are taken up in the last chapters. The work is designed for use as a textbook in advanced college courses, but is also of interest to other persons in need of [illegible] of probability. A second edition was published in 1957 461 p., $10.75.

Gumbel, E. J., editor
Probability tables for the analysis of extreme-value data. Washington, D C. Government Printing Office, 1953 32 p 26 cm. (United States. National Bureau of Standards. Applied mathematics series. No. 22) $0.25 373

Contents: Introduction, by E. J. Gumbel. Explanation and use of the tables. List of functions tabulated. History of the tables. Method of computation. Interpolation. Symbols. Bibliography. Table 1. Cumulative probability function and density function of extremes. Table 2. Inverse of the cumulative probability function of extremes. Table 3. Probability density of extremes as a function of the cumulative probability. Table 4. Probability points y_n for with extremes. Table 5. Cumulative probability function Φ and density function ϕ for the reduced range R. Table 6. Reduced range R as function of the cumulative probability Φ.

Note: The need for the six tables published in this booklet arose from scientific and engineering problems depending on extreme-value data, such as the study of floods, droughts, extreme temperatures, extreme rainfalls, and the fracturing of metals, textiles, and other materials under applied force, where the observed strength is determined by the weakest link. When it is recognized that these

phenomena are of a statistical nature, the solution of some of the problems connected with them is furnished by the asymptotic theory of extreme values of a statistical variable an explanation of which is found in the introduction to these tables. Three of the tables are based upon unpublished manuscripts of J Arthur Greenwood; one was prepared from an unpublished table computed by the Computation and Ballistics Laboratory Naval Proving Ground, Dahlgren, Virginia; fifth extends table by E. J Gumbel; and the sixth table was computed by the Computation Laboratory of the N tional Bureau of Standards, where all the tables were checked, edited, and prepared for publication.

HARVARD UNIVERSITY COMPUTATION LAB ORATORY

Tables of the cumulative binomial probability distribution By the staff of the Com putation Laboratory Cambridge Mass Har vard University Press, 1955 503 p 27 cm. (Harvard University Computation Labora tory Annals Vol xxxv) $8 00 374

Contents The cumulative binomial probability distribution. Preparation of the tables. Interpolation. Applications. Tables of the cumulative binomial $E(n,r,p) = \sum c_{n}p^{s}(1-p)^{n-s}$ for $= 0(1)n$ $n = 1(1)50(2)100(10)200(20)500(50)1000$. Appendix.

Note The tables in this volume provide computed values for the binomial probability distribution over a much more extensive range than had been tabulated up to the date of its publication. Intervals for p in Table I are 0.01 0.02, 0.03, 0.04 0.05 0.06 1/16 0.07 0.08 and 1/12; in Table II intervals for p are 0.09 0.10 0.11 0.12, 1/8 0.13, 0.14 0.15, 0.16, and 1/6; in Table III, 0.17 0.18, 3/16 0.19 0.20, 0.21 0.22, 0.23, 0.24, 0.25; in Table IV 0.26, 0.27 0.28, 0.29 0.30, 0.31 5/16 0.32, 0.33, and 1/3; in Table V 0.34 0.35 0.36 0.37 3/8 0.38, 0.39 0.40 0.41 and 5/12; in Table VI, 0.42, 0.43 7/16 0.44, 0.45 0.46, 0.47 0.48, 0.49 0.50. The computations were made on Harvard University s Mark IV calculator and the tables are reproduced from typed copy made by the Mark IV typewriters, thus voiding the possibility of error in the usual methods of typesetting. The second part of the introduction contains critical review of other vailable tabulations of the binomial probability distribution. A notable feature of the volume is the inclusion of comprehensive survey of applications, written by Professor Frederick Mosteller

LOÈVE, MICHEL

Probability theory Foundations Random sequences. Princeton D Van Nostrand Com pany, Inc , 1955 515 p 24 cm. $12 75 375

Contents. Introductory part—elementary probability theory Intuitive background. Axioms independence and the Bernoulli case. Dependence and chains. Part I, Notions of measure theory Sets, spaces, and measures. Sets, classes and functions. Measurable functions and integration. Part II, General concepts and tools of probability theory Probability concepts. Distribution functions and characteristic functions. Part III, Independence Sums of independent random variables. Central limit problem. Part IV Dependence Conditioning. From independence to dependence. Ergodic theorems. Second order properties. Bibliography Index.

Note A comprehensive, scholarly and up-to-date presentation of both the basic and advanced concepts of probability theory The author Professor of Mathematics at the University of California, is writing primarily for graduate students with a knowledge of mathematics through calculus. However an introductory section is included in which the subject is treated without the use of advanced mathematics, and which is suitable for use in undergraduate courses. The book is also designed as a reference tool for workers in the fields of probability and statistics. A selected bibliography of more than 40 references is included.

NEYMAN, JERZY

Contents Introduction Scope of the theory of probability and statistics. Probability Probabilistic problems in genetics. Random variables and frequency distributions. Elements of the theory of testing statistical hypotheses. Appendix: Tables of the normal integral. Index f names. Index of terms.

Note. A college text designed to meet the needs of two types of students—those who study the subject as general education course and those planning to specialize in the subject or its fields of application. Most of the content is elementary and the treatment presumes only knowledge of high school mathematics. However some advanced material is included, which can be used or omitted at the instructor' discretion. The author is associated with the Statistical Laboratory of the University of California.

REICHENBACH, HANS

The theory of probability, an inquiry into the logical and mathematical foundations of the calculus of probability Second edition English translation by Ernest H Hutten and Maria Reichenbach. Berkeley and Los Angeles University of California Press, 1949 492 p illus 24 cm $12 50 377

Contents Introductory considerations. Introduction to symbolic logic. Elementary calculus f probability Theory of the order of probability sequences. Probability sequences with coordinated amounts. Continuous extensions of the concept of probability sequence. The frequency properties of probability sequences. Theory f probabilities of a higher level. The problem of application. Probability logic. Induction. Index.

Note The first English-language edition of notable work which appeared first as *Wahrscheinlichkeitslehre*, 1935 It presents a comprehensive system f probability based upon mathematical, philosophical, and logical methods of reasoning. One of the key notions is the replacement of classical induction by statistical induction which leads to predictions about sequences of events rather than individual events. The theory is important not only in mathematics but also in modern physics. In comparison to the original edition, this one embodies many revisions and rearrangements by the author

ROMIG, HARRY G

50–100 binomial tables New York John Wiley & Sons Inc., 1953 172 p 21 cm. (Wiley publications in statistics Walter A. Shewhart, editor) $4 25 378

Contents Introduction The binomial, general and restricted forms. Related distributions covered by these tables over a limited range. Notation for binomial. Description of these tables. Directions for use of these tables. Interpolation. References. 50–100 binomial tables: Individual terms and cumulative values. $= 50$ to 100, inclusive, in steps of 5 $p = .01$ to .50, inclusive in steps of .01

Note A reference book of tables in which are given the probabilities of 0, 1 2 occurrences in n independent trials of an event whose probability f occurrence in single trial is p It is complementary to the tables in United States National Bureau f Standards, *Tables f the binomial probability distribution* Washington, 1950 (Applied mathematics series, No. 6) which gives values for from 2 to 49 The tables which occupy 172 pages, are preceded by 27-page introduction covering their method of compilation and directions for their use and including list of references.

UNITED STATES ARMY ORDNANCE CORPS BALLISTIC RESEARCH LABORATORIES, ABER DEEN PROVING GROUND, MARYLAND COM PUTING LABORATORY

Tables of the cumulative binomial probabilities Edited by Leslie E Simon and Frank E Grubbs Washington D C Government Printing Office, 1953 577 p. 30 cm. United States Army Ordnance Corps. Ordnance Corps pamphlet ORDP 20–1) $6 00 (Order from the Office of Technical Services, Department of Commerce, Washington 25, D C) 379

Contents Introduction. Bibliography Tables.

Note Useful both in the theory of probability and in its applications, these tables had their origin in computations connected with the solution of certain military problems and have been published in

of practical value to scientists in general. Only the cumulative binomial probability for single changes of 0.1 or less is tabulated. Procedures for obtaining the probability values for the range 0.1 to 1.0 from the tabulated values of the lower half are explained in the introduction. The tabulation was carried out on IBM Relay Computers at the Ballistic Research Laboratories, Aberdeen Proving Ground, Md.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Tables of the binomial probability distribution. Issued January 27 1950 Reprinted with corrections, October 1951 Washington, D C. Government Printing Office 1952 387 p 27 cm. (United States. National Bureau of Standards. Applied mathematics series 6) $2 75 380

Contents Introduction. Table 1 Individual terms [illegible] Table 2. Partial sums [illegible]

Note: The binomial (or Bernoulli) distribution, which gives the probability of 0, 1, 2, ... occurrences in ... independent trials of an event whose probability of occurrence in any single trial is p, is one of the most important discrete probability distributions, both in the theory of probability and in its applications, particularly in the biological sciences and engineering. The two tables tabulated to seven decimal places in this volume present this distribution in readily available form for the first time. They were prepared for restricted use in mimeographed form by ... branch of the United States Army just after the close of World War II. The present edition is ... photographic reproduction of the mimeographed tables, somewhat rearranged, with the addition of ... foreword and ... new introduction.

UNITED STATES. NATIONAL BUREAU OF STANDARDS

Tables of the error function and its derivative.

$$H(x) = \frac{2}{\sqrt{\pi}} \int_0^x e^{-\alpha^2} d\alpha \text{ and } H'(x) = \frac{2}{\sqrt{\pi}} e^{-x^2}$$

Washington, D C. Government Printing Office, 1954 302 p. 27 cm. (National Bureau of Standards. Applied mathematics series. No. 41) $3.25 381

Contents: Introduction, by A. N. Lowan. Table [illegible]. Constants.

Note: This work is ... reissue of Mathematical table 8, originally published in 194... and compiled by the New York Mathematical Tables Project, the predecessor of the Computation Laboratory of the National Bureau of Standards. The error function, or probability integral, has ... widespread application in many branches of science—from problems of refraction, the conduction of heat, and other fields of physics, to ... variety of problems in the theory of probability and mathematical statistics. In the new edition, those misprints in the earlier edition have been corrected, as noted in the preface. The companion volume under the title *Tables of normal probability functions* published as Applied mathematics series 23, is noted below.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Tables of normal probability functions

$$\frac{1}{\sqrt{2\pi}} e^{-x^2/2} \text{ and } \frac{1}{\sqrt{2\pi}} \int e^{-\alpha^2/2} d\alpha$$

(A reissue of Mathematical table 14 with corrections.) Washington, D C. Government Printing Office, 1953 344 p. 27 cm. (National Bureau of Standards. Applied mathematics series. No 23) $3.25 382

Contents: Introduction, by A. N. Lowan. Direct interpolation. The problem of approximate arguments. Inverse interpolation. The asymptotic expansion of F(x). Method of computation. Bibliography of tables. Table I, [illegible]

Note: The principal practical use of these tables in statistics is in testing the significance of ... deviation in ... normally distributed variates and in fitting normal distributions to observations. Between the original publication in 1942 and the reissue and the second edition in 1948, no errors in the functional values were reported; but several misprints in the arguments were discovered, and these corrections appeared in the second edition and also appear in this reissue. Additions to the bibliography also appear in the reissue. The companion volume under the title, *Tables of the error function and its derivative* is published as Applied mathematics series 41 and is noted above.

USPENSKY, JAMES VICTOR

Introduction to mathematical probability New York McGraw Hill Book Company Inc., 1937 411 p. illus. 23 cm. $7.50. 383

Contents: Computation of probability by direct enumeration of cases. Theorems of total and compound probability. Repeated trials. Probabilities of hypotheses and Bayes' theorem. Use of difference equations in solving problems of probability. Bernoulli' theorem. Approximate evaluation of probabilities in Bernoullian case. Further considerations on games of chance. Mathematical expectation. The law of large numbers. Application of the law of large numbers. Probabilities in continuum. The general concept of distribution. Fundamental limit theorem. Normal distribution in two dimensions. Limit theorems for sums of independent vectors. Origin of normal correlation. Distribution of certain functions of normally distributed variables. Appendices: Euler's summation formula. Stirling' formula. Some definite integrals. Method of moments and its applications. On ... Gaussian problem. Table of probability integral. Index.

Note: Written for persons ... he desire to acquire ... fundamental knowledge of the methods and results of the mathematical theory of probability. Presents ... simple yet rigorous exposition, of which about one-half deals with elementary matters easily accessible to undergraduate students, while the other half is devoted to modern and more advanced research. Many problems of varying degrees of difficulty are included, with solutions for many of them indicated or given in full.

MATHEMATICAL STATISTICS

ADAMS JOE KENNEDY

Basic statistical concepts. New York Mc Graw Hill Book Company Inc., 1955 304 p. illus. 23 cm. $5.50. 384

Contents: Finite populations and their distributions. Sampling from ... finite population. Statistical inference. Parameters and statistics. Hypergeometric and binomial distributions. Poisson distributions. Discrete distribution. Continuous distributions. Normal distributions. Chi square. "Student's" ... distributions. Bivariate distributions. F distributions and the analysis of variance. Nonparametric statistics. Epilogue. Appendices. Glossary. Answers to odd-numbered exercises. Index.

Note: Basic theory, terminology and logic are emphasized in this introductory college textbook on statistics. Precisely worded definitions are ... special feature and, throughout the book, defined terms are printed in italics so as to call the reader's attention to them. The mathematical bases, including calculus, of statistical methods are given due attention; however, many theorems are not proved. Both topics are treated very compactly in line with the author's belief that the students must acquire facility in reading compact mathematical expressions. Though not ... "simplified" text it is nevertheless well suited to the instruction of students who are preparing for careers in science and will use statistical methods in the design of experiments and the interpretation of experimental results.

BERKELEY SYMPOSIUM ON MATHEMATICAL STATISTICS AND PROBABILITY

Proceedings of the second Berkeley Symposium on Mathematical Statistics and Probability, held at the Statistical Laboratory, Department of Mathematics University of California, July 31–August 12, 1950 Edited by Jerzy Neyman Berkeley University of California Press, 1951 666 p illus 26 cm $11 00 385

Content Part I Mathematical statistics Asymptotic minimax solutions of sequential point estimation problems, by A. Wald. Some applications of the Cramér-Rao inequality by J L. Hodges, Jr and E. L. Lehmann. A generalized T test and measure of multivariate dispersion, by H. Hotelling. Tolerance intervals for linear regression by W A. Wallis. Bayes and minimax estimates for quadratic loss functions, by M A. Girshick and L. J Savage. Confidence regions for linear regressions, by P G Hoel. "Optimum nonparametric tests, by W Hoeffding. Comparison of experiments, by D Blackwell. The asymptotic distribution of certain characteristic roots and vectors, by T W Anderson. Asymptotically subminimax solutions of compound statistical decision problems, by H. Robbins. Characterization of the minimal complete class of decision functions when the number of distributions and decisions is finite, by A. Wald and J Wolfowitz. On median tests for linear hypotheses, by G. W Brown and A. M Mood. Conditional expectation and convex functions, by E. W Barankin. Part II, Probability· Wiener' random function and other Laplacian random functions, by P Lévy On some connections between probability theory and differential and integral equations, by M. Kac. Recent suggestions for the reconciliation of theories of probability by B De Finetti. Diffusion processes in genetics, by W Feller Random ergodic theorems and Markoff processes with a stable distribution, by S Kakutani. A problem on random walk, by R. S. Lehman. Continuous parameter martingales, by J L. Doob. On almost sure convergence, by M. Loève. Some mathematical models for branching processes, by T E. Harris. A contribution to the theory of stochastic processes, by H. Cramér The strong law of large numbers, by K. L. Chung. Some problems on random walk in space, by A. Dvoretzky and P Erdös. A remark on characteristic functions, by A. Zygmund. Random functions from Poisson process, by R. Fortet. Part III Astronomy An approach to the dynamics of stellar systems, by B Lindblad. The problem of stellar evolution considered statistically by O Struve. Statistical studies relating to the distribution of the elements of spectroscopic binaries, by E. L. Scott. Correction of frequency functions for observational errors of the variables, by R. J Trumpler Hydrodynamical description of stellar motions, by L. G. Henyey Part IV Biometry Improvement by means of selection, by W G. Cochran. Relative precision of minimum chi-square and maximum likelihood estimates of regression coefficients, by J Berkson. Part V Econometrics Nonlinear programming, by H. W Kuhn and A. W Tucker Why "should" statisticians and businessmen maximize "moral expectation"? by J Marschak. An extension of the basic theorems of classical welfare economics, by K. J Arrow Part VI, Physics The concept of probability in quantum mechanics, by R. P Feynman. Statistical questions in meson theory by H. W Lewis. Statistical mechanics of continuous medium (vibrating string with fixed ends, by J Kampé de Fériet. Philosophical problems of the statistical interpretations of quantum mechanics, by V F Lenzen. Correlation of position for the ideal quantum gas, by G. Placzek. Part VII, Traffic engineering Distribution of vehicle speeds and travel times, by D. S. Berry and D M. Belmont. Statistical techniques in the field of traffic engineering and traffic research, by T W Forbes. Part VIII, Wave analysis Correlograms for Pacific Ocean waves, by P Rudnick. Experimental correlogram analyses of artificial time series (with special reference to analyses of oceanographic data) by H. R. Seiwell.

—— Proceedings of the third Berkeley Symposium on Mathematical Statistics and Probability, held at the Statistical Laboratory University of California, December 1954 July and August, 1955 Edited by Jerzy Neyman Berkeley University of California Press 1956 5 v illus. 26 cm Vol I $6 00, vol II $6 50 vol III $6 25 vol. Selection of nonrepeatable observations for estimation, by G. Elfving. Some problems in estimating the spectrum of a time series, by U Grenander and M. Rosenblatt. Two approximations to the Robbins-Monro process, by J L. Hodges, Jr and E. L. Lehmann. The role of assumption in statistical decisions, by W Hoeffding. Decision theory for Pólya type distributions, case of two actions, I, by S. Karlin. On the asymptotic theory of estimation and testing hypotheses, by L. Le Cam. An empirical Bayes approach to statistics, by H. Robbins. Some regression problems in time series analysis, by M. Rosenblatt. Efficient nonparametric testing and estimation, by C. Stein. Inadmissibility of the usual estimator for the mean of a multi-variate normal distribution, by C. Stein. The computation of the X-distribution, by B. L. van der Waerden. Volume II, Contributions to probability theory On a class of probability spaces, by D. Blackwell. Stationarity boundedness, almost periodicity of random-valued functions, by S. Bochner Foundations of the theory of continuous parameter Markov chains, by K. L. Chung. Probabilities, observations and predictions, by A. H. Copeland, Sr. Probability methods applied to the first boundary value problem, by J L. Doob. Random distributions with an application to telephone engineering, by R. M. Fortet. The zeros of random polynomial, by J M. Hammersley The existence of stationary measures for certain Markov processes, by T E. Harris. Isotropic random current, by K. Itô. A special problem of Brownian motion and general theory of Gaussian random functions, by P Lévy Ranking limit problem, by M. Loève. Characterization of populations by properties of suitable statistics, by E. Lukacs. Random variables from the point of view of general theory of variables, by K. Menger L-random elements and L-random elements in Banach spaces, by E. Mourier A note on random trigonometric polynomials, by R. Salem and A. Zygmund. Volume III, Contributions to astronomy and physics. I, Contributions to astronomy (I) Hertzsprung-Russell diagram The relationship between the color and the luminosity of stars near the sun, by O J. Eggen The spectra and other properties of stars lying below the normal main sequence, by J L. Greenstein. Photoelectric studies of stellar magnitudes and colors, by H. L. Johnson. Evidence for sequences in the color-luminosity for M-dwarfs, by G. E. Kron. The Hertzsprung Russell diagram, by B. Strömgren. (II) Spatial distribution of galaxies. Galaxies, statistics and relativity by G C. McVittie Statistics of images of galaxies with particular reference to clustering, by J Neyman and others. Statistics of clusters of galaxies distribution of centers, angular dimensions, structure, luminosity function of member galaxies, by F Zwicky II, Contributions to physics Statistical mechanics and probability theory by A. Blanc-Lapierre and A. Tortrat. Foundations of kinetic theory by M. Kac. Random solutions of partial differential equations, by J Kampé de Fériet. Theory of the vibration of simple cubic lattices with nearest neighbor interactions, by E. Montroll. Nonlinear prediction and dynamics, by N Wiener Volume IV Contributions to biology and problems of health. I, Contributions to biology Some genetic problems in natural populations, by J Crow and M. Kimura. Some genetic problems in controlled populations, by E. R Dempster Struggle for existence the Tribolium model, biological and statistical aspects. II, Contributions to problems of health Deterministic and stochastic models for recurrent epidemics, by M. S. Bartlett. On the stochastic theory of epidemics, by A. T Bharucha-Reid. Statistical studies in medical diagnoses, by C. L. Chiang and others. A statistical problem arising from retrospective studies, by J Cornfield. Deterministic and stochastic epidemics in closed populations, by D G. Kendall. Problems in contagion, by W F Taylor Volume V Contributions to econometrics, industrial research, and psychometry I, Contributions to econometrics Reduction of constrained maxima to saddle-point problems, by K. J Arrow and L. Hurwicz. Toward an objectivistic theory of probability by E. W Barankin. Problems of value measurement for theory of induction and decisions, by C. W Churchman. The role of subjective probability and utility in decision-making, by P Suppes. II, Contributions to industrial research Continuous sampling plans, by A. H. Bowker Fractional replication in industrial research, by C. Daniel Sequential procedures for selecting the best exponential population, by M. Sobel. III, Contributions to psychometry· Statistical inference in factor analysis, by T W Anderson and H. Rubin. Stochastic learning models, by F Mosteller Probability and statistics in psychometric research—item analysis and classification techniques, by H. Solomon.

Note Papers which were presented at the second and third Berkeley Symposia on Mathematical Statistics and Probability have been collected in these volumes. In most instances they are accompanied by literature references, but there are no transcripts or excerpts of discussions. Many of the papers represent the first publication of recent advances in statistical methods and probability

theory. The proceedings of the first symposium in the series, held in 1945-1946, and published in 1949 and of the second symposium held in 1950 and published in 1951, are now out of print.

CROXTON FREDERICK E. AND DUDLEY J COWDEN

Applied general statistics. Second edition. New York Prentice-Hall, Inc., 1955 843 p illus. 23 cm. $7.00 386

Contents (abridged) Introduction. Statistical data. Statistical tables. Graphic presentation—I. Curves using arithmetic scales—II. The semi-logarithmic or ratio chart—III. Other types of charts. Rates, ratios, and percentages. The frequency distribution. Measures of central tendency. Dispersion, skewness, and kurtosis. The problem of time series. Analysis of time series—Secular trend I. The straight line—Secular trend II. Non-linear trends—Periodic movements I. Constant seasonal patterns—Periodic movements II. Changing seasonal patterns—Cyclical movements, adjusting time series for trend, seasonal, and irregular movements. Fundamentals in index number construction. Index number theory and practice. Correlation—I. Two-variable linear correlation—II. Two-variable non-linear correlation—III. Multiple and partial correlation—IV. Correlation of time series. Describing a frequency distribution by a fitted curve. Statistical significance—I. Arithmetic means—II. Proportions and the chi-square test—III. Variances, analysis of variance, measures of skewness and kurtosis, and correlation coefficients. Appendices: Tables. Calendar of working days. Sums of the first six powers of the first 50 natural numbers. Sums of the first six powers of the first 50 odd natural numbers. Ordinates of the normal curve. Values of t. Values of χ^2. Squares, square roots, and reciprocals, 1–1,000. Rounding numbers. Selected list of readily available sources of data. Index.

Note A broad, comparatively elementary exposition of commonly used statistical methods. It is intended for the instruction of college students and persons outside of colleges who have need of an understanding of general statistical methods and their applications. As textbook it is designed for both short and full-length courses, with the chapters which may be omitted without destroying the continuity of treatment being distinctively marked. The material used as illustrations of applications has been drawn from the fields of economics, sociology and business. Some attention is given to exposing typical examples of misuse of statistics and faulty interpretation of statistical data. The book is complementary but quite independent of the authors' *Practical business statistics*. The first edition was published in 1939. In the second edition, the book has been considerably shortened and extensively rewritten.

DOOB J L.

Stochastic processes. New York John Wiley & Sons, 1953 654 p illus 24 cm. (Wiley publications in statistics Walter A. Shewhart, editor) $12 75 387

Contents Introduction and probability background. Definition of stochastic process—principal classes. Processes with mutually independent random variables. Processes with mutually uncorrelated or orthogonal random variables. Markov processes—discrete parameter—continuous parameter. Martingales. Processes with independent increments. Processes with orthogonal increments. Stationary processes—discrete parameter—continuous parameter. Linear least squares prediction—stationary (wide sense) processes. Supplement. Appendix. Bibliography. Index.

Note An advanced mathematical treatment of random or chance variables. About the phrase "stochastic processes," the author says, "Historically the term stochastic process has been reserved for families (usually infinite) of random variables with some simple relationship between the variables, and this book is devoted to the most important examples of such families." A good background in mathematical probability theory is required, and the author outlines this background in his first chapter, stating elementary definitions and theorems in detail. The mathematical basis for each stochastic process discussed is developed quite logically, and theorems are clearly stated and carefully proved. Entire chapters are given over to aspects of the subject which are treated in just a few paragraphs in other books on probability. Besides the coverage indicated by chapter headings, these topics (among many others) are discussed in some detail: Borel field, Brownian movements, Chapman-Kolmogorov equation, Fourier transforms, Gaussian process, large numbers law, Lebesgue-Stieltjes measure, Poisson process, and several types of transformations. Literature references and historical remarks are in the appendix. The bibliography is selective. The author is Professor of Mathematics in the University of Illinois.

HOEL PAUL G

Introduction to mathematical statistics. Second edition New York John Wiley & Sons, Inc. 1954 331 p illus. 23 cm. (Wiley publications in statistics Walter A. Shewhart, editor) $5.00 388

Contents Introduction. Probability. Nature of statistical methods. Empirical frequency distributions of one variable. Theoretical frequency distributions of one variable. Elementary sampling theory for one variable. Correlation and regression. Theoretical frequency distributions for correlation and regression. Testing goodness of fit. General principles for testing hypotheses and for estimation. Small sample distributions. Statistical design in experiments. Nonparametric methods. Tables. Index.

Note A college text designed as an introduction to standard concepts, basic theory and standard applications. The level of treatment presupposes a knowledge of elementary calculus. The formulas requiring advanced calculus for their derivation are used in the exposition but proofs are not given. However references to books in which the proofs may be found are given. Classical large-sample methods are the main topic of the chapters in the first half of the book, and readers who complete only these chapters will receive an introduction to classical concepts and methods. In general, the remaining chapters are devoted to small-sample methods; however other topics are introduced, as the chapter titles indicate. The first edition was published in 1947. Important and fairly extensive changes have been made in this second edition. They include the addition of a chapter on probability, one on the nature of statistical method, and one on nonparametric methods. Other chapters have been revised, so as to place somewhat more emphasis on theory; however the mathematical level of the book was not changed.

KENNEY, J F., AND E S KEEPING

Mathematics of statistics, Part one. Third edition. Princeton D Van Nostrand Company Inc. 1954 348 p. illus. 23 cm. $5.25 389

Contents Frequency distributions. Graphical representation. The median and other quantiles. The arithmetic mean and other averages. Index numbers. Standard deviation and other measures of dispersion. Moments; skewness and kurtosis. The normal curve. Probability. The binomial and Poisson distributions. Significance tests for binomial populations. Significance of means and variances. Nonparametric and order statistics. Time series. Linear regression and correlation. Further topics in correlation. Review questions and problems. Appendix. Additional answers. Index.

Note An introductory textbook designed for use in undergraduate courses offered to students who have not had college courses in mathematics. The first eight chapters are devoted to descriptive statistics. The chapters that follow deal with the somewhat more advanced concepts and techniques that are named in their titles. Some of the derivations in these later chapters assume a knowledge of elementary calculus on the part of the student, but the book is so arranged that these parts may be skipped if necessary. Any other advanced mathematical technics needed, for example, the elementary algebra of permutations and combinations, are taught in the book. Numerous worked examples are included as part of the exposition. The first edition was published in 1939 and the second edition in 1946. This third edition represents an extensive revision and augmentation, and the level of exposition has been raised somewhat. The chapter on index numbers has been added.

KENNEY J F., AND E S KEEPING

Mathematics of statistics, Part two. Second edition. Princeton D Van Nostrand Company Inc. 1951 429 p. illus. 23 cm. $5.50. 390

Contents Probability. The binomial distribution and the normal and Poisson approximations. Some useful integrals and functions. Distributions of two or more variables; moment-generating functions, the law of large numbers. The gamma, beta, and chi-square distributions; the Pearson and Gram-Charlier systems of curves; curve fitting. Fundamentals of sampling theory with special reference to the mean. Small or exact sampling theory. Linear regression, simple correlation, and contingency. Analysis of variance and covariance. Matrix algebra and the method of least squares. Curvilinear regression, multiple and partial correlation. Further considerations on statistical inference. Appendix tables. Index.

Note. Although complementary to the author's *Mathematics of statistics, Part one,* in the sense that students are assumed to have had an introduction to the mathematics of statistics equivalent to that provided by Part one, the two books are independent of one another. Part two, also, is designed for undergraduate use, but both the presupposed mathematical preparation and the mathematical level of the text itself are higher. A knowledge of advanced calculus is assumed. Statistical techniques useful in the interpretation of data derived from scientific experiments and observations are emphasized. As in Part one, worked examples are employed in the exposition. The first edition was published in 1939 and was pioneer text in the teaching of mathematical statistics at the undergraduate level. Although it has the same purpose, this second edition represents a very extensive revision and enlargement of the original work.

MANN, HENRY B

Introduction to the theory of stochastic processes *depending on a continuous* parameter Washington, D C Government Printing Office, 1953 45 p 26 cm. (United States. National Bureau of Standards. Applied *mathematics series No 24)* $0.35 391

Contents: Introduction. Fundamental concepts Random variables. Convergence. Stochastic processes. Convergence in the mean. Differentiation. Stochastic processes of second order Integration. Special processes The fundamental random process. Further properties of the F.R.P frictional effects. The Ornstein-Uhlenbeck process. Estimation of parameters Estimation of the parameter of the F.R.P F.R.P with mean value function. Estimation of parameters for the O U.P The general differential process. Differential processes modified by mechanical devices Filter effect. *Counter data. The Fourier analysis of stochastic processes* General theory Trigonometric expansion of the F.R.P Stationary processes. The mean ergodic theorem. Index.

Note To quote from the author's introduction the mathematical theory f stochastic processes has progressed rapidly during the last two decades. This rapid progress has resulted in a large diversification of notation and terminology which makes it difficult even *for a mathematician to inform himself* on the *subject.* It seemed, therefore, advisable to bring together under a unified terminology and notation some of the basic definitions and results of this theory The viewpoint taken was that of the mathematical statistician. It was one f the goals of the present monograph to develop the theory of stochastic processes from this viewpoint with as little appeal to abstract measure theory as possible.

MOOD, ALEXANDER MCFARLANE

Introduction to the theory of statistics New York McGraw Hill Book Company Inc., 1950 433 p illus *24 cm* $6.50 392

Contents Introduction. Probability and combinatorial methods. Discrete distributions. Distributions for continuous variates. Expected values and moments. Special continuous distributions. Sampling. Point estimation. The multivariate normal distribution. Sampling distributions. Interval estimation. Tests of hypotheses. Regression and linear hypotheses. Experimental designs and the *analysis of variance* Sequential tests *of hypotheses.* Distribution-free methods. Tables. Index.

Note Although theory rather than applications is covered in this college text, the book is addressed to student scientists who will be more concerned with applications. The review problems illustrate applications in several fields f science. A knowledge of elementary calculus is presumed, and the treatment is not mathematically rigorous. Discussions of essential points are full rather than concise and the author's style reads easily hence the book is suitable one for the graduate scientist in need f an introduction to be studied without an instructor The author is on the *staff* of the Rand Corporation.

SAVAGE, LEONARD J

The foundations of statistics New York John Wiley & Sons 1954 294 p illus. 24 cm. (Wiley publications in statistics W A Shewhart, editor) $6 95 393

Contents Introduction. Preliminary considerations on decision in the face of uncertainty Personal probability Critical comments on personal probability Utility Observation. Partition problems. Statistics proper Introduction to the minimax theory A personalistic reinterpretation of the minimax theory The parallelism between the minimax theory and the theory of two-person games. The mathematics of minimax problems. Objections to the minimax rules. The minimax theory applied to observations. Point estimation. Testing. Interval estimation and *related topics. Appendix. Technical* symbols. Author index. Subject index.

Note. It is perhaps unfortunate that many people who believe that the laws of probability are definite and immutable will not be able to understand this book. The indefinite and tentative current state of probability theory is indicated by the necessity f classifying the "views" regarding them into three classes which the author calls "objectivistic, "personalistic, and "necessary Of his *own* book, the author states that it presents a theory of the foundations of statistics which is based on a personalistic view of probability Numerous sections and paragraphs are written in the common language, but the greater part of the discussion is cast in the terms and symbols of mathematical logic, probability and statistical theory Essentially the book is addressed to specialists and to advanced students who are preparing to become specialists.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Statistical theory of extreme values and some practical applications A series of lectures by Emil J Gumbel Prepared for publi*cation with the assistance of* Julius Lieblein Washington D C Government Printing Office, 1954 51 p 26 cm. (National Bureau of Standards Applied mathematics series No 33) $0 40 394

Contents Lecture I: Survey of practical applications of extreme-value theory Lecture II, Exceedances, return periods, and probability papers. Lecture III, Exact and asymptotic distributions of extremes. *Lecture IV* Applications. Conclusion. *Summary of procedures.* Bibliography

Note In this pamphlet are published four lectures on extreme value statistical theory The lectures were originally delivered before the National Bureau of Standards, and their publication was sponsored jointly by the Bureau and the National Advisory Committee for Aeronautics. The lectures are of interest to persons concerned *in any way with statistical* theory their aim being to make the statistical theory and techniques of extreme values readily available to scientists and engineers. The author summarizes the content of the lectures as follows "The first lecture outlines some of the practical problems to which the theory pertains. The second lecture introduces certain new statistical tools necessary for the theory which is developed in the third lecture, first in exact, then in asymptotic form. The fourth lecture shows a series of practical applications and gives all numerical details for enabling interested readers to apply the method to their own problems. Some understanding of basic statistical theory and the calculus of probabilities on the part of the reader is essential.

WALD, ABRAHAM

Selected papers in statistics and probability Edited for the Institute of Mathematical Statistics T W Anderson, committee chairman. New York McGraw Hill Book Company, Inc. *1955 702 p 27 cm* Now available from Stanford University Press $10 00 395

Contents (abridged) The life of Abraham Wald. Discussion of papers. The publications of Abraham Wald (bibliography reprinted from *Annals of mathematical statistics, 1952)* *Name index.* Subject index.

Note Abraham Wald's work in statistics and probability constitutes landmark in the development of mathematical statistics. During his lifetime he published only two books and one pamphlet all the rest of his writings appeared in professional journals. In this book the greater part of the journal contributions have been made available in book form. Preceding them in the volume are short biographical sketch, an 18-page discussion f the papers in the volume, and bibliography f Wald's publications reprinted from the *Annals of mathematical statistics,* issue of March, 1952 McGraw-Hill Book Company's edition, published in 1955 soon went out of print. The book was reprinted in 1957 by Stanford University Press and is available at the price noted above.

Wald Abraham

Statistical decision functions. New York John Wiley & Sons, Inc. 1950. 179 p. illus. 23 cm. (Wiley publications in statistics W. A. Shewhart, editor) $6.50. 396

Contents: The general statistical decision problem: definitions and preliminary discussion. Zero sum two-person games with infinitely many strategies. Development of a general theory of statistical decision functions. Properties of Bayes solutions when the chance variables are independently and identically distributed and the cost of experimentation is proportional to the number of observations. Application of the general theory to various special cases. Bibliography. Index.

Note: An important contribution to statistical theory. It contains the first full statement of a general theory of statistical decision functions. The work has particular application to multi-stage scientific experiments, quality control procedures, etc., where stages beyond the first are selected or modified on the basis of the results of the first experiment or sample. However it is written on the theoretical plane and is chiefly of interest to persons who are experts in statistics or who at least have a fair knowledge of basic statistical theory and techniques.

Wilks Samuel Stanley

Elementary statistical analysis. Princeton Princeton University Press 1948. 284 p. illus. 26 cm. $3.50 397

Contents: Introduction. Frequency distributions. Sample means and standard deviation. Elementary probability. Probability distributions. The binomial distribution. The Poisson distribution. The normal distribution. Elements of sampling. Confidence limits of population parameters. Statistical significance tests. Testing randomness in samples. Analysis of pairs of measurements. Index.

Note: A textbook that has been written for use in short introductory courses in the application of statistics. The treatment assumes that the student will have taken a course in elementary mathematical analysis. The first three chapters deal with terminology and with the description of samples. The remainder of the book is devoted to probability theory and to specific statistical techniques of wide application, especially in scientific work.

Wilks Samuel Stanley

Mathematical statistics. Princeton Princeton University Press, 1943 284 p. illus. 27 cm. $3.75 398

Contents: Introduction. Distribution functions. Some special distributions. Sampling theory. Sampling from a normal population. On the theory of statistical estimation. Tests of statistical hypotheses. Normal regression theory. Applications of normal regression theory to analysis of variance problems. On combinatorial statistical theory. An introduction to multivariate statistical analysis. Exercises for supplementary reading. Index.

Note: A treatment of the mathematical theory of statistics with special emphasis on modern developments in the field. The material has been used for several years in a two-semester advanced undergraduate course at Princeton University.

APPLIED STATISTICS AND GAME THEORY

American Society for Testing Materials

Symposium on bulk sampling. Presented at the fifty fourth annual meeting American Society for Testing Materials, Atlantic City N. J. June [redacted] 1951 Philadelphia American Society for Testing Materials, 1952 65 p illus. 23 cm. (Special technical publication no. 114) $1.75 399

Contents: Introduction, by W. E. Deming. Materials handling for bulk sampling, by J. Manuele. Economic accumulation of sampling data in connection with bulk sampling, by L. Tanner and M. Lerner. Two-stage acceptance sampling by attributes, by C. W. Dunnett and J. W. Hopkins. Coal sampling problems, by A. A. Orning. The analysis of variance in a sampling experiment, by W. M. Bertholf. The design of coal sampling procedures, by W. M. Bertholf.

Note: A collection of original papers dealing with the methods of determining the average quality of products handled in bulk. The practical problems connected with the selection of a true sample are discussed, but emphasis is placed on theory and on statistical methods. The discussions following each paper are a vital part of the symposium.

Anderson Richard Loree and T. A. Bancroft

Statistical theory in research. New York McGraw Hill Book Company Inc. 1952 399 p. illus. 24 cm. $7.00 400

Contents (abridged): Part I, Basic statistical theory: Probability. Univariate parent population distributions. Properties of univariate distribution functions. Bivariate and multivariate distributions and their properties. Derived sampling distributions and orthogonal linear functions. Derived sampling distributions—normal parent population. Introduction to point estimation and criteria of "goodness." Interval estimation. Tests of hypotheses. Special uses of chi-square. Part II, Analysis of experimental models by least squares. Regression analysis. General regression model with fixed variates. Computational methods and methods of analysis for a general regression model. Curvilinear regression—orthogonal polynomials. Least squares for experimental design models. The analysis of designs in complete block. The analysis of incomplete-blocks designs. Factorial experiments. The analysis of covariance. Analysis of data with both random and fixed effects (mixed model). The recovery of interblock information in incomplete-blocks designs. Summary of needed research. Appendix. Index.

Note: A book that is useful both as a text for college students and as a reference guide for scientists and other professional workers who make practical use of statistical theory and techniques, particularly in the design of experiments and the analysis of experimental results. The topics named in the chapter titles are treated in a clear, direct style and the authors have made frequent use of worked examples in their exposition of important points. The primary emphasis is on the basic theory but the treatment of this is definitely addressed to nonspecialists in statistics, and frequent mentions are made of applications. Selected literature references are included in the chapters.

Blackwell, David and M. A. Girshick

Theory of games and statistical decisions. New York John Wiley & Sons Inc., 1954 355 p. illus 24 cm. (Wiley publications in statistics Walter A. Shewhart editor) $7.75 401

Contents: Games in normal form. Values and optimal strategies in games. General structure of statistical games. Utility and principles of choice. Classes of optimal strategies. Fixed sample-size games with finite Ω. Fixed sample-size games with finite A. Sufficient statistics and the invariance principle in statistical games. Sequential games. Bayes and minimax sequential procedures when both Ω and A are finite. Estimation. Comparison of experiments. References. Index.

Note: In this graduate-level text, portions of the theory of games which are important to the theory of statistical decisions are explained and developed so as to constitute an introduction to statistical decision theory. The reader is assumed to be familiar with the basic concepts of statistics and of mathematical analysis. Proofs are supplied for all theorems. The bibliography runs to 150 citations.

Bross Irwin D. J.

Design for decision. New York The Macmillan Company 1953 276 p. illus. 21 cm. $4.25 402

Contents: History of decision. Nature of decision. Prediction. Probability. Values. Rules for action. Operating decision-maker. Sequential decision. Data. Models. Sampling. Measurement. Statistical inference. Statistical techniques. Design for decision. Further reading. Index.

Note: This book is an attempt to explain to non-specialists the nature, concepts and some of the uses of statistical decision. Using only a little mathematics and taking care to make this little as

clear as possible, the author has dissected the basic problems in making decisions, described the statistical tools and the raw material required. Speaking to such readers as scientists who are not mathematicians and businessmen, he shows how the ideas of statistical decision may point the way to making the best decisions in specific circumstances. The style is informal, almost breezy but the book's contents are based on sound knowledge of statistical methods on the part of the author

BURINGTON, RICHARD STEVENS, AND DONALD CURTIS MAY, JR

Handbook of probability and statistics with tables Sandusky Handbook Publishers Inc., 1953 332 p illus. 20 cm $4 50 403

Contents Introduction. Certain definitions used in statistics. Frequency distributions in one dimension. Combinations and permutations. Elementary probability theory Probability distributions in one dimension. Generating od characteristic functions. Binomial distribution. Poisson distribution Normal distribution. Probability distributions in two or more dimensions. Analysis of pairs of measurements, regression theory time series. Sampling distributions. Statistical inference. Significance tests and confidence intervals. Analysis of variance. Finite differences. Interpolation. Sequential analysis, sampling inspection, quality control. Short table of integrals. Some mathematical relationships. Tables. References. Index of names. Index of symbols. Index of Greek symbols. Index of subjects.

Note A reference handbook of probability and statistics. It contains theory working rules, and tabular material divided into two main parts: (1) summary of the more important formulas and definitions of elementary statistics and probability theory and (2) tables of distributions and other quantities of frequent use in statistical work. It is useful to students and workers in many fields statistics, probability engineering, physics, chemistry the various natural and social sciences, operations research and analysis, education business, and others.

BUROS, OSCAR KRISEN, editor

Research and statistical methodology books and reviews of 1933–1938 Arlington, Va. The Gryphon Press 1938 100 p 23 cm $1 50 404

Note An annotated bibliography of books and monographs published between January 1 1933 and November 15 1938. For each book full bibliographic information is given including both American and English prices and publishers. The most critical portions of the reviews which appeared in journals have been excerpted and printed after each entry giving each reviewer's name and title of publication. There is classified index and an index of titles.

—— The second yearbook of research and statistical methodology books and reviews Arlington, Va. The Gryphon Press, 1941 383 p 27 cm $5 00 405

Note. The excerpts presented in this volume are longer and more informative than those given in *Research and statistical methodology books and reviews of 1933–1938* described above. About one-third of the present vol me is devoted to new reviews of books listed in the earlier work. This second yearbook offers total of 1,652 review excerpts from 283 journals covering 346 books and monographs published between 1933 and 1941 Books on statistical methods, scientific method, social relations of science, collective biographies of scientists, and books on research methodology in specific fields make up the bulk of the compilation. Classes of books poorly represented in the first volume, such as mathematical economics, population studies, and general histories of science, are better represented in this volume Books on microscopy and the philosophy of science have been excluded.

—— Statistical methodology reviews 1941–1950 New York John Wiley & Sons Inc 1951 457 p 27 cm. $7 00 406

Note This third volume in the series is both guide to books on statistical method and application and digest of reviews of them. Entries are arranged alphabetically by names of authors of the books. Following each entry is an excerpt from one or more critical reviews published in professional journals. Many of the excerpts are some hundreds of words long. The work is useful aid t librarians, scientists, etc., in selecting books on statistical methodology It serves also to bring together books that are published in separate fields, for example, education, and medicine. The editor has addressed it also to book reviewers and editors of reviewing periodicals in the hope that it will lead to improvement of published reviews.

CATTELL, RAYMOND BERNARD

Factor analysis, an introduction and manual for the psychologist and social scientist. Under the editorship of Gardner Murphy New York Harper and Brothers, 1952 462 p illus 22 cm $6 00 407

Contents (abridged) Part I, Basic concepts in factor analysis The place of factor analysis in scientific method. Interpretation of correlations as clusters and factors. On obtaining factors from a correlation matrix. Rotation of factors for scientific meaning. Factor estimation and the specification equation. The covariation chart and the possibilities f obliqueness, order and efficacy Part II, Specific aims and working methods: The chief alternative designs in factorising matrix. Working methods for centroid extraction including communality estimation. The clustering methods of factor extraction. The elementary spatial computations in rotations. The special problems f oblique factors. General techniques and criteria f factor resolution. The basic art f rotation by graphs. Part III, General principles and problems The effects of errors. True factor resolution and the design of experiment. Structuring variables by combinations of factor analysis with controlled experiment. Strategy and tactics of economy in computing. Glossary Appendix: Essential steps in matrix multiplication by electronic digital calculators. Bibliography Index f names. Index f subjects.

Note In this book the techniques of factor analysis, statistical method of wide potential applications in psychology and the social sciences, are explained for the benefit of advanced college students and graduate research workers. As indicated in the title, the treatment is introductory but adequate material is included to make the book useful as practical guide for scientists interested in the use of factor analysis. References from statements in the text to citations of source articles in the bibliography are carefully given.

CHURCH, DONALD E

Speed methods of statistics, for use in business New York The Ronald Press Company 1940 97 p illus 22 cm $3 50 408

Contents Introduction. Interpretation of charts. Ratios. Scale adjustments. Trends. Seasonals. Cycles. Simple relationships. Multiple relationships. General comments regarding computation.

Note Simple methods are presented which reduce time and cost of analysis of statistical data, and avoid the mathematical difficulties usually involved in customary methods. For readers who are not trained statisticians, terms and statistical measures are explained. The fundamental theory follows orthodox statistical assumptions, particularly in graphic correlation and seasonal calculations. Use is made of simple, easily-made sliding device in conjunction with an illuminated glass by which the computations are made visually without resort to intermediate tables or calculations.

CLARK, CHARLES E

An introduction to statistics New York John Wiley & Sons Inc. 1953 266 p illus. 24 cm (Wiley publications in statistics Walter A Shewart editor) $5 25 409

Contents Introduction. Permutations and combinations. Probability Frequency and probability distributions. The reliability of sample means and probabilities. The significance of the difference between two sample means or percentages The analysis of variance. Inferences from chi square. Correlation. Answers and solutions for odd-numbered exercises. Tables. Index.

Note A textbook addressed to students without education in advanced mathematics and whose interest in statistics is due to the widespread use of statistical techniques in education, biology and other fields of science. Its chief purpose is to teach the principles and basic concepts of statistical inference but other topics, such as correlation of empirical data, also are explained There is considerable emphasis on sampling techniques and theory The organization and style of the book are such that it can be used in self-instruction as well as in organized courses. The author is Associate Professor of Mathematics at Emory University

COCHRAN WILLIAM GEMMEL, AND GERTRUDE M COX

Experimental designs. New York John Wiley & Sons, Inc., 1950 454 p. 24 cm. (Wiley mathematical series W A. Shewhart editor) 410

Contents: Introduction. Methods for increasing the accuracy of experiments. Notes on the statistical analysis of the results. Completely randomized, randomized block, and latin square designs. Factorial experiments. Confounding. Factorial experiments with main effects confounded split-plot designs. Factorial experiments confounded in quasi-latin squares. Balanced and partially balanced incomplete block designs. Lattice and cubic lattice designs. Balanced incomplete blocks. Lattice squares. Incomplete latin squares (Youden squares). Analysis of the results of series of experiments. Random permutations of 9 and 16 numbers. Selected bibliography. List of author references. Index.

Note. Interpretation of the mass of data obtained in series of experiments in problem (sometimes rather complex one) in statistics. In most cases more valid conclusions can be drawn from observed data if the experiment is planned so as to satisfy the demands of sound statistical theory. This book presents detailed plans for some hundreds of experiments designed for variety of conditions. The pertinent statistical theory is outlined, but the authors have assumed that their readers will have some familiarity with the basic principles of the analysis of variance. The book is of interest to research workers in many fields of science. A second edition was published in 1957 $10.25

COCHRAN WILLIAM GEMMEL

Sampling techniques. New York John Wiley & Sons, Inc., 1953 330 p. illus 24 cm. $7.00. 411

Contents: Introduction. Simple random sampling. Sampling for proportions and percentages. The estimation of sample size. Stratified random sampling. Ratio estimates. Regression estimates. Systematic sampling. Type of sampling unit. Subsampling with units of equal size. Subsampling with units of unequal size. Double sampling. Sources of error in surveys. Answers to exercises. Author index. Subject index.

Note. A thorough review of sampling theory with some discussion of current practice. A knowledge of calculus plus rather more than introductory statistics is assumed. Each chapter includes illustrations of possible applications of the theory presented, development of formulas used, selection of exercises for students, and useful references to collateral reading. Analysis of variance, bias, ratio estimates, regression estimates, standard error and stratified random sampling are treated in some detail. The author is Professor of Biostatistics at the Johns Hopkins University.

COLUMBIA UNIVERSITY STATISTICAL RESEARCH GROUP

Selected techniques of statistical analysis for scientific and industrial research and production and management engineering: by the Statistical Research Group, Columbia University Applied Mathematics Panel, Office of Scientific Research and Development. Edited by Churchill Eisenhart, Millard W Hastay and W Allen Wallis. New York McGraw Hill Book Company Inc., 1947 4 3 p. illus. 23 cm. $6.00. 412

Contents: Part Industrial statistics. Use of variables in acceptance inspection for percent defective, by W Allen Wallis. Tolerance limits for normal distributions, by Albert H. Bowker. Multivariate quality control, illustrated by the air testing of sample bombsights, by Harold Hotelling. Effects of rounding or grouping data, by Churchill Eisenhart. Acceptance inspection when lot quality is measured by the range, by the editors. Variability of amount of inspection for double, multiple, and sequential sampling, by the editors. Part II, Planning experiments. Planning and analyzing experiments for comparing two percentages, by Edward Paulson and W Allen Wallis. Planning and interpreting experiments for comparing two standard deviations, by Churchill Eisenhart. Utilization of limited experimental facilities when the cost of each measurement depends on its magnitude, by Milton Friedman. Experiments in which the independent variable is known only in terms of probability distribution, by the editors. Planning an experiment for estimating the mean and standard deviation of normal distribution from the observations on the cumulative distribution, by Milton Friedman. Abandoning an experiment prior to completion, by the editors. Planning experiments seeking maxima, by Milton Friedman. Part III, Techniques and tables. Probability that sample means are in opposite order to population means, by Churchill Eisenhart. Significance of the largest of set of sample estimates of variance, by Churchill Eisenhart. Inverse sine transformation of proportions, by Churchill Eisenhart. Elements of sequential analysis, by W Allen Wallis. Index.

Note. Written and edited by top-rank authorities, this work is designed for industrialists, engineers, and scientists who need statistical methods but have no time for thorough study of the theory. Although intended for nonspecialists, the book is far from popularization. In fact, working knowledge of calculus and differential equations is demanded and the authors have assumed that their readers will be accustomed to using technical publications. The 11-page index greatly enhances the work reference value.

COLUMBIA UNIVERSITY STATISTICAL RESEARCH GROUP

Sequential analysis of statistical data Applications. Prepared by the Statistical Research Group Columbia University for the Applied Mathematics Panel, National Defense Research Committee Office of Scientific Research and Development. New York Columbia University Press 1945 7 nos. in 1 v illus. 29 cm. $7 75 413

Contents: Sequential analysis in inspection and experimentation (introduction). Sequential analysis when the result of single observation is classification as good or bad and when the result of the test is acceptance or rejection (*binomial distribution*). Sequential analysis when the result of single observation is classification as good or bad and when the result of the test is decision between two methods or products (*double dichotomy*). Sequential analysis when the quality being tested is measured and when the question is whether standard is exceeded (or falls short of) (*mean of normal distribution, known standard deviation, one-sided alternative*). Sequential analysis when the quality being tested is measured and when the question is whether lot differs from standard (*mean of normal distribution, known standard deviation, two-sided alternative*). Sequential analysis of variability of quality about the average (*standard deviation of normal distribution, one-sided alternative*). Sequential analysis when quality is measured by the number of defects per unit and when the question is whether standard is exceeded (Poisson distribution). Appendices: Some properties and principles of sequential analysis.

Note. Sequential analysis proved to be so important in acceptance inspection of products manufactured for war that information about it was classified as Restricted until May 1945. The great value of the method in inspection as compared to standard sampling procedure is that the number of samples that must be tested (and destroyed in many cases) can be considerably reduced without adversely affecting the reliability of the test results. Sequential analysis is equally applicable to the interpretation of experimental data. These seven pamphlets trace the development of sequential analysis, explain the basic theory and show its application to several types of situations that occur in acceptance inspection and in experimentation. The pamphlets are bound in loose-leaf binder.

DEMING WILLIAM EDWARDS

Some theory of sampling New York John Wiley & Sons Inc., 1950 602 p. illus. 23 cm. $10.00. 414

Contents (abridged): Part The specification of the reliability required. The various errors of survey. Part II, Some elementary theory for design. Moments and expected values. Multistage sampling, with-recursion, and choice of sampling unit. Allocation in stratified sampling. Distinction between enumerative and analytic studies. Control of the risks in acceptance sampling. Part III, Some theory for analysis and estimation of precision. The sample as basis for action. Part IV Applications of some of the foregoing theory. Inventories by sampling. A population sample for Greece. Part Some further theory for design and analysis. Detailed study of some binomial and related distributions. The gamma and beta functions. Tests for hypotheses in normal theory. The distribution of the

clear as possible the author has directed the basic problems in making decisions, described the statistical tools and the raw material required. Speaking to such readers as scientists who are not mathematicians and businessmen he shows how the ideas of statistical decision may point the way to making the best decisions in specific circumstances. The style is informal, almost breezy but the book's contents are based on sound knowledge of statistical methods on the part of the author

BURINGTON, RICHARD STEVENS, AND DONALD CURTIS MAY, JR

Handbook of probability and statistics with tables Sandusky Handbook Publishers, Inc, 1953 332 p illus 20 cm $4 50 403

Contents. Introduction Certain definitions used in statistics. Frequency distributions in one dimension Combinations and permutations. Elementary probability theory Probability distributions in one dimension. Generating and characteristic functions. Binomial distribution. Poisson distribution. Normal distribution. Probability distributions in two or more dimensions. Analysis of pairs of measurements, regression theory time series. Sampling distributions. Statistical inference. Significance tests and confidence intervals. Analysis of variance. Finite differences. Interpolation. Sequential analysis, sampling inspection quality control. Short table of integrals. Some mathematical relationships. Tables. References. Index of names. Index of symbols. Index of Greek symbols. Index of subjects.

Not A reference handbook of probability and statistics. It contains theory working rules, and tabular material divided into two main parts (1) a summary of the more important formulas and definitions of elementary statistics and probability theory and (2) tables of distributions and other quantities of frequent use in statistical work. It is useful to students and workers in many fields statistics, probability engineering, physics, chemistry the various natural and social sciences, operations research and analysis, education, business, and others.

BUROS, OSCAR KRISEN, editor

Research and statistical methodology books and reviews of 1933–1938 Arlington, Va. The Gryphon Press 1938 100 p 23 cm $1 50 404

Note An annotated bibliography of books and monographs published between January 1 1933 and November 15, 1938. For each book full bibliographic information is given including both American and English prices and publishers. The most critical portions of the reviews which appeared in journals have been excerpted and printed after each entry giving each reviewer's name and title of publication. There is classified index and an index of titles.

—— The second yearbook of research and statistical methodology books and reviews. Arlington, Va. The Gryphon Press 1941 383 p 27 cm $5 00 405

Note The excerpts presented in this volume are longer and more informative than those given in *Research and statistical methodology books and reviews of 1933–1938* described above. About one-third of the present volume is devoted to new reviews of books listed in the earlier work. This second yearbook offers total of *1,652* review excerpts from 283 journals covering 340 books and monographs published between 1933 and 1941 Books on statistical methods, scientific method, social relations of science, collective biographies of scientists, and books on research methodology in specific fields make up the bulk of the compilation. Classes of books poorly represented in the first volume, such as mathematical economics, population studies, and general histories of science, are better represented in this volume. Books on microscopy and the philosophy of science have been excluded.

—— Statistical methodology reviews 1941–1950 New York John Wiley & Sons Inc 1951 457 p 27 cm $7 00 406

Note. This third volume in the series is both guide to books on statistical method and application and digest of reviews of them. Entries are arranged alphabetically by names of authors of the books. Following each entry is an excerpt from one or more critical reviews published in professional journals. Many of the excerpts are some hundreds of words long. The work is useful aid to librarians, scientists, etc., in selecting books on statistical methodology It serves also to bring together books that are published in separate fields, for example, education, and medicine. The editor has addressed it also to book reviewers and editors of reviewing periodicals in the hope that it will lead to improvement of published reviews.

CATTELL, RAYMOND BERNARD

Factor analysis, an introduction and manual for the psychologist and social scientist. Under the editorship of Gardner Murphy New York Harper and Brothers, 1952 462 p illus 22 cm $6 00 407

Contents (abridged) Part I, Basic concepts in factor analysis: The place of factor analysis in scientific method. Interpretation of correlations as clusters and factors. On obtaining factors from a correlation matrix. Rotation of factors for scientific meaning. Factor estimation and the specification equation. The covariation chart and the possibilities f obliqueness, order and efficacy Part II, Specific aims and working methods The chief alternative designs in factorizing a matrix. Working methods for centroid extraction including communality estimation. The clustering methods of factor extraction. The elementary spatial computations in rotations. The special problems of oblique factors. General techniques and criteria of factor resolution. The basic art f rotation by graphs. Part III, General principles and problems The effects of errors. True factor resolution and the design of experiment. Structuring variables by combinations f factor analysis with controlled experiment. Strategy and tactics of economy in computing. Glossary Appendix Essential steps in matrix multiplication by electronic digital calculators. Bibliography Index f names. Index f subjects.

Note In this book the techniques of factor analysis, statistical method of wide potential applications in psychology and the social sciences, are explained for the benefit of advanced college students and graduat research workers. As indicated in the title, the treatment is introductory but adequate material is included to make the book useful as practical guide for scientists interested in the use of factor analysis. References from statements in the text t citations f source articles in the bibliography are carefully given.

CHURCH, DONALD E

Speed methods of statistics for use in business New York The Ronald Press Company, 1940 97 p illus. 22 cm $3 50 408

Contents Introduction. Interpretation of charts. Ratios. Scale adjustments. Trends. Seasonals. Cycles. Simple relationships. Multiple relationships. General comments regarding computation.

Note Simple methods are presented which reduce time and cost of analysis of statistical data, and avoid the mathematical difficulties usually involved in customary methods. For readers who are not trained statisticians, terms and statistical measures are explained. The fundamental theory follows orthodox statistical assumptions, particularly in graphic correlation and seasonal calculations. Use is made of simple, easily-made sliding device in conjunction with an illuminated glass by which the computations are made visually without resort to intermediate tables or calculations.

CLARK, CHARLES E

An introduction to statistics. New York John Wiley & Sons Inc., 1953 266 p illus. 24 cm (Wiley publications in statistics Walter A Shewart, editor) $5.25 409

Contents Introduction. Permutations and combinations. Probability Frequency and probability distributions The reliability of sample means and probabilities. The significance of the difference between two sample means or percentages. The analysis of variance Inferences from chi square. Correlation. Answers and solutions for odd-numbered exercises. Tables. Index.

Not A textbook addressed t students without education in advanced mathematics and whose interest in statistics is due to the widespread use of statistical techniques in education, biology and other fields of science. Its chief purpose is to teach the principles and basic concepts of *statistical inference* but other topics, such as correlation of empirical data, also are explained. There is considerable emphasis on sampling techniques and theory The organization and style of the book are such that it can be used in self-instruction as well as in organized courses. The author is Associate Professor of Mathematics at *Emory University*

block designs. Balanced designs. Some additional designs. Covariance. Literature cited. Index. Problems.

Note: A college textbook of unusual comprehensiveness. It is addressed to students and others who are familiar with basic concepts, technology and terminology of statistical methods and it covers experimental design in a way that should prepare readers of the book to design experiments for most conditions encountered in scientific research. The expository matter includes a considerable number of examples fully worked out by the author. This feature, together with the extensive bibliography, detailed index, and separation at the end of the book of problems for the student, make the book especially useful as a reference tool for graduate scientists, especially those in biological fields.

FREEMAN, HAROLD ADOLPH

Industrial statistics statistical technique applied to problems in industrial research and quality control. New York John Wiley & Sons, Inc. 1942 178 p illus. 23 cm. $4.00. 421

Contents (abridged): The difference of two means. Difference among several means. Relationship among variables. Systematic quality control. Sampling and the risks of producers and buyers. References. Tables. Index.

Note: A text designed originally for courses in industrial statistics given at Massachusetts Institute of Technology giving examples of the uses of elementary statistical methods in the design and analysis of experiments carried out in industrial plants and scientific laboratories. It also deals with several of the statistical features of the problem of establishing a systematic program through which the quality of industrial output can be studied and controlled. Each chapter is divided into two parts, the first presenting the problem, examples, method, and results, while the second gives a mathematical exposition of theory. There are a list of 80 references and large number of useful tables.

FRUCHTER, BENJAMIN

Introduction to factor analysis. New York D Van Nostrand Company Inc., 1954 280 p. illus. 24 cm. $5.50. 422

Contents: Introduction. Cluster analysis. Mathematics essential for factor analysis. Basic assumptions of factor analysis. Diagonal and centroid methods of factoring. Multiple-group and principal-axes methods of factoring. Methods of rotation—orthogonal axes. Methods of rotation—oblique axes. Interpretation of factors. Applications in the literature. Some general considerations. Appendix: Calculation of the estimated factor loadings of a variable not included in the original analysis. Bibliography. Answers to problems. Index.

Note: A beginning textbook in which the author introduces and develops the basic concepts of factor analysis, including the mathematics, in such a way as to give the student the basic knowledge needed to apply factorial methods to any area of science in which he may need it. An extensive bibliography (14 pages) for the period 1940 through 1952 is included. In addition to use in organized classes, the book can be used for self instruction by readers, especially graduate scientists, who have the requisite knowledge of basic mathematics and statistics.

FRYER, H. C

Elements of statistics. New York John Wiley & Sons, Inc., 1954 262 p illus. 24 cm. (Wiley publications in statistics Walter A. Shewhart, editor) $4.75 423

Contents: History and introduction. The summarization of sets of data involving one type of measurement. Elementary probability. The binomial and normal frequency distributions. Sampling from binomial populations. Introductory sampling theory for a normal population involving only one variable. Linear regression and correlation. Tables. Index.

Note: A well-written, general introduction to statistical concepts and methods. Interest has been lent to the subject not only by the common technique of described applications but also by painstaking exposition and careful explanation of such notions as the "arithmetic mean," "standard deviation," and "population." The book is addressed to beginners, especially those who are interested in applying statistics in such fields as agricultural experimentation and are taking a course on the subject in college. It is not a popularization, although it is suitable also for reading outside of college by persons who have some familiarity with mathematics, including algebra and the interpretation of graphs. The author is Professor of Mathematics in Kansas State College.

GOULDEN, CYRIL HAROLD

Methods of statistical analysis Second edition. New York John Wiley & Sons, Inc. 1952 467 p 24 cm (Wiley publications in statistics Walter A. Shewhart, editor) $7.50 424

Contents: Introductory concepts. Variation, statistics, and the frequency table. Theoretical frequency distributions. Tests of significance. The analysis of variance. Linear regression analysis. Correlation. Partial and multiple regression and correlation. The analysis of covariance. Non-linear regression. Basic experimental designs. Factorial experiments. Incomplete block experiments. The treatment of non-orthogonal data. Goodness of fit. Tests of independence. The discriminant function. Probit analysis. Quality control and sampling for inspection and verification. Appendix. Index.

Note: A text and reference book designed for research workers in the sciences. There is some emphasis on experimental design in the fields of agriculture and biology. However this emphasis is not heavy enough to lessen the value of the book for students and graduate workers in other fields such as psychology. The first edition appeared in 1939. This edition represents a very extensive revision and a considerable increase in size. Each of the chapters is supplemented by a substantial list of the pertinent literature. The author is Chief of the Cereal Division of the Central Experimental Farm in Ottawa, Canada.

GUILFORD J P

Fundamental statistics in psychology and education. Third edition. New York McGraw Hill Book Company Inc., 1956 565 p illus. 23 cm. (McGraw Hill series in psychology Clifford T Morgan consulting editor) $6.25 425

Contents: Introduction for students. Counting and measuring. Frequency distributions. Measures of central value—of variability. Cumulative distributions and norms. The normal distribution curve. Correlation. The reliability and significance of statistics. Testing hypotheses. Chi-square and other statistical tests. Introduction to analysis of variance. Special correlation methods and problems. Prediction of attributes. Prediction of measurements. Multiple prediction. Reliability of measurements. Validity of measurements. Test scales and norms. Appendices. Index.

Note: A successful introductory text for students interested in the applications of statistics in the two fields mentioned in the title. The first edition was published in 1942, and the second edition in 1950. In each edition, there has been a significant change in the book's scope, although it remains addressed to the same type of audience. In this third edition, shorter than the second edition by approximately 30 pages, some older material on descriptive statistics has been eliminated or condensed, and more emphasis has been placed on hypothesis testing and statistical inference. In the treatment of these subjects, new developments in hypothesis testing and tests of significance are included among other topics. As was true of the second edition, enough reference material is included to make the book useful as a working manual in applied statistics in addition to its use as a text.

HANSEN MORRIS H., AND OTHERS

Sample survey methods and theory By Morris H. Hansen William N Hurwitz, and William G Madow New York John Wiley & Sons Inc., 1953 2 v illus. 24 cm. (Wiley publications in statistics Walter A. Shewhart, editor) Vol. 1 $8.75 vol. 2 $7.75 426

Contents: Volume 1, Methods and applications: Introduction. An elementary survey of sampling principles. Biases and nonsampling errors in survey results. Sample designs for some common sampling problems. Simple random sampling. Stratified simple random sampling. Simple one- or two-stage cluster sampling. Stratified single- or multi-stage cluster sampling. Control of variation in size of cluster in estimating totals, averages, or ratios. Multi-stage sampling with large primary sampling units. Estimating variances. Regression estimates, double sampling, sampling for time series, systematic

external and internal variances. Appendix A page of random numbers. Index.

Note This important contribution to the application of statistical theory deals with obtaining accurate information by counting or examining only a portion of the "population" about which information is desired. This technique is often used in opinion polls, consumer surveys, census estimates, etc. It has application also in the planning of scientific experiments and interpretation of the results obtained. The work is written strictly from the viewpoint of applied statistics and is intended for professional workers and graduate students who have already mastered the elements of general statistical theory

DEMING, WILLIAM EDWARDS

Statistical adjustment of data. New York John Wiley & Sons, Inc., 1943 261 p illus 21 cm. $6 00 415

Contents (abridged): On the meaning of adjustment. Simple illustrations of curve fitting. The propagation of error The general problem in least squares. Geometric conditions. Systematic computation for geometric conditions. Adjusting sample frequencies to expected marginal totals. Curve fitting in more complicated circumstances. Systematic computations for fitting curves by least squares. Exercise on fitting various functions. Four examples in curve fitting. Appendix. Index.

Note: A text and reference book for graduate and undergraduate engineering students, which deals mainly with scattered portions of the subject that may be difficult to find elsewhere. The book is intended as supplement to larger texts on statistical adjustment of data, and several topics relating to the theory of least squares and to the theories of Hotelling, Wald, and Eisenhart have been intentionally omitted. The book presents some basic statistical concepts and those methods of arriving at figures which can be used for a given application. Skeleton table forms for calculation are provided. A knowledge of differential calculus is helpful but not a necessary prerequisite.

DIXON, WILFRID JOSEPH, AND FRANK J MASSEY, JR.

Introduction to statistical analysis New York McGraw Hill Book Company, Inc, 1951 370 p illus 23 cm 416

Contents Introduction. Distributions. Introduction to measures of central value and dispersion. Universe and sample. The normal distribution. Various measures of central value and dispersion. Statistical inference. The variance estimation and tests of hypotheses. The mean estimation and tests of hypotheses. Analysis of variance. Regression and correlation. Analysis of covariance. Enumeration statistics. Probability of accepting a false hypothesis. Macrostatistics. Microstatistics. Nonparametric statistics. Sequential analysis. Sensitivity experiments. Appendix. Index.

Note In this book, statistics is viewed as "the science of experimentation. The work is a textbook written for basic statistics course to be taken by students from all fields in which statistics find application. The order and emphasis of topics are largely based upon the recommendations for a basic course in statistics stated by the Committee on Teaching of Statistics of the National Research Council. The appendix includes tables, etc., for reference work. A second edition was published in 1957 488 p., $6.00.

DORNBUSCH, SANFORD M, AND CALVIN F SCHMID

A primer of social statistics New York McGraw Hill Book Company, Inc. 1955 251 p illus 23 cm (McGraw Hill series in sociology and anthropology Richard T LaPiere consulting editor) $4 75 417

Contents. Some advice for the student. Tabular presentation. Graphic presentation. Basic rules of summation. Measures of central value. Measures of variability Ratios, proportions, and rates. Computations with grouped data. Universe and sample. Sampling distributions. Statistical inference. The binomial distribution. The normal distribution. Sampling distribution of proportions. Sampling distribution of means. Prediction and regression. Linear correlation. Contingency A taste of things to come. And few grains of salt. Appendix. Index.

Note An introduction to statistics for students with little preparation in mathematics. Mathematics beyond arithmetic is explained in the book. The presentation is slanted toward the interests of students of the social sciences only by the inclusion of examples from sociology Basic notions such as confidence limits and random sampling are fully discussed though in an elementary manner A considerabl number of statistical diagrams and charts are included and explained. The book's simplicity makes it a good one for readers outside of colleges who wish a simple book for self-instruction.

EDWARDS, ALLEN LOUIS

Experimental design in psychological research. New York Rinehart & Company Inc., 1950 446 p illus 22 cm $5.50 418

Contents. The nature of psychological research. Principles of experimental design. Probability and experimental design. The normal and X^2 approximations of the binomial probabilities. Experiments involving comparison of the difference between 2 frequencies or proportions. The application of the X^2 distribution to research problems involving more than 1 degree of freedom. Testing hypotheses about correlation coefficients. The t test and the significance of means and differences between means. Heterogeneity of variance and the t test. An introduction to the analysis of variance. Heterogeneity of variance and transformations of the scale. The 2^n factorial design for experiments in which variables are varied in only 2 ways. Complex factorial designs. Experimental designs involving matched groups. Experimental designs involving repeated measurements of the same subjects. The Latin square design in psychological research. Applications of the analysis of covariance. Bibliography List of formulas. Appendix. Index of names. Index of subjects.

Note. This book is concerned with the planning of experiments and with the analysis of experimental data, primarily in the fields of psychology sociology and education. It presents for students in these fields standard techniques and some of the newer developments in statistical analysis, particularly with respect to small-sample theory The reader or student needs a working knowledge of algebra and an elementary knowledge of applied statistics in order to understand this work.

EDWARDS, ALLEN LOUIS

Statistical methods for the behavioral sciences. New York Rinehart & Company, Inc. 1954 542 p illus 23 cm $6 50 419

Contents Introduction. Survey of rules and principles. Measures of central tendency and variability Simplifying statistical computations. Graphical representation of frequency distributions. Standard scores and normalizing distributions. Linear regression. The product moment correlation coefficient. Random errors of measurement. Point coefficients and other measures of association. Probability and the binomial distribution. The normal distribution. The t test for the means of independent samples. The difference between the means for paired observations and equated groups. The significance of correlation and regression coefficients. The analysis of variance. Further applications of the analysis of variance. The χ^2 test of significance. Significance tests for ranked data. Bibliography List of formulas. Appendix. Answers to examples. Index of names. Index of subjects.

Note An elementary text directed to college students who are interested in statistics and statistical methods from the standpoint of their uses in such fields as education, psychology and sociology The level of treatment does not assume high level of mathematical preparation on the part of the readers. Along with the more commonly used methods of statistical analysis wherein is assumed the normality of distribution, the author has also included methods free from the assumption on ormality of distribution, since these non-parametric methods are frequently found useful in the behavioral sciences. The author is Professor of Psychology in the University of Washington.

FEDERER, WALTER T

Experimental design theory and application. New York The Macmillan Company 1955 591 p illus 24 cm. $11 00 420

Contents Introduction. Some useful statistical tools and concepts. Plot or pen technique. The completely randomized design. Randomized complete block design. The latin square design. The choice of treatments and the factorial experiment—p^n series. Other factorial experiments. Confounding in factorial experiments. Factorial experiments with main effects confounded—split plot and split block designs with variations. Incomplete block designs—general considerations and the one-restrictional lattices with treatments in complete replicates. Lattice designs with more than one restriction on the allocation of treatments in the complete block. Other incomplete

631 p 24 cm. (Wiley publications in statistics W A. Shewhart, editor) $10 00. 431

Contents (abridged) The principles of experimental design. Elementary statistical notions. An introduction to the theory of least squares. The general linear hypothesis or multiple regression and the analysis of variance. The analysis of multiple classifications. Randomization. Latin squares. Plot technique. The analysis of randomized block and latin square experiments. Experiments involving several factors. Experiments involving factors with 3 levels. Split-plot experiments. Fractional replication. Quasifactorial or lattice and incomplete block designs. Lattice designs. Balanced incomplete block designs. Partially balanced incomplete block designs. Experiments on infinite populations and groups of experiments. Treatments applied in sequence. Appendix. Index.

Note This book complements *Experimental designs* by W G. Cochran and G. M. Cox, New York, 1950. It contains [illegible] much fuller exposition of theory and also discusses in more detail the bases of experimental design. However, it is intended primarily for the same audience, that is, advanced college students and other persons whose interest in statistics is based on their concern with experimental investigation in some field of science. For many years the author was engaged in statistical work at Rothamsted Experimental Station in England. He is now Professor of Statistics at Iowa State College.

KUHN H. W AND A. W TUCKER, editors
Linear inequalities and related systems. Princeton Princeton University Press, 1956 322 p illus. 25 cm. (Annals of mathematics studies edited by Emil Artin and Marston Morse. No. 38) $5 00. 432

Contents Dual systems of homogeneous linear relations, by A. W Tucker. Polyhedral convex cones, by A. J. Goldman and A. W Tucker. Resolution and separation theorems for polyhedral convex sets, by A. J Goldman. Theory of linear programming, by A J Goldman and A. W Tucker. On systems of linear inequalities, by K. Fan. Infinite programs, by R. J Duffin. A primal-dual algorithm for linear programs, by G. B Dantzig and others. Marginal values of matrix games and linear programs, by H. D. Mills. Determinateness of polyhedral games, by P Wolfe. On systems of distinct representatives, by A. J Hoffman and H. W Kuhn. Dilworth [illegible] theorem on partially ordered sets, by G. B. Dantzig and A. J. Hoffman. On the max-flow min-cut theorem of networks, by G. B. Dantzig and D R. Fulkerson. Integral boundary points of convex polyhedra, by A. J Hoffman and J G. Kruskal. An extension of [illegible] theorem of Dantzig, by I Heller and C. B. Tompkins. Neighboring vertices on [illegible] convex polyhedron, by D Gale. On [illegible] theorem of Wald, by H. W Kuhn. On the solution of [illegible] game-theoretic problems, by G. L. Thompson. The closed linear model of production, by D. Gale. Bibliography.

Note Certain of the papers in this collection deal with topics in the fundamental mathematics of the field, while others are devoted to problems on economic applications. All of the papers are written on an advanced mathematical level. Bibliographies for the individual papers are included. In addition, there is [illegible] general bibliography on "linear inequalities and related systems" that runs to 119 references. The collection is [illegible] contribution to linear programming and game theory.

KUHN HARRY WALDO AND ALBERT WILLIAM TUCKER, editors
Contributions to the theory of games. Princeton Princeton University Press, 1950 201 p. illus. 26 cm. (Annals of mathematics studies edited by Emil Artin and Marston Morse. Number 24) $3.00 433

Contents Part I, Finite games: The elementary theory of convex polyhedra, by H. Weyl. Elementary proof of [illegible] minimax theorem due to von Neumann, by H. Weyl. Basic solutions to discrete games, by L. S. Shapley and R. N. Snow. Solutions of finite two-person games, by D Gale and S. Sherman. Solutions of discrete two-person games, by H. F Bohnenblust and others. Solutions of games by differential equations, by G. W Brown and J. von Neumann. On symmetric games, by D Gale and others. Reduction of game matrices, by D. Gale and others. A simplified two-person poker, by H. W Kuhn. A simple three-person poker game, by J. F Nash and L. S. Shapley. Interpretation of games and strategic equivalence, by J. C. C. McKinsey. Part II, Infinite games: Operator treatment of minimax principle, by S. Karlin. On theorems of Ville, by H. F Bohnenblust and S. Karlin. Polynomial games, by M. Dresher and others. Games with continuous, convex pay-off, by H. F Bohnenblust and others. Bibliography.

—— Volume II. Princeton Princeton University Press 1953 395 p. illus. 26 cm. (Annals of mathematics studies edited by Emil Artin and Marston Morse Number 28) $4.00 434

Contents. Part I. Finite zero-sum two-person games. A certain zero-sum two-person game equivalent to the optimal assignment problem, by J. von Neumann. Two variants of poker by D B. Gillies and others. The double description method, by T S. Motzkin and others. Solutions of convex games as fixed-points, by M. Dresher and S. Karlin. Admissible points of convex sets, by K. J. Arrow and others. Part [illegible] Infinite zero-sum two-person games. Games of timing, by M. Shiffman. Reduction of certain classes of games to integral equations, by S. Karlin. On [illegible] class of games, by S. Karlin. Notes on games over the square by I. Glicksberg and O Gross. On randomization in statistical games with [illegible] terminal actions, by D Blackwell. Part III, Games in extensive form. Extensive games and the problem of information, by H. W Kuhn. Equivalence of information patterns and essentially determinate games, by N Dalkey. Infinite games with perfect information, by D. Gale and F M. Stewart. Signaling strategies in n-person games, by G. L. Thompson. Bridge and signaling, by G. L. Thompson. Sums of positional games, by J Milnor. Part IV General n-person games. A value for n-person games, by L. S. Shapley. Symmetric solutions to majority games, by R. Bott. Discriminatory and bargaining solutions to [illegible] class of symmetric n-person games, by D. B. Gillies. Quota solutions of n-person games, by L. S. Shapley. Arbitration schemes for generalized two-person games, by H. Raiffa. Bibliography.

Note Original contributions to the theory of games are published in this series. The first two volumes contain the papers whose authors and titles are listed above. The first volume contains [illegible] preface which serves as an introduction to the field, with particular regard to its status in 1950. A third volume in the series was published early in 1957

LACEY OLIVER L.
Statistical methods in experimentation, an introduction. New York The Macmillan Company 1953 249 p illus. 21 cm $4 90 435

Contents: The aim and problems of statistics in experimentation. Experimental design. Interpretation. *Probability*—The probability of discrete events—probability in [illegible] continuous. The normal distribution. Tests of significance of means and differences between means. Enumeration data. Correlation. Regression. Fiducial limits. Experimental design ( ) Appendix of tables. Index.

Note: An elementary introduction to the statistical design of experiments. It is designed for students who are interested in scientific experimentation rather than in statistical theory and those in some bias towards experimentation in the agricultural and biological sciences. The logic that underlies statistical methods is explained patiently and in elementary terms. In fact, the exposition of most points is so full and explicit that an alert reader can comprehend the book without the guidance of an instructor. Except for [illegible] note of acknowledgment to R. A. Fisher's *The design of experiments* in the preface, there are no literature references.

LEVINSON, HORACE C.
The science of chance from probability to statistics. New York Rinehart & Company 1950 348 p. illus. 20 cm. $3.50 436

Contents: Part I, Chance: Chance, luck and statistics. Gamblers and scientists. The world of superstition. Fallacies. The grammar of chance. "Heads or tails." Betting and expectation. Who is going to win? Chance and speculation. Poker chances. Poker chances and strategy. Roulette. Lotteries, craps, bridge. Part II, Statistics: From chance to statistics. Chance and statistics. Fallacies in statistics. Statistics at work. Advertising and statistics. Business and statistics. Index.

Note Elementary probability theory and applied statistics are made clear and interesting in this book for general readers. In part, this effect has been achieved by devoting [illegible] large part of the discussion to odds in gambling. Approximately half of the volume is devoted to the mathematics of chance in betting, poker, craps, etc.

sampling, and other sampling methods. Case studies—designs and results of some actual sample surveys. Appendix Table of areas under the normal curve. Index. Volume II, Theory: Introduction and definitions. Fundamental theory Operations, events and probability Random variables, expected values, variances, covariances, and convergence in probability Derivations, proofs, and some extensions of theory for corresponding chapters of Volume I Simple random sampling Stratified simple random sampling. Simple one- or more stage cluster sampling Stratified single or multi-stage cluster sampling. Control of variation in size of cluster in estimating totals, averages, or ratios. Multi-stage sampling with large primary sampling units. *Estimating variances, Regression estimates,* double sampling, sampling for time series, and other sampling methods. A theory for response errors Response errors in surveys. Index.

Note A work of major importance to anyone interested in contemporary methods of obtaining desired information by the sampling of populations. All of the authors have been associated with the Bureau of the Census of the United States Government, and two of them are still responsible for the development of sampling methods in that Bureau. The *early chapters of Volume I are a suitable* introduction to the aim, principles and problems of sampling. These can be read by anyone with an interest in the subject, whether or not he is acquainted with statistical principles and terminology The later chapters deal explicitly with practical sampling methods and are technical. This volume is concluded with detailed analysis of several sample surveys carried out by the Bureau of the Census. Mathematics is used freely in Volume I (except for the first three chapters) but the formulas are not derived and statements are not proved. The more advanced mathematical aspects of sampling are adequately covered in Volume II where derivations of formulas and proofs are rigorously given. The work is suitable for use both as textbook for advanced students who are preparing for careers in applied statistics and as a reference book and self-instruction guide for graduates already in the field.

HOLZINGER, KARL JOHN, AND HARRY H. HARMAN

Factor analysis, a synthesis of factorial methods. Chicago The University of Chicago Press 1941 417 p illus 24 cm $7.50 427

Contents Part I, Introduction Basic statistics. Geometric formulation of the factor problem. Determination of the common-factor space. Preferred types of orthogonal solutions. Part II Direct orthogonal solutions The bi-factor solution and sampling formulas. The principal-factor solution. The centroid solution. Part III, Derived solutions orthogonal and oblique Derived principal-factor solution. Orthogonal transformations and the multiple-factor solution. Oblique solution. Part IV Estimation of factors and relationships between factors *Estimation of factors.* Relationships between factor solutions. Appendixes. Bibliography Index.

Note. Concerned primarily with the exposition and synthesis of various procedures in factor analysis, this study is illustrated with examples from psychology biometry and political science. The volume is divided into five major parts th analytic and geometric foundations are first presented, leading to small number of factor solutions. Then the theory underlying each of these *types of solution is developed.* In particular the methods of Spearman, Holzinger Hotelling, Kelley and Thurstone are described. This is followed by comprehensive treatment of the methods for estimating factors, including the work of Thomson, Ledermann, and Burt. Finally in the appendixes, detailed steps are given for the calculation of any of the factor solutions described in the text.

HOUSEHOLDER, ALSTON S., AND OTHERS, editors

Monte Carlo method. Proceedings of a symposium held June 29, 30 and July 1 1949, in Los Angeles, California under the sponsorship of the *Rand Corporation* and the National Bureau of Standards with the co-operation of the Oak Ridge National Laboratory Edited by A S Householder with the assistance of G E Forsythe and H. H. Germond *Washington* D C Government Printing Office, 1951 42 p illus. 26 cm (United States National Bureau of Standards Applied mathematics series 12) $0.35 428

Content Showers produced by low-energy electrons and photons, by R. R. Wilson. An alignment chart for Monte Carlo solution of the transport problem, by B. I. Spinrad and others. Neutron age calculations in chains applied to particle transmission through matter by W C. De Marcus and L. Nelson. Stochastic methods in statistical mechanics, by G. W King. Report on a Monte Carlo calculation performed with the *Eniac*, by M Mayer Calculation of shielding properties of water for high energy neutrons, by P C. Hammer A Monte Carlo technique for estimating particle attenuation in bulk matter by B. A. Shoor and others. Estimation of particle transmission by random sampling, by H. Kahn and T E. Harris. History of RAND'S random digits—summary by G. W Brown. The mid-square method of generating digits, by P C. Hammer Generation and testing of random digits at the National Bureau of Standards, Los Angeles, by G E. Forsythe. Various techniques used in connection with random digits, by J von Neumann. Round table discussion summary by H. H. Germond.

Note Here are reprinted most of the papers presented by physicists and others at symposium held in 1949 at the University of California, Los Angeles. The audience for these papers included professional mathematical statisticians. The papers tell of initial efforts to apply the Monte Carlo method—which involves a combination of sampling theory and numerical analysis—made almost independently by number of different groups and individuals. The round-table discussion at the close of the symposium presented criticisms and suggestions and evaluation of the Monte Carlo method as contribution to the art of computing.

JOHNSON, PALMER OLIVER

Statistical methods in research New York Prentice-Hall, Inc., 1949, 377 p illus 24 cm $5 00 429

Content The realm of statistics. Probability and likelihood. Sampling distributions. The testing of statistical hypotheses. Current procedures in testing statistical hypotheses. The estimation of population parameters. Normal and normalized distributions in statistics. *Statistical analysis of data under nonnormal assumptions.* Sampling theory and practice. Analysis of variance and covariance. Applications of the analysis of variance and covariance method. The principles of experimentation. Applications of the principles of experimentation. Multiple regression problems. Appendix Table of normal distribution. *Table of t. Table of X^2 Table of F* Table of L_1 Index.

Note. An intermediate-level work designed to provide students in the biological and social sciences with the knowledge of statistical principles and techniques which are necessary in designing experiments and observational projects and in analyzing and interpreting the results. The author has assumed that the users of the book will have had a course in introductory or descriptive statistics.

KELLEY, TRUMAN LEE

The Kelley statistical tables. Revised 1948 Cambridge Mass Harvard University Press 1948 223 p illus 29 cm. $5 00 430

Contents Introductory section Bearing upon all the tables and including inverse interpolation. Table I *Eight-place normal distribution,* simple correlation, and probability functions. Table II Five-place three-point interpolation coefficients. Table III Ten-place four-point interpolation coefficients. Table IV Ten-place six-point interpolation coefficients Table *Eleven-place* eight-point interpolation coefficients. Table VI *Four-place X^2* functions. Table VII Eight-place square roots, cube roots, and natural logarithms. Table VIII Eight-place θ functions for normalizing *F* for the variance ratio. Table IX Constants frequently needed.

Note The chief object of this work is to provide statisticians with set of eight-place mathematical tables of usefulness in operations not readily accomplished with computing machines. Improvements in this edition are as follows. the original coefficient tables for direct interpolation have been replaced by more detailed tables, 3- and 4-point interpolation is now described, and complete 3x3 table of cube roots is now provided. The present volume contains approximately 100 more pages than the 1938 edition.

KEMPTHORNE, OSCAR

The design and analysis of experiments. New York John Wiley & Sons, Inc., 1952

OSTLE, BERNARD

Statistics in research basic concepts and techniques for research workers. Second edition. Ames Iowa State College Press 1954 437 p. illus. 23 cm. $6 95 442

Contents: The role of statistics in research. Basic statistical concepts. Measurement data—random sampling distributions. Attribute or enumeration data—chi-square and other methods of analysis. Mean and variance of normal populations—one or two populations. Regression analysis—I, One independent variable. Correlation methods. Regression analysis—II, Two or more independent variables. Analysis of variance—I, Completely randomized design —II, Randomized complete block and latin square designs—III. Factorials. Further applications of analysis of variance. Analysis of covariance. Other statistical techniques. Design of experimental investigations. Appendix. Bibliography. Index.

Note: An introductory textbook, developed at Iowa State College and Montana State College. It is written from a general viewpoint, with the purpose of teaching statistical methods applicable to areas of scientific research. The first two chapters are preliminary and are devoted to elementary discussions of research and scientific method, applications of statistics in research, definitions of basic statistical terms and concepts, etc. Presented as an appendix to the second chapter, so that it may be skipped by readers who lack the necessary mathematical preparation, is a compact statement of the mathematical theory that underlies frequency distributions. The majority of the chapters are devoted to describing and expounding standard statistical methods, most of which are named in the chapter titles. The final chapter is a very brief introduction to the statistical design of experiments.

PARADINE, C. G., AND B H P RIVETT

Statistics for technologists. Princeton D Van Nostrand Company Inc., 1954 285 p 23 cm. $6 75 443

Contents (abridged): Frequency distributions. Statistical parameters. Probability. The binomial distribution. Poisson distribution. The normal distribution. Sum of squares of normal variates. Continuation of it. Quality control. Sampling inspection schemes. Theory of errors. The method of least squares. Correlation. The analysis of variance. The principle of maximum likelihood. Probit analysis. Tables. Answers to examples. Index.

Note: A general introductory text for readers whose interest in statistics is practical. However, it is not limited to applications, but it covers also the basic theory and concepts. Applications in sampling, quality control, etc., are clearly explained.

RAND CORPORATION

A million random digits with 100,000 normal deviates. Glencoe, Ill. Free Press, 1955 400, 200 p. 28 cm. $10.00. 444

Note: A reference book for those who need large lists of random numbers or normal deviates for use in such techniques as the Monte Carlo method. The greater part of the space is taken up by two tables. The first one is the list of 1,000,000 random digits; the second is a list of 100,000 random normal deviates. The tables are preceded by an introduction describing the methods by which the tables were constructed to keep them free of bias and on methods of avoiding introduction of bias in using them.

SIEGEL, SIDNEY

Nonparametric statistics for the behavioral sciences. New York McGraw Hill Book Company Inc., 1956 312 p. illus. 24 cm. (McGraw Hill series in psychology Clifford T Morgan, consulting editor) $6.50. 445

Contents: Glossary of symbols. Introduction. The use of statistical tests in research. Choosing the appropriate statistical test. The one-sample case. The case of two related samples. The case of two independent samples. The case of k related samples. The case of k independent samples. Measures of correlation and their tests of significance. References. Appendix. Index.

Note: The author of this book regards the nonparametric techniques of hypothesis testing as uniquely suited to the data of the behavioral sciences. He presents the techniques in a form comprehensible by the scientist without special mathematical training and, in the appendix, includes the tables used in the application of the various tests. Of the nine chapters, six are devoted to the presentation of the nonparametric statistical tests. The first three chapters include an introduction, a discussion of the tests of hypotheses, and a discussion of the choice of the statistical technique best suited for analyzing a given batch of data, including a comparison of parametric and nonparametric statistical tests. Much space throughout the book is devoted to examples of the use of the tests. The author has assumed that the reader (1) have an understanding of elementary algebra and that he (2) have had introductory work in statistics, including descriptive statistics (means, medians, standard deviations, etc.) parametric correlational methods (including the Pearson product-moment correlation r) and the basic notions of statistical inference and their use in the t test and in the analysis of variance. The book is useful as a reference volume for psychologists, sociologists, and educators, in addition to its use in intermediate college courses.

SMITH, JAMES GERALD AND ACHESON J DUNCAN

Elementary statistics and applications. New York McGraw Hill Book Company Inc., 1944 720 p. illus. 21 cm. $6.50 446

Contents. Part I, Introduction: Statistics in the arts and sciences. Gathering statistics. Sources of statistics. Presentation of statistics. Statistics—a study of variation. Part II, Analysis of frequency distribution: Summarization and comparison. Illustration of frequency-distribution analysis. Part III, The normal frequency curve: Probability. Probability distributions. Probability calculus. Symmetrical binomial distribution and the normal curve. Use of the normal frequency curve in sampling analysis. Part IV, Study of bivariates and multivariates: Simple correlation. Computation of and other measures of correlation. Nonlinear correlation. Multiple and partial correlation. Analysis of multivariate frequency distributions illustrated. Normal frequency surface. Part V, Study of dynamic variability: Index numbers. Rational basis of the analysis of time series. Trend analysis. Orthogonal polynomial trends. Time-series analysis—seasonal variation. Determination of cycle. Part VI, Forecasting: The art of forecasting with statistics. Appendix. Tables. Author index. Subject index.

Note: A thorough and detailed treatment of the fundamentals, designed for a beginning college course. The developments of frequency-distribution, correlation, and time-series analysis are first completed in their simplest aspects, with elementary illustrations, enabling the student to visualize basic methods. More complex illustrations of practical application are then given in separate chapters or sections. Mathematical exposition is kept on a level with a practical knowledge of elementary algebra, although the concept of the differential is introduced in the latter third of the book.

SNEDECOR, GEORGE W

Statistical methods applied to experiments in agriculture and biology Fifth edition. Ames Iowa State College Press, 1956 534 p. illus. 23 cm. $7.50 447

Contents: Sampling of attributes—binomial distribution. Sampling from a normally distributed population—sampling distributions. The comparison of two randomized groups. Short cuts and approximations—less than fully efficient and non-parametric methods. Linear regression. Correlation. Large sample methods. Enumeration data with more than one degree of freedom. Two or more random samples of measurement data—analysis of variance. Two-way experiments—analysis of variance. Comparisons—factorial arrangements of treatments. Covariance. Multiple regression and covariance. Curvilinear regression. Binomial and Poisson distributions. Design and analysis of samplings, by W. G. Cochran. Index of mathematical tables. General index and index of symbols.

Note: A standard textbook and working manual, the first edition of which was published in 1937 and the fourth edition in 1946. It is addressed, as indicated in the title, to readers who are doing research in agriculture and biology or who are preparing for such research. It is organized for use as a textbook in organized college courses; however, because of such features as an explicit and full expository text, numerous worked examples, and a great variety of tables, practical research workers find it useful also. In this edition, among the more important changes are an extensive presentation of factorial experiments, a new chapter on the design and analysis of sampling written by William G. Cochran, and references to the recent literature.

The remainder is concerned with elementary statistical theory and the applications of statistics in business and other fields. The book is written in a simple, readable style, and contains much more narrative text than mathematical expression. The first edition, published in 1939 was entitled *Your chance to win*

McKinsey, J C C

Introduction to the theory of games The Rand Corporation New York McGraw Hill Book Company, Inc., 1952 571 p illus 24 cm. (The Rand series) $6 50 437

Content Rectangular games. The fundamental theorem for rectangular games. The solutions of a rectangular game. A method of approximating the value of game. Games in extensive form. Games in extensive form—general theory Games with infinitely many strategies. Distribution functions. Stieltjes integrals. The fundamental theorem for continuous games. Separable games. Games with convex payoff functions. Applications to statistical inference. Linear programming. Zero-sum *n*-person games. Solution of *n*-person games. Games without zero-sum restriction—the von Neumann-Morgenstern theory Some open problems. Bibliography Index.

Note. The subject f this work is the mathematical theory of games and strategy The theory has application not only to such games as chess and poker but also to military strategy certain problems related to business competition, etc. However applications are not stressed. The book is addressed to college students who have knowledge of introductory calculus and classical algebra. Other mathematical concepts, such as the properties of matrices and distribution functions, are explained in the book.

Mann, H B

Analysis and design of experiments, analysis of variance and analysis of variance designs New York Dover Publications, Inc., 1949 198 p 20 cm. (The Dover series in mathematics and physics, W Prager, consulting editor) $1 45 438

Contents. Chi-square distribution and analysis of variance distribution. Matrices, quadratic forms and the multivariate normal distribution. Analysis of variance in a one way classification. Likelihood ratio tests and tests of linear hypotheses. Analysis of variance in an *r*-way classification design. The power of analysis of variance tests. Latin squares and incomplete balanced block designs. Galois fields and orthogonal Latin squares. The construction of incomplete balanced block designs. Non-orthogonal data. Factorial experiments. Randomized designs, randomized blocks and quasifactorial designs. Analysis of covariance. Interblock estimates and interblock variance. Tables.

Note. A brief but good introduction to statistical methods which are applicable to the design of scientific experiments. The author had three groups of readers in mind mature mathematicians who wish to acquire an understanding of the analysis of variance and of variance designs, advanced undergraduates and graduate college students in need of short textbook, and practical experimenters and statisticians who wish to grasp the mathematical principles and methods underlying the statistical application. The exposition sticks closely to the bare essentials of the subject. Frequent references are made to other books in which fuller treatments of basic mathematical concepts and techniques are available.

Meyer, Herbert A., editor

Symposium on Monte Carlo methods held at the University of Florida, conducted by the Statistical Laboratory sponsored by Wright Air Development Center of the Air Research and Development Command, March 16 and 17, 1954 New York John Wiley & Sons Inc., 1956 382 p illus 29 cm (Wiley publications in statistics Walter A Shewhart and Samuel S Wilks editors) $7 50 439

Contents Part I, Papers in order of presentation An introductory note, by A. W Marshall. Generation of pseudo random numbers, by O. Taussky and J Todd. Phase shifts—middle squares—wave equation, by N Metropolis. A general theory of stochastic estimates of the Neumann series for the solution of certain Fredholm integral equations, by G E. Albert. Neighbor sets for random walks and difference equations, by T S. Motzkin. Monte Carlo computations, by N M. Dismuke. Applications of Monte Carlo methods to tactical games, by S. Ulam. Conditional Monte Carlo for normal samples, by H. F Trotter and J W Tukey Monte Carlo technique in complex problem about normal samples, by H. J Arnold and others. An application of the Monte Carlo method to a problem in gamma ray diffusion, by M. J Berger Stochastic calculations of gamma ray diffusion, by L. A. Beach and R. B. Theus. Application of multiple stage sampling procedures in Monte Carlo problems, by A. W Marshall. Questionable usefulness of variance for measuring estimate accuracy in Monte Carlo importance sampling problems, by J E. Walsh. Experimental determination of eigenvalues and dynamic influence coefficients for complex structures such as airplanes, by C. W Vickery Use f different Monte Carlo sampling techniques, by H. Kahn. A theoretical comparison of the efficiencies of two classical methods and a Monte Carlo method for computing one component of the solution of set of linear algebraic equations, by J H. Curtiss. A description of the generation and testing of set of random normal deviates, by E. J Lytle, Jr. Machine sampling from given probability distributions, by J W Butler A Monte Carlo technique for obtaining tests and confidence intervals for insurance mortality rates, by J. E. Walsh. Experiments and models for the Monte Carlo method, by A. Walther. Part II, Bibliography Name index. Source index. Other references. Subject index.

Note. The papers that have been collected in this volume were largely revised, following their original presentation and now incorporate the fruit of questions, remarks and discussions which followed the presentation. In some papers, therefore, developments later than 1954 are to be found, and citations to literature published as recently as 1956 are given. The authors are specialists and, generally speaking, they addressed themselves to other specialists. However considerable number of the papers deal with applications and are of potential value to engineers and applied mathematicians with practical interests in Monte Carlo methods. The introductory note by Marshall is an outline survey of the development of Monte Carlo methods and f the present state of the field. It includes helpful comments on papers in the volume. The bibliography is extensively annotated.

Molina, Edward Charles

Poisson s exponential binomial limit. Table I Individual terms Table II Cumulated terms New York D Van Nostrand Company, Inc., 1942 45 p 28 cm $3 50 440

Note The tables in this standard reference book were calculated in the Bell Telephone Laboratories for use in trunk line problems and quality control. Their primary use is to reduce the work of calculation in the probability study and analysis of data derived from inspection

Morse, Philip McCord, and George E Kimball

Methods of operations research. First edition revised New York Published jointly by The Technology Press of Massachusetts Institute of Technology and John Wiley & Sons, Inc. 1951 158 p illus 28 cm $5.50 441

Contents Introduction. Probability The use f measures of effectiveness. Strategical kinematics. Tactical analysis. Gunnery and bombardment problems. Operational experiments with equipment and tactics. Organizational and procedural problems. Tables. Bibliography Index.

Note. This book deals with the application of statistical techniques to the evaluation of specific alternative procedures in military strategy business operations, etc. During World War II the techniques explained were applied to such varied operations as the depth bombing of submarines and the protection of ships against Japanese suicide planes. Though most of the examples given in this book are drawn from military and naval applications, the general principles and the methods described are fully applicable to variety of problems in administration. From this standpoint the book is of interest to industrial engineers, business executives, and also to scientists concerned with the planning of experiments.

OSTLE BERNARD

Statistics in research basic concepts and techniques for research workers. Second edition. Ames Iowa State College Press, 1954 487 p. illus 23 cm. $6 95 442

Contents: The role of statistics in research. Basic statistical concepts. Measurement data—random sampling distributions. Attribute or enumeration data—chi-square and other methods of analysis. Mean and variance of normal populations—one or two populations. Regression analysis—I, One independent variable. Correlation methods. Regression analysis—II, Two or more independent variables. Analysis of variance—I, Completely randomized design—II, Randomized complete block and latin square designs—III, Factorials. Further applications of analysis of variance. Analysis of covariance. Other statistical techniques. Design of experimental investigations. Appendix. Bibliography Index.

Note: An introductory textbook, developed at Iowa State College and Montana State College. It is written from general viewpoint, with the purpose of teaching statistical methods applicable in areas of scientific research. The first two chapters are preliminary and are devoted to elementary discussions of research and scientific method, applications of statistics in research, definitions of basic statistical terms and concepts, etc. Presented as an appendix to the second chapter, so that it may be skipped by readers who lack the necessary mathematical preparation, is compact statement of the mathematical theory that underlies frequency distributions. The majority of the chapters are devoted to describing and expounding standard statistical methods, most of which are named in the chapter titles. The final chapter is very brief introduction to the statistical design of experiments.

PARADINE, C G AND B H. P RIVETT

Statistics for technologists. Princeton D Van Nostrand Company Inc., 1954 285 p. 23 cm. $6.75 443

Contents (abridged): Frequency distributions. Statistical parameters. Probability. The binomial distribution. Poisson's distribution. The normal distribution. Sum of squares of normal variates. Goodness of fit. Quality control. Sampling inspection schemes. Theory of errors. The method of least squares. Correlation. The analysis of variance. The principle of maximum likelihood. Probit analysis. Tables. Answers to examples. Index.

Note: A general introductory text for readers whose interest in statistics is practical. However, it is not limited to applications, but it covers also the basic theory and concepts. Applications in sampling, quality control, etc are clearly explained.

RAND CORPORATION

A million random digits with 100,000 normal deviates. Glencoe, Ill. Free Press, 1955 400 200 p. 28 cm. $10.00. 444

Note: A reference book for those who need large list of random numbers or normal deviates for use in such techniques as the Monte Carlo method. The greater part of the space is taken up by two tables. The first one is the list of 1,000,000 random digits; the second is list of 100,000 random normal deviates. The tables are preceded by an introduction describing the methods by which the tables were constructed to keep them free of bias and on methods of avoiding introduction of bias in using them.

SIEGEL, SIDNEY

Nonparametric statistics for the behavioral sciences. New York McGraw Hill Book Company Inc., 1956 312 p. illus. 24 cm. (McGraw Hill series in psychology Clifford T Morgan, consulting editor) $6.50. 445

Contents: Glossary of symbols. Introduction. The use of statistical tests in research. Choosing an appropriate statistical test. The one-sample case. The case of two related samples. The case of two independent samples. The case of k related samples. The case of k independent samples. Measures of correlation and their tests of significance. References. Appendix. Index.

Note: The author of this book regards the nonparametric techniques of hypothesis testing as uniquely suited to the data of the behavioral sciences. He presents the techniques in terms comprehensible by the scientist without special mathematical training and, in the appendix, includes the tables used in the application of the various tests. Of the nine chapters, six are devoted to the presentation of the nonparametric statistical tests. The first three chapters include an introduction, discussion of the tests of hypotheses, and discussion of the choice of the statistical technique best suited for analyzing given batch of data, including comparison of parametric and nonparametric statistical tests. Much space throughout the book is devoted to examples of the use of the tests. The author has assumed that the reader [illegible] have an understanding of elementary algebra and that he will have had introductory work in statistics, including descriptive statistics (means, medians, standard deviations, etc.) parametric correlational methods (including the Pearson product-moment correlation) and the basic notions of statistical inference and their use in the *t* test and in the analysis of variance. The book is useful as reference volume for psychologists, sociologists, and educators, in addition to its use in intermediate college courses.

SMITH, JAMES GERALD AND ACHESON J DUNCAN

Elementary statistics and applications. New York McGraw Hill Book Company, Inc., 1944 720 p illus. 21 cm. $6.50 446

Contents: Part I, Introduction. Statistics in the arts and sciences. Gathering statistics. Sources of statistics. Presentation of statistics. Statistics—a study of variation. Part II, Analysis of frequency distribution Summarization and comparison. Illustration of frequency-distribution analysis. Part III, The normal frequency curve: Probability Probability distributions. Probability calculus. Symmetrical binomial distribution and the normal curve. Use of the normal frequency curve in sampling analysis. Part IV, Study of bivariate and multivariate: Simple correlation. Computation of and other measures of correlation. Nonlinear correlation. Multiple and partial correlation. Analysis of multivariate frequency distribution. Continued. Normal frequency surface. Part [illegible] Study of dynamic variability: Index numbers. Rational basis of the analysis of time series. Trend analysis. Orthogonal-polynomial trends. Time-series analysis—seasonal variation. Determination of cycle. Part VI, Forecasting: The art of forecasting with statistics. Appendix. Tables. Author index. Subject index.

Note: A thorough and detailed treatment of the fundamentals, designed for beginning college course. The description of frequency-distribution, correlation, and time-series analysis are first completed in their simplest aspects, with elementary illustrations, enabling the student to visualize basic methods. More complex illustrations of practical application are then given in separate chapters or sections. Mathematical exposition is kept on level with practical knowledge of elementary algebra, although the concept of the differential is introduced in the latter third of the book.

SNEDECOR, GEORGE W

Statistical methods applied to experiments in agriculture and biology Fifth edition. Ames Iowa State College Press 1956. 534 p. illus. 23 cm. $7.50 447

Contents: Sampling of attributes—binomial distribution. Sampling from normally distributed population—sampling distributions. The comparison of two randomized groups. Short cuts and approximations—less than fully efficient and non-parametric methods. Linear regression. Correlation. Large sample methods. Enumeration data with more than one degree of freedom. Two or more random samples of measurement data—analysis of variance. Two-way arguments—analysis of variance. Comparisons—factorial arrangements of treatments. Covariance. Multiple regression and covariance. Curvilinear regression. Binomial and Poisson distributions. Design and analysis of samplings, by W G Cochran. Index of mathematical tables. General index and index of symbols.

Note: A standard textbook and working manual, the first edition of which was published in 1937 and the fourth edition in 1946. It is addressed, as indicated in the title, to readers who are doing research in agriculture and biology or who are preparing for such research. It is organized for use as textbook in organized college courses however, because of such features as its explicit and full expository text, numerous worked examples, and great variety of tables, practical research workers find it useful also. In this edition, among the more important changes, are an extensive presentation of factorial experiments, new chapter on the design and analysis of sampling written by William G. Cochran, and references to the recent literature.

SPEAR, MARY ELEANOR

Charting statistics New York McGraw Hill Book Company, Inc., 1952 253 p illus. 24 cm. $4 75 448

Contents Graphic presentation. Planning the chart. Line charts. The surface chart. Column charts. The bar chart. The map chart. Other types and their use. Exhibits. Duplicating, color, television. Index.

Note. Scientists, engineers, and their technicians are often faced with problems in the graphical presentation of data. In this useful book the various types of charts are described and illustrated, and the construction of each type is clearly explained. Also, there is helpful advice on selecting the type of chart, determining its size, etc.

THRALL, R M , AND OTHERS, editors

Decision processes Edited by R M. Thrall, C H Coombs and R. L Davis New York John Wiley & Sons, Inc., 1954 332 p illus 23 cm. $5 00 449

Contents Introduction, by R. L. Davis. Mathematical models and measurement theory by C. H. Coombs and others. Part I, Individual and social choice On methods of amalgamation, by L. A. Goodman Games against nature, by J Milnor Note on some proposed decision criteria, by R. Radner and J Marschak. Social choice and strength of preference, by C. H. Coombs. Alternative calculi of subjective probabilities, by S. Vail. Part II Learning theory: A formal structure for multiple-choice situations, by R. R. Bush and others. Individual behavior in uncertain situations—an interpretation in terms of statistical association theory by W K. Estes. Game-learning theory and some decision-making experiments, by M M Flood. Part III, Theory and applications of utility Representation of a preference ordering by a numerical function, by G. Debreu. Multidimensional utilities, by M. Hausner Applications of multidimensional utility theory by R. M Thrall. Towards an economic theory of organization and information by J Marschak. The logical structure of the utility concept, by H. G. Bohnert. Part IV Experimental studies. Tendencies toward group comparability in competitive bargaining, by P Hoffman and others. On decision-making under uncertainty by C. H. Coombs and D Beardslee. Environmental non-stationarity in a sequential decision-making experiment, by M. M. Flood. Some experimental n-person games, by G. Kalisch and others. Appendixes List of participants in the University of Michigan Summer Seminar at Santa Monica, California—Summer 1952 Papers presented.

Note: A collection of original papers directed at the "application of mathematics to behavioral sciences in general and at decision processes in particular The emphasis on the development of decision theory in matrix of the social sciences is obvious from the chapter titles. However in spit of this planned emphasis, many of the papers are purely mathematical in content, and the social applications are not explicitly delineated. The book is an outgrowth of a seminar sponsored by the University of Michigan and held at Santa Monica, California, in the summer of 1952 However it includes some papers not presented at the seminar and, according to the editors, many of the papers presented at the seminar have been extended to include research carried out since. The book is pic ture of research in progress and of theory undergoing formulation rather than a definitive treatise.

VON NEUMANN JOHN, AND OSKAR MORGENSTERN

Theory of games and economic behavior Third edition Princeton Princeton University Press 1953 641 p illus 24 cm $12 50 450

Contents Formulation of the economic problem. General formal description of games to strategy Zero-sum two-person games—theory—examples. Zero-sum three-person games. Formulation of the general theory—zero-sum n-person games. Zero-sum four person games. Some remarks concerning ≥ 5 participants. Composition and decomposition of games. Simple games. General non-zero-sum games. Extension of the concepts of domination and solution. Appendix. Index of figures. Index of names. Index of subjects.

Note This is the foundation book on the mathematical theory of games. It was first published in 1944 and second edition was published in 1947 The second edition differed from the first, largely in the addition of the appendix containing mathematical proof. The third edition differs from the second only in the correction of misprints and in the addition of selected bibliography of recent books on game theory

WALD, ABRAHAM

Sequential analysis New York John Wiley & Sons Inc , 1947 212 p. illus. 24 cm. $6 50 451

Contents. Part I, General theory: Elements of the current theory of testing statistical hypotheses. Sequential test of statistical hypothesis—*general discussion.* The sequential probability ratio test for testing simple hypothesis H_0 against a single alternative H Outline of a theory of sequential tests of simple and composite hypotheses against set of alternatives. Part II, Application of the general theory to special cases. Testing the mean of a binomial distribution (acceptance inspection of a lot where each unit is classified into one of two categories) Testing the difference between the means of two binomial distributions (double dichotomies) Testing that the mean of normal distribution with known standard deviation falls short of given value. Testing that the standard deviation f normal distribution does not exceed a given value. Testing that the mean of normal distribution with known variance is equal to specified value. *Part III,* The problem of multi-valued decisions and estimation The choice of a hypothesis from set of mutually exclusive hypotheses (multi-valued decision) The problem of sequential estimation. Appendices. Index.

Note. A presentation f the theory of the sequential probability ratio test, test which was devised by the author and first described in restricted report submitted by the Statistical Research Group of Columbia University to the National Defense Research Committee in September 1943 and which was subsequently the subject of further research by the Group and the basic content of several reports. The exposition here is intended for professional statisticians and for other persons concerned with statistical interpretation of samples and experimental data. Theory and application are discussed and, in the third part of the book, the possibility and problems of extending the theory to multi-valued decisions are explored briefly The book is written in technical language and rather advanced mathematics.

WALKER, HELEN M , AND JOSEPH LEV

Statistical inference. New York Henry Holt and Company 1953 510 p illus. 24 cm. $6 75 452

Contents Inferences based on simple experiments. Probability distributions. Inferences concerning proportions. Chi-square. Populations and samples on continuous variable. Sampling distributions. Inferences concerning the mean or the difference between two means. Inferences concerning variances and standard deviations of normal populations. Analysis of variance. Linear regression and correlation. Other measures of relationship. The statistics of measurement. Multiple regression and correlation. Analysis of variance with two or more variables of classification. Analysis of covariance. Percentiles. Transformation of scales Non-parametric methods, by L. Moses Tests for comparison of two samples. Comparison of *k* samples. Confidence intervals. Tests of independence. *Appendix* Tables and charts. Glossary of symbols. Answers to problems. Index to subject matter Index of authors.

Note. This is textbook for two-semester college course. The point-of view of the authors in the relation of sample to population thus, the work is especially applicable to the statistical problems met in sociology education and related fields. The concept of inference is introduced in the first chapter by the use of simple samples. Thereafter the student is gradually led to make his own inferences without complex mathematics or even tables. Elementary computations are brought into the text as needed. N previous college training in mathematics is required for an understanding of the text. Practice exercises and bibliographical references are included.

WALLIS, W ALLEN, AND HARRY V ROBERTS

Statistics a new approach Glencoe Ill. The Free Press 1956 646 p illus. 24 cm. $6 00 453

Contents. Part I, The nature of statistics The field of statistics. Effective uses of statistics. Misuses of statistics. Basic ideas. Observation and measurement. Part II, Statistical description The art of organizing data. Averages. Variability Association. Part III, Statistical inference. Randomness and probability Sampling distributions of the normal distribution Statistical tests and decision procedures. Further test procedures. Estimation. Part IV Special topics Design of investigations. Statistical quality control. Relationships between variables. Time series. Shortcuts. Appendix Squares and square roots. Random numbers. Index.

Note: A substantial descriptive treatment, designed to give the reader knowledge of the nature and general content of statistics rather than to prepare him to become [illegible] statistician. The mathematical level is about that of a good course in high-school algebra. A large number of examples drawn from many fields of application are included in the expository text and the problems for the student to solve represent [illegible] similar variety of applications. The style is not only readable but lively; even the problems appended to the chapters are entitled "Do it yourself."

WAX, NELSON, editor

Selected papers on noise and stochastic processes. New York Dover Publications, Inc., 1954 369 p. illus 24 cm. $2.25 454

Contents: Stochastic problems in physics and astronomy, by S. Chandrasekhar. On the theory of the Brownian motion, by G. E. Uhlenbeck and L. S. Ornstein. On the theory of the Brownian motion II, by M. C. Wang and G. E. Uhlenbeck. Mathematical analysis of random noise, by S. O. Rice. Wax and the theory of Brownian motion, by M. Kac. The Brownian movement and stochastic equations, by J. L. Doob.

Note: A collection of basic articles for graduate students of physics, graduate physicists, communications engineers, and other scientists and technologists [illegible] in the mathematical theory and analysis of random processes. All of the papers are reprints, and nothing new has been added except the preface which also contains [illegible] selected list of the literature pertaining to the field. There is no index.

WILLIAMS, J D

The compleat strategyst being a primer on the theory of games of strategy With pictorial illustrations by Charles Satterfield. New York McGraw-Hill Book Company Inc., 1954 234 p. illus. 24 cm. $4.75 455

Contents: Introduction. Two-strategy games. Three-strategy games. Four-strategy games and larger ones. Miscellany. Appendix. Table of random digits. Solutions to exercises. Index.

Note: [illegible]

WORTHING, ARCHIE GARFIELD AND JOSEPH GEFFNER

Treatment of experimental data. New York John Wiley and Sons Inc., 1943 342 p. illus. 23 cm. $6.00 456

Contents: Representation of data by tables. Representation of data by graphs. Representation of data by equations. Tabular and graphical differentiation and integration. Fourier series. The normal frequency distribution. [illegible]

Note: [illegible]

TOPOLOGY

BIRKHOFF, GARRETT

Lattice theory Revised edition. New York American Mathematical Society 1948. 283 p. 26 cm. (American Mathematical Society Colloquium publications Vol. XXV) $6.00 457

Contents: Partially ordered sets. Lattices. Chains and chain conditions. Complete lattices. Modular lattices. Applications to algebra. [illegible] Boolean algebras. Applications to set theory. Applications to logic and probability. [illegible] Vector lattices. Ergodic theory. Bibliography. Subject index. Author index.

Note: The first edition appeared in 1940. In the past [illegible] years the new subject of lattice theory has been undergoing rapid development. [illegible]

CHEVALLEY, CLAUDE

Theory of Lie groups I. Princeton Princeton University Press 1946 217 p illus. 23 cm. (Princeton mathematical series editors Marston Morse and A. W. Tucker) $2.75 458

Contents: The classical linear groups. Topological groups. Manifolds. Analytic groups. Lie groups. The differential calculus of Cartan. Compact Lie groups and their representations. Index.

Note: [illegible]

EILENBERG, SAMUEL, AND NORMAN STEENROD

Foundations of algebraic topology. Princeton Princeton University Press 1952 328 p. 24 cm. (Princeton mathematical series editors, Marston Morse and A. W. Tucker No. 15) $7.50. 459

Contents: [illegible] Index.

Note: [illegible]

GOTTSCHALK, WALTER HELBIG AND GUSTAV ARNOLD HEDLUND

Topological dynamics. Providence American Mathematical Society 1955 151 p. illus. 26 cm. (American Mathematical Society Colloquium publications Vol. XXXVI) $5.10 460

Contents Transformation groups. Orbit-closure partitions. Recursion. Almost periodicity Regular almost periodicity Replete semi-groups. Recurrence. Incompressibility Transitivity Asymptoticity Function spaces. Symbolic dynamics. Geodesic flows of manifolds of constant negative curvature. Cylinder flows and a planar flow Bibliography Index.

Note The authors of this book have defined its subject as follows " by *topological dynamics* we mean the study of transformation groups with respect t those topological properties whose prototype occurred in classical dynamics. Thus the word 'topological' in the phrase 'topological dynamics' has reference to mathematical content and the word dynamics in the phrase has primary reference to historical origin. The historical origin is of course the work of H. Poincaré, in solving problems in dynamics by the topological approach. The book is addressed to graduate mathematicians, including graduate students of mathematics, who have a basic knowledge of group theory topology and topological groups.

HALL, DICK WICK, AND GUILFORD L SPENCER II

Elementary topology New York John Wiley & Sons, Inc , 1955 303 p illus. 24 cm. $7 00 461

Contents, Introductory set theory The real line. Topological spaces. Metric spaces. Arcs and curves. Partitionable spaces. The axiom of choice. List of special symbols. Index.

Note A new college textbook specifically designed for undergraduate study Although elementary it is mathematically rigorous. Theorems are proved, and in most instances the proof is exceptionally detailed. The authors are members of the faculty of the University of Maryland.

HALMOS, PAUL R.

Finite dimensional vector spaces Princeton Princeton University Press, 1942 195 p 22 cm. (Annals of mathematics studies No 7) $3 00 462

Contents (abridged) Spaces Definition of vector space. Comments on notation and terminology Definition of linear dependence. Characterization of linear dependence. Dimension of vector space. Linear manifolds. Calculus of linear manifolds. Conjugate space. Direct sums. Transformations Definitions and examples of linear transformations. Definition of matrices. Isomorphism between matrices and operators. Reducibility Projections. Adjoint operators. Range and null space of linear transformation. Super diagonal form. Orthogonality Concept of an inner product. Formal definition of unitary space. Applications of Schwarz's inequality Projection theorem. Hermitian transformations. Cayley transform. Spectral theorem for Hermitian polar decomposition. Minimax principle. Ergodic theorem for unitary transformations. Power series. Appendices. Bibliography List of notations. Index of definitions.

Note Addressing the advanced undergraduate or beginning graduate student, the author treats linear transformations on finite dimensional vector spaces by the methods of more general theories than the Hilbert space theory and elementary matrix theory The purpose is to emphasize the simple geometric notions common to many parts of mathematics and their applications. The bibliography lists 14 books on the subject.

HUREWICZ, WITOLD, AND HENRY WALLMAN

Dimension theory Princeton Princeton University Press, 1941 165 p 23 cm (Princeton mathematical series 4) $3 75 463

Contents Introduction Dimension 0 Dimension n. Dimension of Euclidean spaces. Covering and imbedding theorems. Mappings in spheres and applications. Dimension and measure. Homology and dimension. Appendix Non-separable metric spaces. Index.

Note In this book it has been the aim of the authors to give a connected and simple account of the most essential parts of dimension theory Only those topics were chosen which are of interest to the general worker in advanced mathematics, as well as the specialist in topology Since the appearance of Karl Menger's *Dimensionstheorie* in 1928, there have occurred important advances in the theory in both content and method. These advances justify new treatment, and in the present book emphasis has been laid on the modern techniques of function spaces and mappings in spheres.

KELLEY, JOHN L

General topology Princeton D Van Nostrand Company, Inc., 1955 298 p. illus 24 cm (The university series in higher mathematics, editorial board, M H Stone and others) $8 75 464

Contents Preliminaries. Topological spaces. Moore-Smith convergence. Product and quotient spaces. Embedding and metrization. Compact spaces. Uniform spaces. Function spaces. Appendix Elementary set theory Bibliography Index.

Note. The title notwithstanding, this book is an introductory exposition of portions of topology selected for their relevance to modern analysis. The author himself has stated, "I have, with difficulty been prevented by my friends from labeling it What Every Young Analyst Should Know Considerable attention is given to recent contributions to topological theory The book is organized for use as a graduate-level text but is of interest also to mathematicians who have completed their formal academic study The first chapter entitled Preliminaries, covers number of basic definitions and theorems. The contents of the other chapters and of the appendix are indicated by their titles, listed above. The bibliography is 10 pages long. The author is Professor of Mathematics in the University of California.

LEFSCHETZ, SOLOMON

Algebraic topology New York American Mathematical Society, 1942 389 p 26 cm (American Mathematical Society Colloquium publications. Vol XXVII) $4 40 465

Contents Introduction to general topology Additive groups. Complexes. Complexes Products. Transformations. Subdivision. Complexes. Multiplications and intersections. Fixed elements. Manifolds. Nets of complexes. Homology theory l topological spaces. Topology of polyhedra and related questions. Appendices On homology groups of infinite complexes and compacta, by Samuel Eilenberg and Saunders MacLane. *Fixed points of periodic transformations*, by P A. Smith. Bibliography Indexes.

Note. This volume is intended as a modernized version of the author's *Topology* New York, 1930 out of print for some time. In line with recent progress, the foundations have grown from three pages to two chapters, and an extensive algebraic theory of complexes has largely displaced manifolds. The algebraic techniques thus made available is utilized first to unify the homology theories of topological spaces and then also in connection with the applications to polyhedra and related questions. The book concludes with appendices by Eilenberg-MacLane on their recent results on infinite complexes, and by Paul Smith on his theory of fixed points of periodic transformations.

LEFSCHETZ, SOLOMON

Introduction to topology Princeton Princeton University Press 1949 218 p illus. 24 cm. (Princeton mathematical series edited by Marston Morse and others) $4.50 466

Contents. Introduction. survey of some topological concepts Basic information about sets, spaces, vectors, groups. Two-dimensional polyhedral topology Theory of complexes. Transformations of complexes—simplicial approximations and related *questions. Further* properties of homotopy—fixed points—fundamental group—homotopy groups. Introduction to manifolds—duality theorems. Bibliography List of symbols. Index.

Note. A text designed for the use of graduate students of mathematics. The first three chapters survey the basic concepts of topology with emphasis on the principles of algebraic topology The remainder of the volume is concerned with the *fundamentals* f polyhedral topology Because of the introductory nature of the book the author has not attempted to include proofs for *all* propositions. Review problems are given in each chapter and the references cited in the bibliography are limited to those which will be f value to the beginner in topology

Lefschetz, Solomon

Topics in topology Princeton Princeton University Press, 1942 137 p. 22 cm. (Annals of mathematics studies No. 10) $2.00. 467

Contents: Polytopes. Singular complexes. Mapping and imbedding theorems. Retraction. Local connectedness and related topics. Special bibliography. General bibliography. Index.

Note: This monograph has been planned as a companion volume to Lefschetz's *Algebraic topology*, New York, 1942 (see above); the topics dealt with in both texts having for common denominator the relations between polytopes and general topology. The second chapter of the present work completes in certain important points the treatment of singular elements given in the volume referred to. In addition to a supplementary bibliography of general works, there is also given a fairly comprehensive bibliography on locally connected spaces and retraction, containing 48 references, mainly foreign.

Loomis, Lynn H.

An introduction to abstract harmonic analysis. Princeton D Van Nostrand Company Inc., 1953 190 p. 24 cm. (The university series in higher mathematics editorial board, M. H. Stone chairman) $5.50 468

Contents: Topology. Banach spaces. Integration. Banach algebras. Some special Banach algebras. The Haar integral. Locally compact Abelian groups. Compact groups and almost periodic functions. Some further developments. Bibliography. Index.

Note: Harmonic analysis of groups is presented as an application of Banach algebras in this work. The first three chapters—preliminary to the main part of the book—are concise though mathematically rigorous developments of selected ideas in topology, Banach space theory, etc. In the third and fourth chapters, the theory of Banach algebras, including some special Banach algebras, is developed, and in succeeding chapters, applications to groups are developed. The final chapter provides a brief view of certain interesting developments, and also of some of the field in need of further study. The author is Associate Professor of Mathematics at Harvard University.

Montgomery, Deane and Leo Zippin

Topological transformation groups. New York Interscience Publishers, Inc. 1955 282 p. 23 cm. $6.00 469

Contents: Topological spaces and groups. Locally compact groups. Groups with no small subgroups. Approximation by Lie groups. Transformation groups. Compact transformation groups. Bibliography. Index.

Note: The six chapters of this book fall into two rather distinct groups. The first four deal with the relation of locally compact groups to Lie groups. They cover the basic notions, the historical development through the classical period, and the new methods. As to the final chapter, the authors themselves have stated that "the last two chapters rely on material not expounded in the book, using a few basic results from homology theory, dimension theory and fibre mappings. . . . Since this part of the field is not near its final form, it is perhaps better to leave to a later date an attempt at a complete and detailed exposition." However, the reader is given a view of the state of affairs at the time the book was written and references to the significant papers.

Radó, Tibor

Length and area. New York American Mathematical Society 1948 572 p illus. 26 cm. (American Mathematical Society Colloquium publications. Vol. xxx) $6.75 470

Contents (abridged): Part i, Background material. Background in topology. Background in analysis. Part ii, Curves and surfaces. Continuous transformations of Fréchet spaces. Cyclic decomposition. The topological index. Part iii, Arc length and related topics. Interval functions. Bounded variation and absolute continuity. Arc length. Part iv, Plane transformations. Topological foundations. Metric foundations. Derivatives and Jacobians. Special classes of transformations. Part v, Surface area. The lower area $a(S)$. The Lebesgue area $A(S)$. Surfaces of the form $z = f(x, y)$. Bibliography. Index.

Note: A thorough study of the mathematical meaning of the terms "curve," "surface," "length," and "area." Its objects are to arrive at more precise definitions of these terms, to point out the problems for which solutions have not yet been found, and to explore the application to other mathematical fields of the concepts and formulas evolved. The author states that his theories are based on the fundamental ideas of Lebesgue and Geöcze. The treatise is of special interest to mathematicians working in analysis and in topology. The bibliography appears to cite all of the international literature which bears on the subject.

Schatten, Robert

A theory of cross-spaces. Princeton Princeton University Press 1950 153 p. 25 cm. (Annals of mathematics studies Emil Artin and Marston Morse editors. Number 26) $2.50 471

Contents: Introduction. Notations and conventions. The algebra of expressions $\sum f_i \otimes g_i$. Crossnorms. Cross-spaces of operators. Ideals of operators. Crossed unitary spaces. Appendix i. Reflexive crossnorms. Reflexive cross-spaces. "Limited" crossnorms. Appendix ii. A self-associate crossnorm. References.

Note: The problem attacked in this study is: Given two linear vector spaces L_1 and L_2, is it possible to construct a linear vector space, say denoted with the symbol $L_1 \otimes L_2$, of formal products $f \otimes g$, for which the distributive multiplication laws hold? The discussion is on an advanced mathematical level.

Schilling, Otto Francis George

The theory of valuations. New York American Mathematical Society, 1950 253 p. 26 cm. (American Mathematical Society Mathematical surveys. No iv) $6.00 472

Contents: General properties of valuations. Complete fields. The ramification theory of valuations. Special ideal theory. Arithmetic of simple algebras. Local class field theory. The structure of complete fields. The general Galois theory. Facts about linear algebras. Glossary.

Note: The theory of valuations is a branch of topological algebra. Valuation theory plays an important part in such fields of algebra as class field theory, the structure of commutative rings, and the foundations of algebraic geometry. This volume concentrates on the general significance of valuation theory for the algebraic and arithmetic structure of fields, division rings, and simple algebras. Each chapter has its own bibliography and a major part of the literature on valuations is covered.

Steenrod, Norman

The topology of fibre bundles. Princeton Princeton University Press, 1951 224 p. illus. 24 cm. (Princeton mathematical series editors, Marston Morse and A. W. Tucker No. 14) $5.00 473

Contents (abridged): Part i, The general theory of bundles. Coordinate bundles and fibre bundles. The product bundle. The Ehresmann-Feldbau definition of bundle. Factor spaces of groups. Associated bundles and relative bundles. Homotopies of maps of bundles. Covering spaces. Part ii, The homotopy theory of bundles. Homotopy groups. Universal bundles and the classification theorem. The fibering of spheres by spheres. The homotopy groups of spheres. The homotopy groups of miscellaneous manifolds. On the nonexistence of fiberings of spheres by spheres. Part iii, The cohomology theory of bundles. Bundles of coefficients. The obstruction cocycle. The primary difference of two cross-sections. The Whitney characteristic classes of a sphere bundle. Complex analytic manifolds and exterior forms of degree 2. Bibliography. Index.

Note: The concept of fibre bundles as a phase of algebraic topology was first enunciated in 1935. This treatise provides a systematic account of the development of the subject from then to the time of writing. It offers little that is new to mathematicians acquainted with the subject, but rather presents in organized form the theory as it then stood. The author is Professor of Mathematics at Princeton University.

WADE, THOMAS L

The algebra of vectors and matrices Reading, Mass Addison Wesley Publishing Company, Inc, 1951 189 p 22 cm. $5 50 474

Content Basic concepts. Vectors of two and three dimensions. Vector methods in geometry linear dependence of vectors. Vectors of n dimensions. Elementary properties of matrices. Related and special matrices. Groups, matrices, and transformations. The characteristic equation of a matrix. Rank of a matrix. Matrices and algebraic forms. Some applications of matrix algebra. Appendixes. Bibliography Index. Answers to exercises.

Note An introduction for students who desire only a working knowledge and will not pursue the subject any further than this book. On the other hand, the treatment is developed against the background of modern algebra hence, it can be used as an introduction to the whole field of modern algebra.

WEDDERBURN, JOSEPH HENRY MACLAGAN

Lectures on matrices New York American Mathematical Society, 1934 200 p illus. 26 cm (American Mathematical Society Colloquium publications Vol XVII) $3.35 475

Contents Matrices and vectors. Algebraic operations with matrices. The characteristic equation. Invariant factors and elementary divisors. Vector polynomials. Singular matric polynomials. Compound matrices. Symmetric, skew and Hermitian matrices. Commutative matrices. Functions of matrices. The automorphic transformation of a bilinear form. Linear associative algebras. Appendixes. Bibliography Index.

Note The fundamental nature of matric theory extends its roots under algebra, number theory geometry differential and integral equations, wave mechanics—a fairly representative cross-section of modern mathematics. In this volume, which is an outgrowth of the author's lectures given at Princeton since 1920, the entire subject has been completely reworked and the proofs recast.

WHYBURN, GORDON THOMAS

Analytic topology New York The American Mathematical Society 1942 278 p 26 cm (American Mathematical Society Colloquium publications Vol XXVIII) $4 75 476

Content I troductory topology Continuous transformations. Junction properties of locally connected sets. Cut points. Non-separated cuttings. Cyclic element theory Special types of continua. Plane continua. Semi-continuous decompositions and continuous transformations. General properties. Factorization. Applications of monotone and non-alternating transformations. Interior transformations. Existence theorems. Mappings onto the circle. Periodicity Fixed points. Bibliography Index.

Note This book has as its principal object the development of various phases of topology by methods in which continuous transformations play the essential role. Results on monotone, non-alternating, interior and periodic mappings are particularly stressed. Set-theoretic topology is built up from system of axioms, and the structure f locally connected and semi-locally connected continua is thoroughly studied in order to prepare the nontopological reader for the applications of transformations to these spaces which are given in the later sections of the book A large part of the material included represents recent developments in the field and new results obtained by the author are presented.

WILDER, RAYMOND LOUIS

Topology of manifolds New York American Mathematical Society 1949 395 p. 26 cm (American Mathematical Society Colloquium publications Vol. XXXII) $7 00 477

Contents Elementary concepts characterizations of E^2 and S^2 Locally connected spaces fundamental properties of the Euclidean sphere. Peano spaces characterizations of S^2 and the 2-manifolds. Non-metric LC spaces, with applications to subsets of the 2-sphere. Basic algebraic topology Local connectedness and local co-connectedness. Application of homology and cohomology theory to the theory of continua. Generalized manifolds dualities of the Poincaré and Alexander type. Further properties of n-GMS regular manifolds and generalized n-cells. Submanifolds of a manifold decomposition into cells. Lc^n subsets of an n-GM. Accessibility and its applications. Appendix Bibliography Index.

Note This is self-contained book which can serve as an introduction to topology Properties of general topological spaces, compact spaces and continua, homology and cohomology theory of general spaces are developed, with applications to Euclidean spaces, local connectedness and continua. Manifolds are characterized axiomatically among the general topological spaces, the classical manifolds forming special cases of the generalized types. Basic duality theorems of the Poincaré and Alexander-Pontrjagin type are established, and both the local and in-the-large properties of manifolds studied.

YOUNG, L C

On generalized surfaces of finite topological types Providence American Mathematical Society, 1955 63 p 26 cm (American Mathematical Society Memoirs. No 17) $1.30 478

Note A contribution to the theory of surfaces, to which theory the author has contributed other important studies. Concerning the scope of the present study the author has stated, "W are concerned with generalization of the notion of the surface in the *parametric form.* If one thinks of such a surface as somehow represented by function $x(u,)$ whose values lie in Euclidean m-space X while $(u,)$ ranges in the unit square $R(0 < \ < 1, 0 < \ < 1)$ the question arises as to when two such $x(u\ v)$ are to be regarded as defining a same surface. T this question conflicting answers have been given and every such answer gives rise to differ ent notion of parametric surface thus, a polyhedron, as defined in combinatory topology has representations $x(u, v)$ which are not equivalent in the sense of (say) *Fréchet.* The key to the present theory lies precisely in new specification of the equivalence of two $x(u,)$ specification which is closest to that of combinatory topology"

GEOMETRY

AHLFORS, LARS V, AND OTHERS, editors

Contributions to the theory of Riemann surfaces Centennial celebration of Riemann s dissertation. Edited by L Ahlfors, E Calabi, M Morse, L Sario D Spencer Princeton Princeton University Press, 1953 264 p illus 25 cm (Annals of mathematics studies edited by Emil Artin and Marston Morse No 30) 479

Contents Developments of the theory of conformal mapping and Riemann surfaces through a century by L. V Ahlfors. Variational methods in the theory of Riemann surfaces, by M. Schiffer Semigroups of transformations of Riemann surface into itself by P C. Rosenbloom. An extremal boundary problem, by A. C. Schaeffer On Dirichlet principle, by M. Schiffman. A problem concerning the continuation f Riemann surfaces, by M. Heins. Construction f functions with prescribed properties on Riemann surfaces, by L. Sario. Metric Riemann surfaces, by E. Calabi. Some results related to extremal length, by J A. Jenkins. Random walk and the type problem of Riemann surfaces, by S. Kakutani. Construction of parabolic Riemann surfaces by the general reflection principle, by W Kaplan. On the ideal boundary of a Riemann surface, by H. L. Royden. Topological methods on Riemann surfaces pseudoharmonic functions, by M. Morse and J A. Jenkins. Coverings of Riemann surfaces, by L. Fourès. Partial differential equations and pseudo-analytic functions on Riemann surfaces, by L. Bers. Dirichlet's principle and some inequalities in the theory of conformal mapping, by Z. Nehari. On the effective determination of conformal maps, by S. E. Warschawski. Structure f complex spaces, by S Bochner Real and complex operators on manifolds, by D C. Spencer Multivalued solutions of linear partial differential equations, by S. Bergman The theorem of Riemann-Roch for adjoint systems on Kählerian varieties, by K. Kodaira.

Note The volume contains the 21 papers presented at the Conference on Riemann Surfaces held December 14 15 1951 in Princeton, N J in commemoration of the centennial of the presentation by Bernhard Riemann of his inaugural dissertation. Authors and titles are given above. The authors, all eminent mathematicians, have addressed other graduate mathematicians. Bibliographical references are printed with each paper

Albert, Abraham Adrian
Solid analytic geometry. New York, McGraw Hill Book Company, Inc., 1949. 162 p. illus. 24 cm. $4.00 480

Contents: Coordinates and lines. Planes. Surfaces and curves. Spheres. Quadric surfaces. Theory of matrices. Rotations of axes and applications. Spherical coordinates. Elements of projective geometry. Index.

Note: A textbook in which the author has used the algebraic vector approach to the subject in order to tie it up with the theory of vectors and matrices. The book is designed for one-semester college courses. The author is Professor of Mathematics in the University of Chicago.

Brink, Raymond Woodward
Spherical trigonometry. New York, D. Appleton-Century Co., Inc., 1942. 62 p. illus. 21 cm. $1.25 481

Contents (abridged): The geometry of the sphere. The right spherical triangle. The oblique spherical triangle. The celestial sphere. Appendices. The sail. The heavens. Latitudes and longitudes. Index.

Note: This textbook on the fundamentals of spherical trigonometry is suited to college students. Answers to problems are included, making the book adaptable to home-study.

Busemann, Herbert
The geometry of geodesics. New York, Academic Press Inc., 1955. 422 p. illus. 24 cm. (Pure and applied mathematics, a series of monographs and textbooks, edited by Paul A. Smith and Samuel Eilenberg) $9.00 482

Contents: The basic concepts. Desarguesian spaces. Perpendiculars and parallels. Covering spaces. The influence of the sign of the curvature on the geodesics. Homogeneous spaces. Appendix: Problems and Comments. Notes to the text. Index.

Note: An important contribution to differential geometry. According to the author it [illegible] extends the method developed in the author's "Metric methods in Finsler spaces and in the foundations of geometry" (Princeton, 1942). In the earlier book the emphasis was on spaces in which the geodesic through two points is unique, whereas it is now on the general case in which the geodesics have only local uniqueness properties. Consequently the relations to the foundations of geometry are no longer very relevant and Finsler spaces are the principal subject.

Busemann, Herbert and Paul J. Kelly
Projective geometry and projective metrics. New York, Academic Press Inc., 1953. 332 p. illus. 24 cm. (Pure and applied mathematics, a series of monographs and textbooks, edited by Paul A. Smith and Samuel Eilenberg) $7.00. 483

Contents: The projective plane. Polarities and conic sections. Affine geometry. Projective metrics. Non-Euclidean geometry. Spatial geometry. Bibliography. Index.

Note: A college text in which selected topics in projective geometry are presented from the modern viewpoint. The reader needs a basic knowledge of the theory of equations and of matrix algebra.

Cell, John Wesley
Analytic geometry. Second edition. New York, John Wiley & Sons, Inc., 1951. 326 p. illus. 22 cm. $4.00 484

Contents: Elementary concepts of plane analytic geometry. The loci derivation and the straight line. Introduction to curve sketching. Conics. Transcendental curves. Polar coordinates. Parametric equations. Empirical equations. Planes and lines in solid analytic geometry. Surfaces in solid analytic geometry. General review. Appendix. Answers. Index.

Note: Throughout this college text for first courses in analytic geometry emphasis is placed on methods of constructing graphs from equations and on deriving equations from graphs. The treatment is particularly adapted to students majoring in the engineering and physical sciences, and each chapter includes numerous examples and problems having application in these fields.

Cesari, Lamberto
Surface area. Princeton, Princeton University Press, 1956. 595 p. 26 cm. (Annals of mathematics studies, edited by Emil Artin and Marston Morse) $8.50 485

Contents: Introductory considerations. Lebesgue area. The Geöcze areas V and U and the Peano area P. BV and AC plane mappings. The first theorem. The Cavalieri inequality. Identification of Lebesgue, Geöcze, Peano areas. Geometrical properties and the second theorem. The representation problem. The representation of general surfaces and the third theorem. Appendices: A direct proof of [illegible] property of continuous surfaces. Weierstrass integral over surfaces. Bibliography. Special [illegible] and abbreviations.

Note: A formal mathematical study of [illegible] the concepts connected with parametric surfaces and area and of the related main theorems with complete proof.

Courant, Richard
Dirichlet's principle, conformal mapping and minimal surfaces. With an appendix by M. Schiffer. New York, Interscience Publishers Inc., 1950. 330 p. illus. 23 cm. (Pure and applied mathematics, a series of texts and monographs, edited by H. Bohr, R. Courant and J. J. Stoker) $7.50 486

Contents: Dirichlet's principle and the boundary value problem of potential theory. Conformal mapping on parallel-slit domains. Plateau's problem. The general problem of Douglas. Conformal mapping of multiply connected domains. Minimal surfaces with free boundaries and unstable minimal surfaces. Bibliography. Appendix: Some recent developments in the theory of conformal mapping. Green's function and boundary value problems. Dirichlet integrals for harmonic functions. Variation of the Green's function. Bibliography to appendix. Index.

Note: Dirichlet's principle is of wide interest in analysis and higher geometry. In this book the author not only presents the principle and its proofs but illustrates the application of the concept to various problems in mathematics, especially problems of minimal surfaces. Though no applications to technology are indicated in the book, nevertheless the book's contents are applicable to such practical problems as the analysis of mapping of electromagnetic fields.

Davis, David Roy
Modern college geometry. Reading, Mass., Addison Wesley Publishing Company, Inc., 1949. 238 p. illus. 22 cm. $5.50 487

Contents: The fundamental framework of plane geometry. Loci of plane geometry. Fundamental theorems. Euclidean geometric figures. Auxiliary figures of the triangle. The harmonic range. Noteworthy lines and points. Systems of circles. Inversion. Constructions in Euclidean geometry. Bibliography. Index.

Note: An introductory textbook in modern (that is, post-Euclidean) geometry. The author, who is Professor of Mathematics at the State Teachers College, Montclair, N. J., had in mind as he prepared the book the needs of students preparing to teach secondary-school mathematics. However it is suitable generally as a first book in the subject and can even be used for self-instruction. Theorems are stated and rigorously proved except in the first and last chapters. In the last chapter the famous unsolved problems of the early Greek geometers, namely the trisection of the angle, the inscribing of a regular n-gon (polygon having n sides) in a circle, the construction of a cube having twice the volume of a given cube, and the squaring of the circle, are elucidated against the work of later mathematicians.

Donnay, Joseph Desire Hubert
Spherical trigonometry after the Cesàro method. New York, Interscience Publishers, Inc., 1945. 83 p. illus. 19 cm. $2.50. 488

WADE, THOMAS L.
The algebra of vectors and matrices Reading, Mass. Addison Wesley Publishing Company, Inc., 1951 189 p 22 cm $5 50 474

Contents Basic concepts. Vectors of two and three dimensions. Vector methods in geometry linear dependence of vectors. Vectors of n dimensions. Elementary properties of matrices. Related and special matrices. Groups, matrices, and transformations. The characteristic equation of a matrix. Rank of a matrix. Matrices and algebraic forms. Some applications of matrix algebra. Appendices. Bibliography Index. Answers to exercises.

Note An introduction for students who desire only a working knowledge and will not pursue the subject any further than this book. On the other hand, the treatment is developed against the background of modern algebra hence, it can be used as an introduction to the whole field of modern algebra.

WEDDERBURN, JOSEPH HENRY MACLAGAN
Lectures on matrices New York American Mathematical Society, 1934 200 p illus. 26 cm (American Mathematical Society Colloquium publications Vol XVII) $3.35 475

Contents Matrices and vectors. Algebraic operations with matrices. The characteristic equation. Invariant factors and elementary divisors. Vector polynomials. Singular matric polynomials. Compound matrices. Symmetric, skew and Hermitian matrices. Commutative matrices. Functions of matrices. The automorphic transformation of a bilinear form. Linear associative algebras. Appendices. Bibliography Index.

Note. The fundamental nature of matric theory extends its roots under algebra, number theory geometry differential and integral equations, wave mechanics—a fairly representative cross-section of modern mathematics. In this volume which is an outgrowth of the author's lectures given at Princeton since 1920, the entire subject has been completely reworked and the proofs recast.

WHYBURN, GORDON THOMAS
Analytic topology New York The American Mathematical Society 1942 278 p 26 cm (American Mathematical Society Colloquium publications Vol XXVIII) $4 75 476

Contents Introductory topology Continuous transformations. Junction properties of locally connected sets. Cut points. Non-separated cuttings. Cyclic element theory Special types of continua. Plane continua. Semi-continuous decompositions and continuous transformations. General properties. Factorization. Applications of monotone and non-alternating transformations. Interior transformations. Existence theorems. Mappings onto the circle. Periodicity Fixed points. Bibliography Index.

Note This book has as its principal object the development of various phases of topology by methods in which continuous transformations play the essential role Results on monotone, non-alternating, interior and periodic mappings are particularly stressed. Set-theoretic topology is built up from a system of axioms, and the structure of locally connected and semi-locally connected continua is thoroughly studied in order to prepare the nontopological reader for the applications of transformations to these spaces which are given in the later sections of the book. A large part of the material included represents recent developments in the field and new results obtained by the author are presented.

WILDER, RAYMOND LOUIS
Topology of manifolds New York American Mathematical Society 1949 395 p 26 cm (American Mathematical Society Colloquium publications Vol XXXII) $7 00 477

Contents Elementary concepts characterizations of E^2 and S^2 Locally connected spaces fundamental properties of the Euclidean n-sphere. Peano spaces characterizations of S^2 and the 1-manifolds. Non-metric LC spaces, with applications to subsets of the 2-sphere. Basic algebraic topology Local connectedness and local co-connectedness. Application of homology and cohomology theory to the theory of continua. Generalized manifolds dualities of the Poincaré and Alexander type Further properties of n-GMS, regular manifolds and generalized n-cells. Submanifolds of a manifold decomposition into cells. Lc^n subsets of an n-GM. Accessibility and its applications. Appendix. Bibliography Index.

Note This is a self-contained book which can serve as an introduction to topology Properties of general topological spaces, compact spaces and continua, homology and cohomology theory of general spaces are developed, with applications to Euclidean spaces, local connectedness and continua. Manifolds are characterized axiomatically among the general topological spaces, the classical manifolds forming special cases of the generalized types. Basic duality theorems of the Poincaré and Alexander-Pontrjagin type are established, and both the local and in-the-large properties of manifolds studied.

YOUNG, L C
On generalized surfaces of finite topological types *Providence* American Mathematical Society, 1955 63 p 26 cm (American Mathematical Society Memoirs No 17) $1.30 478

Note A contribution to the theory of surfaces, to which theory the author has contributed other important studies. Concerning the scope of the present study the author has stated, "We are concerned with a generalization of the notion of the surface in the *parametric* form. If one thinks of such a surface as somehow represented by a function x( ) whose values lie in Euclidean m-space X while (u,) ranges in the unit square R(0 < < 1, 0 < v < 1) the question arises as to when *two* such x(u, v) are to be regarded as defining same surface. T this question, conflicting answers have been given and every such answer gives rise to a different notion of parametric surface thus, a polyhedron, as defined in combinatory topology has representations x(v) which are not equivalent in the sense of (say) Fréchet. The key to the present theory lies precisely in a new specification of the equivalence of two x(u,) a specification which is closest to that of combinatory topology

Spencer Multivalued solutions of linear partial differential equations, by S. Bergman The theorem of Riemann-Roch for adjoint systems on Kählerian varieties, by K. Kodaira.

Note. The volume contains the 21 papers presented at the Conference on Riemann Surfaces held December 14, 15, 1951 in Princeton, N J., in commemoration of the centennial of the presentation by Bernhard Riemann of his inaugural dissertation. Authors and titles are given above. The authors, all eminent mathematicians, have addressed other graduate mathematicians. Bibliographical references are printed with each paper

MANNING HENRY PARKER

Geometry of four dimensions. New York Dover Publications, Inc., 1955 348 p. illus. 21 cm. $1 95 496

Contents (abridged) The foundations of four-dimensional geometry Perpendicularity and simple angles. Angles of two planes and angles of higher order. Symmetry order, and motion. Hyperpyramids, hypercones, and the hyper sphere. Euclidean geometry, figures with parallel elements. Measurement of volume and hypervolume in hyperspace. The regular polyhedroids. Technical terms. Index.

Note. A reprint without change in the text of book that was first published in 1914. It is an elementary introduction to the geometry of hyperspace of four dimensions and is still useful as first book to study on the geometry of hyperspaces of dimensions.

MESERVE, BRUCE E

Fundamental concepts of geometry Reading, Mass. Addison-Wesley Publishing Company, Inc., 1955 321 p. illus. 22 cm. (Addison-Wesley mathematics series Eric Reissner consulting editor) $7.50 497

Contents: Foundations of geometry Synthetic projective geometry Coordinate systems. Analytic projective geometry Affine geometry Euclidean plane geometry The evolution of geometry Non-Euclidean geometry Topology Bibliography Index.

Note: This book can well be described as an introduction to the structure and rules of mathematics as exemplified in geometry Primarily it deals with euclidean geometry as system built up according to the rules of logic upon elements and postulates. The relations of euclidean geometry to other geometries are also made clear The book was developed for students who have completed standard introductory courses in college mathematics and, because they have planned to teach mathematics or for some other reason, are in need of basic understanding of mathematics as an area of human thought. It should have also considerable appeal for sophisticated lay readers interested in mathematics

SCHIFFER, MENAHEM AND DONALD C SPENCER

Functionals of finite Riemann surfaces. Princeton Princeton University Press 1954 451 p. illus. 24 cm. (Princeton mathematical series editors Marston Morse and A. P Tucker) $8.00. 498

Contents. Geometrical and physical considerations Existence theorems for finite Riemann surfaces Relations between differentials. Linear differentials Surfaces imbedded in given surface. Integral operators Variations of surfaces and of their functionals Applications of the variational method. Remarks on generalization to higher dimensional Kähler manifolds. Index.

Note "The main purpose of [this] monograph is the investigation of finite Riemann surfaces from the point of view of functional analysis, that is, the study of the various Abelian differentials of the surface in their dependence on the surface itself. Riemann surfaces with boundary are closed by the doubling process and their theory is then reduced to that of closed surfaces. Attention is centered on the differentials of the third kind in terms of which the other differentials may be expressed. The relations between the functionals of two Riemann surfaces one of which is imbedded in the other are studied, and series developments are given for the functionals of the smaller surface in terms of those of the larger. In final chapter some aspects of the generalization of the theory to Kähler manifolds of higher dimension are discussed.

SIGLEY DANIEL T AND WILLIAM T STRATTON

Solid geometry Revised edition. New York The Dryden Press Inc. 1956 197 p illus. 21 cm. $2.60 499

Contents. Review of plane geometry. Planes in space Loci. Angles. Polyhedrons and prisms. Pyramids. Cylinders and cones. Cavalieri's theorem and prismoids. Spheres. Spherical geometry Symmetry and solids of revolution. Miscellaneous exercises. Appendix. Answers to exercises. Index.

Note: A textbook designed for use in colleges rather than in secondary schools. Plane geometry is reviewed in the first chapter. The chapters that follow are devoted to the concepts and techniques of solid geometry and they emphasize practical applications to problems in mensuration. The emphasis is particularly marked in the exercises. The book is well organized and adequately illustrated. The first edition was published in 1941. The chapter "Symmetry and solids of revolution" is new in this revised edition, and new and better illustrations are used throughout. The exercises included for students to solve have been revised, and answers for all of them are now provided.

STRUIK, DIRK JAN

Lectures on classical differential geometry Reading Mass. Addison Wesley Publishing Company Inc., 1950 221 p. illus. 23 cm. (Addison Wesley mathematics series Eric Reissner consulting editor) $7.50 500

Contents: Preface. Bibliography Curves. Elementary theory of surfaces. The fundamental equations. Geometry on surface. Some special subjects. Some problems and propositions. Answers to problems. Index.

Note: A college textbook based on material used by the author in one-semester course offered to advanced undergraduate students and graduate students at the Massachusetts Institute of Technology Lucid discussions are supplemented by exceptionally good illustrations and liberal sprinkling of biographical and bibliographical notes.

TAYLOR, EDSON HOMER, AND GROVER CLEVELAND BARTOO

An introduction to college geometry New York The Macmillan Company, 1949 143 p illus. 21 cm. $3 75 501

Contents: Directed lines and angles. Points at infinity Similar figures. Loci. Properties of the triangle. Harmonic ranges and pencils. Inversion. Pole and polar. Orthogonal circles. Radical axis—coaxal circles. Cross ratio. Principle of duality Appendix. Index.

Note: Consisting of exercises and 90 theorems in plane geometry most of which are not usually presented in high-school courses, this book provides an introduction to advanced study for students [illegible] majoring in mathematics. The first edition was published in 1939. In this revision the historical notes have been expanded, new material has been added, and minor changes have been made in the proofs of theorems for purposes of clarity

TURRELL FRANKLIN MARION

Tables of surfaces and volumes of spheres and of prolate and oblate spheroids and spheroidal coefficients. Berkeley and Los Angeles University of California Press 1946 153 p illus. 22 cm. $2.00 502

Contents: Preface. Introduction: Definitions. Symbols used in tables. Surfaces and volumes of spheres. Surfaces and volumes of spheroids. Surface coefficients for prolate spheroids. Surface coefficients for oblate spheroids. Volume coefficients for prolate spheroids. Volume coefficients for oblate spheroids. Appendices: Derivations of formulas. Curves of and coefficients. Approximate per cent errors for tables 3, 4, 5, and 6. Index.

Note: The original tables in this book were designed particularly for use in calculating the surfaces and volumes of citrus fruits, but they can be applied also to other fruits, to melons and nuts, and to other geometrically regular bodies approximating these shapes. The tables are constructed so as to facilitate very rapid approximations of the areas and volumes [illegible] the necessity for using interpolation and with very small consequent error

UNITED STATES NATIONAL BUREAU OF STANDARDS

Experiments in the computation of conformal maps. Edited by John Todd. Washington, D C. Government Printing Office 1955

Contents Introduction. The stereographic projection. Cesàro's key-triangles. How the key-triangles are put to work. Relations between four parts of a spherical triangle. Right-angled triangles. Examples of calculations. Problems. Exercises. Appendices: Spherical areas. Formulae of plane trigonometry Index.

Note A brief text designed to provide a practical knowledge of spherical triangles for use in such sciences as geodesy astronomy crystallography and navigation. The book employs a time-saving method of deriving formulas by means of key-triangles, developed by Giuseppe Cesàro (1849–1939) professor at the University of Liège. It includes a selection of problems completely worked out, and a number of exercises, with answers. The treatment is based on the author's experience in teaching the subject at Johns Hopkins University and Laval University

EISENHART, LUTHER PFAHLER

An introduction to differential geometry, with use of the tensor calculus. Princeton Princeton University Press, 1940 304 p illus. 23 cm. (Princeton mathematical series 3) $6 00 489

Contents Curves in space. Transformation of coordinates. Tensor calculus. Intrinsic geometry of a surface. Surfaces in space. Bibliography Index.

Note. In this book for advanced students of mathematics, the tensor calculus of Euclidean 3-space is developed and then generalized so as to apply to a Riemannian space of any number of dimensions. The tensor calculus as here developed is applied to the study of differential geometry f surfaces in 3-space. With knowledge of the methods used in this book and the subjects treated, student will be prepared for work in the theory of relativity and for the study of Riemannian geometry and its generalizations.

EISENHART, LUTHER PFAHLER

Riemannian geometry Princeton Princeton University Press, 1949 306 p 24 cm. $5 00 490

Contents. Tensor analysis. Introduction of a metric. Orthogonal examples. The geometry of sub-spaces. Sub-spaces of a flat space. Groups of motions. Appendices: Bibliography Additional bibliography Index.

Note. A notable presentation of the modern theory f Riemannian geometry It was first published in 1926. In this edition (called second printing by the publisher) errors in the previous edition have been corrected, and developments down to 1949 are presented in the appendices which occupy 37 pages. The "additional bibliography" lists mainly publications of 1926–1949

GRAUSTEIN, WILLIAM CASPAR

Introduction to higher geometry New York The Macmillan Company, 1930 486 p illus. 22 cm (A series of mathematical texts edited by E R Hedrick) $6 50 491

Contents (abridged) Linear equations and linear dependence. Geometrical introduction. Homogeneous Cartesian coordinates. Linear dependence of points and lines. Harmonic divisions. Line coordinates. Cross ratio. Transformations. Metric geometry of the complex plane. One-dimensional projective geometry Projective coordinates in the plane. Geometries. Point conics and line conics. Point curves and line curves. Projective affine and metric properties f conics. Projective theory of conics. Pairs and pencils of conics. Applications of transformations. The circle. Space geometry Supplementary reading. Index.

Note. This is textbook designed to initiate the student in the basic ideas and methods, and to furnish an adequate background for further geometrical studies. A few fields only are developed thoroughly with special emphasis laid on fundamentals common to all geometry The geometries associated with the projective group and the group of circular transformations, of the groups of geometrical transformations, are selected for intensive study The systematic method f exposition, rather than the problem method, is used.

GRAUSTEIN, WILLIAM CASPAR

Differential geometry New York The Macmillan Company, 1935 230 p illus 22 cm. $5.50 492

Contents Introduction. Space curves. Curves and surfaces associated with a space curve. Fundamentals of the theory of surfaces. Curvature Important systems of curves. The fundamental theorem. Geodesic curvature. Geodesics. Mapping of surfaces. Absolute geometry of surface. Surface of special type. Index.

Note: An account of the fundamentals of metric differential geometry of curves and surfaces in a euclidean space of three dimensions, expressed in terms of vector notation. Intended for advanced students with a working knowledge of solid analytic geometry and the calculus who are specializing in mathematics or physics. Differential equations are used rather frequently in explaining theory The fundamental properties of curves and surfaces are discussed, together with the mapping of surfaces, the absolute geometry on surface, and an introduction to Riemannian geometry and its generalizations.

KERN, WILLIS FREDERICK, AND JAMES R. BLAND

Solid mensuration, with proofs. Second edition New York John Wiley & Sons, Inc., 1938 172 p illus $3.25 493

Contents Plane figures. Lines—planes—angles. Solids for which $V = Bh$. Solids for which $V = 1/3\ Bh$. Solids for which $V = (\text{mean } B)h$ The sphere. Volumes and surfaces of revolution—polyhedrons. The general prismatoid. Summary and review Appendix. Tables. Answers. Index.

Note An analysis of the fundamental, practical essentials of solid geometry In this revision, simple proofs of the volume and surface formulas are given. By basing the proof of each volume formula on Cavalieri's theorem, the conventional treatment is greatly simplified. Further simplification is obtained by considering the elementary and most familiar solids first and by separating the solids into natural groups.

LANE, ERNEST PRESTON

Metric differential geometry of curves and surfaces. Chicago The University of Chicago Press, *1940 216 p illus. 23 cm. $4 00* 494

Contents (abridged) Curves. The moving trihedron. Surfaces. Curves on surfaces. Curvature. Transformation of surfaces.

Note An exposition of the fundamentals of the metric differential geometry of curves and surfaces in ordinary three-dimensional space. The treatment is elementary since the book is designed for beginners in the subject. Vectors are not used. The definitions of those configurations hich admit of projective definitions are stated in projective form and, whenever possible, definitions are stated in such a way as to be valid in hyperspace as well as in ordinary space. This manner of approach smooths the way for those readers who go on to study projective and hyperspacial geometries.

LEFSCHETZ, SOLOMON

Algebraic geometry Princeton Princeton University Press, 1953 233 p 24 cm. (Princeton mathematical series editors Marston Morse and A W Tucker No 18) $5.00 495

Contents. Algebraic foundations. Algebraic varieties—fundamental concepts. Transformations of algebraic varieties. Formal power series. Algebraic curves, their places and transformations. Linear series. Abelian differentials. Abel's theorem algebraic series and correspondences. Systems f curves on surface. Appendix. Bibliography Index.

Note This survey of modern algebraic geometry reflects the major revolutions in this field which have resulted in the application of rigorous algebraic methods in place of the older intuitive methods. The first three chapters are devoted to fundamental concepts and techniques. In the fourth chapter formal power series are introduced, and are used in later chapters to translate essential parts of the classical theory of functions of a complex variable into local algebraic theory In most of the chapters in the latter part of the book, "the ground field is prudently taken to be algebraically closed and especially of characteristic zero." The fifth and sixth chapters, on algebraic curves, conclude with proof of the theorem of Riemann-Roch.

introduction to the subject and is written for professional engineers, scientists, business men, and students. Emphasis is placed on actual constructional problems, and several full-scale charts illustrating their application in science and business are included.

HEACOCK, FRANK A.

Graphic methods for solving problems Princeton Princeton University Store 1952 113 p. 28 cm. $1 90 510

Contents: Simple graphs and charts. The hydrograph. Geometric diagrams. Network charts. Vectors and mechanics. Descriptive geometry. Nomographs and computing devices. Graphic analysis. General bibliography. Index.

Note: Primarily this book is an annotated, bibliographical guide to the articles and books on graphic methods that have been published from 1837 through 1950. However each of the chapters begins with section in which particular type of graphic device or method is carefully defined and illustrated. The main emphasis is on engineering uses of graphic methods, but some material is included on pictorial charts and other devices that are used in number of fields. The book is development of research undertaken for committee of the American Society for Engineering Education.

HILDEBRAND F B

Introduction to numerical analysis. New York McGraw Hill Book Company Inc., 1956 511 p 24 cm (International series in pure and applied mathematics William Ted Martin, consulting editor) $8.50 511

Contents: Introduction. Interpolation with divided differences. Lagrangian methods. Finite-difference interpolation. Operations with finite differences. Numerical solution of differential equations. Least-squares polynomial approximation. Gaussian quadrature and related topics. Approximations of various types. Numerical solution of equations. Appendixes: Justification of the Crout reduction. Bibliography. Directory of methods. Index.

Note: A textbook developed at the Massachusetts Institute of Technology where the author is Associate Professor of Mathematics. A major aim of the work is to prepare the reader to use computers, both desk calculators and electronic machines; however the emphasis is on basic concepts and techniques, such as approximation, interpolation, numerical solution of equations, smoothing of data, and the numerical summation of series. Programming for electronic computers is not covered. Included are wide range of problems, many of which are designed for computation on desk calculators.

HOELSCHER, RANDOLPH PHILIP AND OTHERS

Graphic aids in engineering computation by Randolph P Hoelscher Joseph Norman Arnold, and Stanley H. Pierce. New York McGraw Hill Book Company Inc. 1952 197 p. illus. 24 cm. $4.50 512

Contents: Standard slide rules. Empirical equations from engineering data. Alignment charts. Graphical calculus. Alignment charts with determinants. Special slide rules. Movable-scale nomographs. Index.

Note: An introduction for engineering college students. The construction of alignment charts is covered with exceptional thoroughness. Slide rules are discussed more briefly but the most essential information is given and the discussion of special slide rules is related to that of alignment charts. The first-named author is head of the Department of Engineering Drawing of the University of Illinois.

HOUSEHOLDER, ALSTON S

Principles of numerical analysis. New York McGraw Hill Book Company Inc., 1953 274 p. 24 cm. (International series in pure and applied mathematics William Ted Martin, consulting editor) $6.00 513

Contents: The art of computation. Matrices and linear equations. Nonlinear equations and systems. The proper values and vectors of a matrix. Interpolation. More general methods of approximation. Numerical integration and differentiation. The Monte Carlo method. Bibliography. Problems. Index.

Note: Although this book is addressed to graduate students and graduate mathematicians who are concerned with devising methods for modern calculating machines, particularly electronic computers, background knowledge rather than computational techniques, is the primary subject. A considerable part of the space is devoted to methods of inversion and decomposition of matrices. The account of the Monte Carlo method is very short one, which is, however supplemented by reference to the literature published through 1952. The author is Senior Mathematician on the staff of the Oak Ridge National Laboratory

JOHNSON, LEE H

Nomography and empirical equations. New York John Wiley & Sons Inc., 1952 152 p. illus. 23 cm. $4.00 514

Contents. Part I, Nomography: Introduction. Parallel scale nomographs. Z-charts. Parallel and perpendicular index lines. Concurrent scales. Recurrent variables. Combined nomographs. Part II, Empirical equations: Methods of curve fitting. Curves with two constants. Curves with three constants. Curves with four constants. Index.

Note. A useful book directed to physicists, engineers, and others who wish to make use of graphic methods in computation. It is well arranged, and its explanations are written out fully in lucid style. Numerous examples of nomograph construction and of curve fitting are included. Readers need only mathematical knowledge covering logarithms, plane geometry and analytical geometry

KOPAL, ZDENEK

Numerical analysis with emphasis on the application of numerical techniques to problems of infinitesimal calculus in single variable. New York John Wiley & Sons, Inc., 1955 556 p. illus. 23 cm $12 00 515

Contents. Introduction. Polynomial interpolation. Numerical differentiation. Integration of ordinary differential equations. Boundary value problems—algebraic methods—variational, iterative, and other methods. Mechanical quadratures. Numerical solution of integral and integro-differential equations. Appendices. Name index. Subject index.

Note. Several factors, not the least of which is the availability of electronic computers, have combined to make an understanding of the techniques of numerical analysis essential to present-day physicists and engineers. This book, which is at the same time thorough and practical, is help to physicists and engineers in acquiring this knowledge. In the introductory chapter the author states, the essence of numerical analysis [is] namely to use the methods of the infinitesimal calculus when they represent short cut, but to avoid them by recourse to algebra when they become unmanageable. The chapter titles quoted above indicate the arrangement and scope of the work. The appendices contain variety of auxiliary material that complements the main body of the work and in some instances is more difficult mathematically. The matter in the book was first delivered as lectures at the Massachusetts Institute of Technology and elsewhere.

KRAITCHIK, MAURICE

Alignment charts—construction and use. Princeton D Van Nostrand Company Inc., 1944 94 p. illus. 23 cm. $3.00. 516

Contents: The reader' preliminary introduction. Graduation of scales. Conversion scales. Alignment charts. Equidistant parallel scales. Parallel scales not equidistant. Two parallel scales. Functions of more than three variables. The choice among different representations. Special charts. The reader's prospect. Index.

Note: An introductory book on the construction of nomographic charts. The book is intended mainly for scientists, engineers, and others who have practical use for such charts in the solving of equations.

LEVENS ALEXANDER SANDER

Nomography New York John Wiley & Sons Inc., 1948 176 p. illus. 23 cm. $3.00 517

61 p 26 cm. (National Bureau of Standards Applied mathematics series No 42) $0 40 503

Contents Conformal mapping of a special ellipse, on the unit circle, by A. M. Ostrowski. Theodorsen's and Garrick method for conformal mapping of the unit circle into an ellipse, by A. M. Ostrowski. On the solution of the Lichtenstein-Gershgorin integral equation in conformal mapping: I, Theory by S. E. Warschawski—II, Computational experiments, by J Todd and S. E. Warschawski. Two numerical methods in conformal mapping, by L. Ahlfors. Computation of harmonic measure by L. Ahlfors' method, by G. Blanch and L. K. Jackson.

Note: This collection of six papers is a sequel to *Construction and applications of conformal maps* (Applied mathematics series, 18) now out of print. It contains descriptions and evaluations of three computational experiments in the general field of conformal mapping. One of these was carried out by desk calculation, one by punched card equipment, and one on the National Bureau of Standards Eastern Automatic Computer (SEAC) Literature references are included.

WALKER, ROBERT JOHN

Algebraic curves. Princeton Princeton University Press, 1950 201 p 24 cm (Princeton mathematical series, edited by Marston Morse and A. W Tucker, No 13) $4 00 504

Contents Algebraic preliminaries. Projective spaces. Plane algebraic curves. Formal power series. Transformations of curve. Linear series. Index.

Note. An introductory text in algebraic geometry In order to keep the presentation simple, the book has been limited to the theory of curves. All theorems are proved, and exercises are included in the text for students to work. The study is carried as far as the theorem of Riemann-Roch.

WOLFE, HAROLD E

Introduction to non Euclidean geometry New York The Dryden Press, 1945 247 p illus 21 cm (The Dryden Press mathematics publications, Edwin R. Smith, general editor) $5 00 505

Contents The foundation of Euclidean geometry The fifth postulate. The discovery of non-Euclidean geometry Hyperbolic plane geometry Hyperbolic plane trigonometry Applications of calculus to the solutions of some problems in hyperbolic geometry Elliptic plane geometry and trigonometry The consistency of the non-Euclidean geometries. Appendices The foundation of Euclidean geometry Circular and hyperbolic functions. The theory of orthogonal circles and allied topics. The elements of inversion. Index.

Note Although intended for college students and secondary school teachers of geometry this introductory text contains considerable material that is of interest to those who study mathematics by themselves. The history of non-euclidean geometry is given at some length and a large number of problems has been supplied, not merely as practice material but as means of presenting important concepts. Mathematically rigorous treatment of the subject is not intended. However the reader should be familiar with euclidean geometry and, preferably also with calculus. A preliminary edition was issued in 1941

YANO, K., AND S BOCHNER

Curvature and Betti numbers Princeton Princeton University Press 1953 190 p 26 cm. (Annals of mathematics studies edited by Emil Artin and Marston Morse. No 32) $3.00 506

Contents Riemannian manifold. Harmonic and killing vectors. Harmonic and killing tensors. *Harmonic and killing tensors in* flat manifolds. Deviation from flatness. Semi-simple group spaces. Pseudo-harmonic tensors and pseudo-killing tensors in metric manifolds with torsion. Kaehler manifold. Supplements (written by S. Bochner) Bibliography

Note An important contribution to differential geometry concerned with the relations between the Betti numbers of a compact Riemannian manifold and the Riemann-Christoffel curvature tensor of the manifold. It is based largely on the studies of Professor Bochner The final chapter included to afford the reader a few of the wider aspects of the topic, was written by Professor Bochner himself.

NUMERICAL ANALYSIS AND GRAPHIC METHODS

BOOTH, ANDREW D

Numerical methods New York Academic Press, Inc., 1955 195 p illus 23 cm 507

Content The nature and purpose of numerical analysis. Tabulations and differences. Interpolation. Numerical differentiation and integration. The summation of series. The solution of ordinary differential equations. Simultaneous linear equations. Partial differential equations. Non-linear algebraic equations. Approximating functions. Fourier synthesis and analysis. Integral equations. Select bibliography Name index. Subject index.

Note A brief but useful review of numerical techniques of mathematical analysis. Principles rather than computational exercises are emphasized, hence, such techniques as Monte Carlo methods are explained in about two pages, and even Fourier synthesis and analysis is given only 10 pages. However literature references are supplied for readers who need more detail. The material was first prepared for delivery as lectures, and the lecture style is still obvious in the short chapters and compact organization of the book. Although of potential interest to any scientist in need of survey of numerical methods, it is addressed particularly to advanced students of mathematics and graduate mathematicians who are concerned with programming for electronic digital computers. A second edition was published in 1957 $6.50.

DAVIS, DALE S

Nomography and empirical equations New York Reinhold Publishing Corporation, 1955 236 p illus 24 cm. $6 75 508

Contents. Part I, Empirical equations Common linear logarithmic, and semilogarithmic forms. Two-variable correlation—less common forms. Two-variable correlation—special methods. Three-variable correlation. Part II, Nomography Addition charts. Logarithmic charts. Nonlogarithmic multiplication charts. Recurrent variable charts. Combination charts. *Line coordinate* charts. Graphical anamorphosis. Appendix. Index.

Note A successor to the author's *Empirical equations and nomography* New York McGraw-Hill, 1943 Since publication of the first edition, the book has been widely used both for the instruction of engineering students and as refresher and reference book for working engineers. The scope is unchanged in this new edition. However numerous useful changes have been made, changes designed to facilitate understanding of the book and to enhance its usefulness. The quantity of matter in the book has been substantially increased however considerable fraction of the increase is due to the inclusion of more problems for the reader to solve.

DOUGLASS, *RAYMOND DONALD, AND* DOUGLAS P ADAMS

Elements of nomography New York Mc Graw Hill Book Company Inc. 1947 209 p. illus 23 cm $5 00 509

Contents Definition and reading of scales *Scale equations.* Uniform and nonuniform scales. *Adjustment of scales to one. Adjustment of* scale to zero point. Drafting the scale. Stationary adjacent scales. Simple alignment diagrams. The basic parallel-line diagram for the equation $U + V = W$ Substitutions. The use of printed forms. Dependent and independent variables—limits. Simple variations in chart form. *Multiplication by the Type II diagram. A diagram based* on two parallel lines and third slanting line. The hexagonal alignment diagram for the equation $\frac{1}{U} + \frac{1}{V} = \frac{1}{W}$. The circular nomogram for the equation $U\ V = W$ Compound alignment diagrams—graphical devices—analytic geometry diagrams. Index.

Note Nomographs, popularly known as alignment diagrams, are widely used in all branches of engineering, science, and industry for the graphic presentation of mathematical laws and relationships. This volume outlines the theory behind such charts and describes the techniques of their construction. The book is intended to serve as an

introduction to the subject and is written for professional engineers, scientists, business men, and students. Emphasis is placed on actual constructional problems, and several full-scale charts illustrating their application in science and business are included.

HEACOCK, FRANK A.

Graphic methods for solving problems. Princeton Princeton University Store, 1952 113 p. 28 cm. $1 90 510

Contents: Simple graphs and charts. The hydrograph. Geometric diagrams. Network charts. Vectors and mechanics. Descriptive geometry. Nomographs and computing devices. Graphic analysis. General bibliography. Index.

Note: Primarily this book is an annotated, bibliographical guide to the articles and books on graphic methods that have been published from 1937 through 1952. However, each of the chapters begins with a section in which a particular type of graphic device or method is carefully defined and illustrated. The main emphasis is on engineering uses of graphic methods, but some material is included on pictorial charts and other devices that are used in a number of fields. The book is a development of research undertaken for a committee of the American Society for Engineering Education.

Although of potential interest to any scientist in need of a survey of numerical methods, it is addressed particularly to advanced students of mathematics and graduate mathematicians who are concerned with programming for electronic digital computers. *A second edition was published in 1957 $6.50.*

DAVIS, DALE S

Nomography and empirical equations New York Reinhold Publishing Corporation, 1955 236 p illus. 24 cm. $6 75 508

Contents Part I, Empirical equations Common linear logarithmic, and semilogarithmic forms. Two-variable correlation—less common forms. Two-variable correlation—special methods. Three-variable correlation. Part II Nomography Addition charts. Logarithmic charts. Nonlogarithmic multiplication charts. Recurrent variable charts. Combination charts. *Line coordinate* charts. Graphical anamorphosis. Appendix. Index.

Note A successor to the author's *Empirical equations and nomography* New York, McGraw Hill, 1943 Since publication of the first edition, the book has been widely used both for the instruction of engineering students and as a refresher and reference book for working engineers. The scope is unchanged in this new edition. However numerous useful changes have been made changes designed to facilitate understanding of the book and to enhance its usefulness. The quantity of matter in the book has been substantially increased however a considerable fraction of the increase is due to the inclusion of more problems for the reader to solve.

DOUGLASS, RAYMOND DONALD AND DOUGLAS P ADAMS

Elements of nomography New York Mc Graw Hill Book Company, Inc 1947 209 p. illus 23 cm $5 00 509

Contents Definition and reading of scales. *Scale equations.* Uniform and nonuniform scales. *Adjustment of scales to size.* Adjustment of scale to zero point. Drafting the scale Stationary adjacent scales. Simple alignment diagrams. The basic parallel-line diagram for the equation $U + V = W$ Substitutions The use of printed forms. Dependent and independent variables—limits. Simple variations in chart form. Multiplication by the Type II diagram. A diagram based on two parallel lines and a third slanting line. The hexagonal alignment diagram for the equation $\frac{1}{U} + \frac{1}{V} = \frac{1}{W}$. The circular nomogram for the equation $U \cdot V = W$ Compound alignment diagrams—graphical devices—analytic geometry diagrams. Index.

Note Nomographs, popularly known as alignment diagrams, are widely used in all branches of engineering, science, and industry for the graphic presentation of mathematical laws and relationships This volume outlines the theory behind such charts and describes the techniques of their construction. The book is intended to serve as an

introduction to the subject and is written for professional engineers, executives, business men, and students. Emphasis is placed on actual constructional problems, and several full-scale charts illustrating their application in science and business are included.

Heacock, Frank A.

Graphic methods for solving problems. Princeton Princeton University Store 1952 113 p. 28 cm. $1 90 510

Contents: Simple graphs and charts. The hydrograph. Geometric diagrams. Network charts. Vectors and mechanics. Descriptive geometry. Nomographs and computing devices. Graphic analysis. General bibliography. Index.

Note: Primarily this book is an annotated, bibliographical guide to the articles and books on graphic methods that have been published from 1937 through 1950. However, each of the chapters begins with a section in which a particular type of graphic device or method is carefully defined and illustrated. The main emphasis is on engineering uses of graphic methods, but some material is included on pictorial charts and other devices that are used in a number of fields. The book is a development of research undertaken for a committee of the American Society for Engineering Education.

Hildebrand F B

Introduction to numerical analysis. New York McGraw Hill Book Company Inc., 1956 511 p. 24 cm (International series in pure and applied mathematics William Ted Martin, consulting editor) $8.50. 511

Contents: Introduction. Interpolation with divided differences. Lagrangian methods. Finite-difference interpolation. Operations with finite differences. Numerical solution of differential equations. Least-squares polynomial approximation. Gaussian quadrature and related topics. Approximations of various types. Numerical solution of equations. Appendixes: Justification of the Crout reduction. Bibliography. Directory of methods. Index.

Note: A textbook developed at the Massachusetts Institute of Technology where the author is Associate Professor of Mathematics. A major aim of the work is to prepare the reader to use computers, both desk calculators and electronic machines; however the emphasis is on basic concepts and techniques, such as approximation, interpolation, numerical solution of equations, smoothing of data, and the numerical summation of series. Programming for electronic computers is not covered. Included are a wide range of problems, many of which are designed for computation on desk calculators.

Hoelscher, Randolph Philip and others

Graphic aids in engineering computation by Randolph P Hoelscher Joseph Norman Arnold and Stanley H. Pierce. New York McGraw Hill Book Company Inc. 1952 197 p. illus. 24 cm. $4 50 512

Contents: Standard slide rules. Empirical equations from engineering data. Alignment charts. Graphical calculus. Alignment charts with determinants. Special slide rules. Movable-scale nomographs. Index.

Note: An introduction for engineering college students. The construction of alignment charts is covered with exceptional thoroughness. Slide rules are discussed more briefly but the most essential information is given and the discussion of special slide rules is related to that of alignment charts. The first-named author is head of the Department of Engineering Drawing of the University of Illinois.

Householder, Alston S

Principles of numerical analysis. New York McGraw Hill Book Company Inc., 1953 274 p. 24 cm. (International series in pure and applied mathematics William Ted Martin, consulting editor) $6.00 513

Contents: The art of computation. Matrices and linear equations. Nonlinear equations and systems. The proper values and vectors of matrix. Interpolation. More general methods of approximation. Numerical integration and differentiation. The Monte Carlo method. Bibliography. Problems. Index.

Note: Although this book is addressed to graduate students and graduate mathematicians who are concerned with devising routines for modern calculating machines, particularly electronic computers, background knowledge, rather than computational techniques, is the primary subject. A considerable part of the space is devoted to methods of inversion and decomposition of matrices. The account of the Monte Carlo method is a very short one, which is, however, supplemented by references to the literature published through 1952. The author is Senior Mathematician on the staff of the Oak Ridge National Laboratory.

Johnson Lee H

Nomography and empirical equations. New York John Wiley & Sons, Inc. 1952 152 p illus. 23 cm. $4.00. 514

Contents: Part I, Nomography: Introduction. Parallel scale nomographs. Z-charts. Parallel and perpendicular index lines. Concurrent scales. Recurrent variables. Combined nomographs. Part II, Empirical equations: Methods of curve fitting. Curves with two constants. Curves with three constants. Curves with four constants. Index.

Note: A useful book directed to physicists, engineers, and others who wish to make use of graphic methods in computation. It is well arranged, and its explanations are written out fully in a lucid style. Numerous examples of nomograph construction and of curve fitting are included. Readers need only a mathematical knowledge covering logarithms, plane geometry and analytical geometry.

Kopal, Zdenek

Numerical analysis with emphasis on the application of numerical techniques to problems of infinitesimal calculus in single variable. New York John Wiley & Sons, Inc., 1955 556 p. illus 23 cm. $12 00 515

Contents: Introduction. Polynomial interpolation. Numerical differentiation. Integration of ordinary differential equations. Boundary-value problems—algebraic methods—variational, iterative, and other methods. Mechanical quadratures. Numerical solution of integral and integro-differential equations. Appendices. Name index. Subject index.

Note: Several factors, not the least of which is the availability of electronic computers, have combined to make an understanding of the techniques of numerical analysis essential to present-day physicists and engineers. This book, which is at the same time thorough and practical, is a help to physicists and engineers in acquiring this knowledge. In the introductory chapter the author states, "... the essence of numerical analysis [is] namely to use the methods of the infinitesimal calculus when they represent short cut, but to avoid them by a recourse to algebra when they become unmanageable." The chapter titles quoted above indicate the arrangement and scope of the work. The appendices contain a variety of expository material that complements the main body of the work and in some instances is more difficult mathematically. The matter in the book was first delivered as lectures at the Massachusetts Institute of Technology and elsewhere.

Kraitchik Maurice

Alignment charts—construction and use Princeton D Van Nostrand Company Inc., 1944 94 p. illus. 23 cm. $3.00. 516

Contents: The reader's preliminary Introduction. Graduation of scales. Conversion scales. Alignment charts. Equidistant parallel scales. Parallel scales not equidistant. Two parallel scales. Functions of more than three variables. The choice among different representations. Special charts. The reader's prospect. Index.

Note: An introductory book on the construction of nomographic charts. The book is intended mainly for scientists, engineers, and others who have practical use for such charts in the solving of equations.

Levens Alexander Sander

Nomography New York John Wiley & Sons, Inc., 1948 176 p. illus. 23 cm. $5.00. 517

Contents Introduction. Functional scales. Alignment charts. Alignment charts (Z charts) for the solution of equations of the form $f_1(\ ) = f_2(v)\,f(w)$. Other forms of equations which can be solved by a Z chart: $f(\ ) + f(\ ) = \frac{f_1(\ )}{f(w)}$ Alignment chart for the solution of equations of the form: $\frac{1}{f(\ )} + \frac{1}{f_1(v)} = \frac{1}{f(w)}$ Alignment charts for equations of four or more variables of the form: $f(\ ) + f(\ ) + f(w) = f(q)$. Proportional charts of the form $\frac{f(\ )}{f_1(v)} = \frac{f_2(w)}{f(q)}$ Proportional charts of the form: $f(\ ) + f(\ ) = \frac{f(w)}{f(q)}$ Alignment charts for the solution of equations of the form: $f(\ ) + f(\ )\,f(w) = f(w)$. Miscellaneous forms. Practical short-cuts in the design of alignment charts. The use of determinants in the design and construction of alignment charts. Bibliography Index to ppendix alignment charts. Appendix. Index.

Note An excellent introduction to the construction and uses of nomograms or alignment charts. Based on material developed for use in senior elective courses at the University of Minnesota and the University of California, it is organized primarily as textbook. However it is suitable for self-instruction for engineers, scientists and others who make frequent use of mathematical equations. Many worked examples as well as problems for the student to work are incl ded. The fundamentals of the subject are stressed, but the practical applications are clearly indicated.

MILNE, WILLIAM EDMUND

Numerical calculus, approximations, interpolation, finite differences, numerical integration and curve fitting Princeton Princeton University Press 1949 393 p 24 cm. $4.50 518

Contents Simultaneous linear equations. Solution of equations by successive approximations. Interpolation. Numerical differentiation and integration. Numerical solution f differential equations. Finite differences. Divided differences. Reciprocal differences. Polynomial approximation by least squares. Other approximations by least squares. Simple difference equations. Appendices Notation and symbols. Texts, tables, and bibliographies. Classified guide to formulas and methods. Tables. Index.

Note The translation of theoretical analysis into numerical results is the basic theme in this book. Written for upperclass undergraduate college students who have some knowledge of calculus and differential equations, it points the way to practical applications of more advanced mathematical methods. The specific methods covered are named in the chapter titles. The bibliography which is annotated, lists books and pamphlets on related techniques not covered in this work.

MILNE, WILLIAM EDMUND

Numerical solution of differential equations New York John Wiley and Sons, Inc., 1953 275 p illus 24 cm (Applied mathematics series, edited by I S Sokolnikoff) $7 25 519

Contents Part I, Ordinary equations I troduction. Elementary numerical solution. Analytical foundations. Methods based on numerical integration. Methods of Runge Kutta. Methods based on higher derivatives. Systems of equations. Higher-order equations. Two-point boundary conditions. Part II, Partial equations Explicit methods. Parabolic and hyperbolic equations. Linear equations and matrices. Implicit methods. Elliptic equations. Characteristic numbers. Appendices. Bibliography Index.

Not An introduction to the use of numerical methods in the solution of ordinary and partial differential equations. It is addressed to students and readers who are primarily interested in numerical methods as practical means of obtaining solutions to problems in physics, engineering, etc. In the first part, among other things, the author explains 13 methods and particularly recommends two of them to the practical reader who is interested only in knowing a good up-to-date method The exposition is explicit and detailed and includes many examples of typical computations on computing machines of the desk type. However in an appendix the author discusses briefly the potentialities of electronic and other large-scale computing machines and their probable effects upon numerical methods in the near future. The bibliography includes more than 130 literature citations.

NIELSEN, KAJ L

Methods in numerical analysis. New York The Macmillan Company, 1956 382 p 22 cm. $6 90 520

Contents Fundamentals. Finite differences. Interpolation. Differentiation and integration. Lagrangian formulas. Ordinary equations and systems. Differential and difference equations. Least squares and their application. Periodic and exponential functions. Bibliography Tables. Answers to the exercises. Index.

Note. This text is designed to acquaint engineers, and others whose interests in mathematics are practical, with the basic methods of numerical analysis, particularly the analysis of tabulated data and numerical methods of finding the solutions to equations. The treatment, although introductory in nature, does require a knowledge of mathematics, at least through calculus. Particular attention is given to methods which may be used in solving problems on automatic desk calculators. Numerous exercises and illustrative examples, as well as tables required for the solution of problems, are included.

RUNNING, THEODORE RUDOLPH

Graphical calculus Ann Arbor George Wahr, 1937 83 p illus 23 cm. $1 90 521

Contents The principle of areas. Graphical differentiation. Graphical integration. Solution of equations. Graduation of unweighted data. Graphical interpolation. Graduation of weighted data. First kind. Second kind. Condition imposed upon derived curve. Graduation of data by means of the second derivative. Index.

Note This brief manual aims to make use of the graphical method as tool. It is planned for those who have had an elementary course in calculus and wish to make use of the graphical method in the treatment of data, particularly for students in applied science who deal with experimental data. The graduation of data is accomplished graphically without the use of formulas, moments, or least squares.

SCARBOROUGH, JAMES B

Numerical mathematical analysis. Third edition. Baltimore The Johns Hopkins Press 1955 554 p illus. 23 cm. $6.00 522

Contents The accuracy of approximate calculations. Interpolation *Differences—Newton's formulas of interpolation—Central-difference formulas—Lagrange's formula—Inverse interpolation.* The accuracy of interpolation formulas. Interpolation with two independent variables—trigonometric interpolation. Numerical differentiation and integration. *The accuracy of quadrature formulas.* The solution of numerical algebraic and transcendental equations Equations in one unknown. Simultaneous equations. Graeffe's root-squaring method for solving algebraic equations. The numerical solution of ordinary differential equations: *Equations of the first order* Equations of the second order and systems of simultaneous equations. The differential equations of exterior ballistics. Other methods of solving differential equations numerically The numerical solution of partial differential equations Difference quotients and difference equations. The method of iteration. The method of relaxation. The Rayleigh-Ritz method. The numerical solution of integral equations. The normal law of error and the principle of least squares. The precision of measurements Direct measurements Indirect measurements. Empirical formulas. Harmonic analysis of empirical functions. Numerical solution of the simultaneous linear equations Solution by determinants. Solution by successive elimination of the unknowns. Solution by inversion of matrices. Solution by iteration. Appendix—*Tables of the probability integral.* Index. Answers to exercises. Index.

Note. The principles of numerical analysis, methods for obtaining numerical results, and methods for checking the accuracy of these results are explicitly described in this outstanding work. Several methods are described for some operations. The exposition includes number of examples worked out in detail and—in some chapters—is also supplemented by full verbal discussions of the uses and limitations of the various methods. The first edition was published in 1930 and the second edition in 1950. In comparison with the second edition, this third edition has one new chapter that on the numerical solution of simultaneous linear equations.

SCHMID, CALVIN F

Handbook of graphic presentation New York The Ronald Press Company, 1954 316 p. illus. 24 cm. $6 00 523

Contents: Basic principles and techniques of chart design. Drafting techniques. Rectilinear coordinate charts. Bar and column charts. Semilogarithmic or ratio charts. Frequency graphs and related charts. Miscellaneous graphic forms. Statistical maps. Pictorial charts. Projection techniques in graphic presentation. Reproduction of graphs and charts. Index of names. Index of subjects.

Note: An eminently practical manual on the design and construction of charts and graphs for the presentation of statistical data. Although it contains much material useful to statisticians, it is primarily a book for the nonspecialist—such a person as a scientist who wishes to present the results of a series of experiments to readers outside his special field. The author himself is a sociologist, and there is some emphasis on the presentation of social and economic data. However the principles and most of the techniques described have general application. Most types of graphs and charts are discussed, as the chapter titles show. The chapter entitled "Miscellaneous graphic forms" is devoted to such varieties as pie charts and flow charts. Many typical charts are reproduced.

APPLIED MATHEMATICS

ALLEN EDWIN BROWN AND OTHERS

Vital mathematics by Edwin Brown Allen, Dis Maly and S Herbert Starkey jr New York The Macmillan Company 1944 456 p. illus. 22 cm. $4.84 524

Contents: Whole numbers. Common fractions. Decimal fractions. Percentage. Denominate numbers; ratio and proportion. Certain rudiments of statistics. Introduction to geometric figures. From arithmetic to algebra. Signed numbers. Fundamentals of algebraic operations. Graphs. Drawings and constructions. Areas of plane surfaces. Simple equations in one unknown. Relations existing within geometric figures. Locus. Relations between geometric figures. Trigonometry of the right triangle. Introduction to solid geometry. Some geometric solids. The sphere. Pairs of simultaneous equations. Exponents, logarithms, and the slide rule. The trigonometric ratios for angles greater than 90°. The solution of oblique triangles. Some spherical trigonometry. Appendix. Index. Answers.

Note: A review book intended for adults. No previous mathematical training is necessary. The book is directed toward military applications, with extensive use of vector diagrams and navigation problems.

AMERICAN MATHEMATICAL SOCIETY

Non-linear problems in mechanics of continua. Providence American Mathematical Society 1949 219 p. illus. 23 cm. (Symposia in Applied Mathematics Proceedings. Volume I) $5.25 525

Contents: Hydrodynamics: Non-linear problems in the theory of fluid motion with free boundaries, by A. Weinstein. Operator methods in the theory of compressible fluids, by S. Bergman. An existence theorem in two-dimensional gas dynamics, by L. Bers. Recent developments in free boundary theory, by G. Birkhoff. Theory and propagation of shock waves from cylindrical charges of explosives, by S. R. Brinkley jr and J. G. Kirkwood. The method of characteristics in the three-dimensional stationary supersonic flow of a compressible gas, by N. Coburn and C. L. Dolph. The numerical solution of the turbulence problem, by H. W. Emmons. On the stability of transonic flow, by Y. H. Kuo. Stability of the laminar boundary layer in a compressible fluid, by L. Lees. Remarks on the spectrum of turbulence, by C. C. Lin. Two-dimensional compressible flows, by I. Opatowski. Polygonal approximation method in the hodograph plane, by H. Poritsky. The boundary layer of yawed cylinders, by W. R. Sears. On shock-wave phenomena—interaction of shock waves and gases, by H. Polachek and R. J. Seeger. The breaking of waves in shallow water, by J. J. Stoker. On Hamilton's principle for perfect compressible fluids, by A. H. Taub. Elasticity and plasticity: The foundations of the theory of elasticity, by F. D. Murnaghan. On dynamic structural stability, by G. F. Carrier. Stress-strain relations for strain-hardening materials—discussion and proposed experiments, by D. C. Drucker. The edge effect in bending and buckling with large deflection, by K. O. Friedrichs. Numerical methods in the solution of problems of non-linear problems of elasticity, by W. Kaplan. Large deflection theory for rectangular plates, by S. Levy. Discontinuous solutions in the theory of plasticity, by W. Prager. On finite deflections in circular plates, by E. Reissner.

—— Electromagnetic theory Providence American Mathematical Society 1950 91 p. illus. 25 cm. (Symposia in Applied Mathematics. Proceedings. Volume II) $3.00 526

Contents: The new quantum electrodynamics, by H. Feshbach. A method of analytical continuation in the eigenvalue and scattering problems of quantum theory (abstract) by E. Feenberg. Electromagnetism without metric, by J. L. Synge. Discontinuity in electromagnetism, by W. H. Watson. The factorization method and its application to differential equations in theoretical physics, by L. Infeld. Nonlinear electrical networks, by R. J. Duffin. Ray theory vs. normal mode theory in wave propagation problems, by C. L. Pekeris. Systems of Wiener-Hopf integral equations and their application to some boundary value problems in electromagnetic theory by A. E. Heins. Orbits of charged particles in constant fields (abstract) by A. H. Taub. Reflections from bends and corners in electromagnetic wave guides (abstract) by S. O. Rice. Wave propagation in electromagnetic horns (abstract) by A. F. Stevenson. Problems related to measuring the field strength of high frequency electromagnetic fields (abstract) by R. Truell. Aberration correction with electron mirrors (abstract), by E. G. Ramberg. Distribution problems in the theory of random noise (abstract) by M. Kac. Entropy and information (abstract) by N. Wiener. The statistical theory of message transmission (abstract) by Y. W. Lee. Transient response in the central limit theorem of probability (abstract), by H. Wallman.

—— Elasticity New York McGraw Hill Book Company Inc., for the American Mathematical Society 1950 233 p. illus. 25 cm. (Symposia in Applied Mathematics. Proceedings Volume III) $6.00 527

Contents: Approximate methods of solution of two-dimensional problems in anisotropic elasticity by I. S. Sokolnikoff. Beams under concentrated loading, by O. E. Hay. On axisymmetrical deformations of thin shells of revolution, by D Reissner. On asymptotic integration in shell theory, by F. B. Hildebrand. Some recent applications of the theory of finite elastic deformation, by R. S. Rivlin. Elastic stability of the facings of sandwich columns, by H. W. March. Dynamic loads on thin plates on elastic foundations by Y A Hall. Kirchhoff's boundary conditions and the edge effect for elastic plates, by K. O. Friedrichs. Some problems in the bending of thin plates, by G. F. Carrier and F. S. Shaw. Prestressing a plane circular plate to stiffen it against buckling (abstract) by J. J. Stoker. The bending of thin elliptic plates, by C. L. Perry. New methods for the estimation of torsional rigidity by A. Weinstein. Stress fields of axially symmetric shafts in torsion and related fields, by H. Poritsky. Stress analysis in elastic-plastic structures, by W. Prager and P. S. Symonds. Elastic-plastic straining (abstract), by R. Southwell. A graphical method for solving problems in plane plasticity by N. Coburn. On stress discontinuities in plane plastic flow by E. H. Lee. Index.

—— Fluid dynamics. New York McGraw Hill Book Company Inc., for the American Mathematical Society 1953 186 [illegible] illus. 25 cm. (Symposia in Applied Mathematics. Proceedings. Volume IV) $7.00 528

Contents: Some aspects of the statistical theory of turbulence, by S. Chandrasekhar. A critical discussion of similarity concepts in isotropic turbulence, by C. C. Lin. The nonexistence of transonic potential flow, by A. Busemann. On waves of finite amplitude in ducts (abstract) by R. E. Meyer. On the problem of separation of supersonic flow from curved profiles, by T. Y. Thomas. On the construction of high-speed flows, by G. F. Carrier and K. T. Yen. An example of transonic flow for the Tricomi gas, by M. H. Martin and W. R. Thickstun. On gravity waves, by A. E. Heins. Hydrodynamics and thermodynamics, by S. R. De Groot. Nonuniform propagation of plane shock waves, by J. M. Burgers. Theory of propellers, by T. Theodorsen. Numerical methods in conformal mapping, by G. Birkhoff and others. Flow of viscous liquid through pipes and channels, by J. L. Synge. The method of singularities in the physical and in the hodograph plane, by A. Weinstein. Index.

—— Wave motion and vibration theory New York McGraw Hill Book Company Inc., for the American Mathematical Society

1954 169 p illus 26 cm. (Symposia in Applied Mathematics Proceedings. Volume v) $7 00 529

Contents Hydrodynamic stability by C. C. Lin. Examples of the instability of fluid motion in the presence of magnetic field, by S. Chandrasekhar On free surface flows, by P R. Garabedian. Review of significant observations on the mach reflection of shock waves, by W Bleakney On a nonlinear differential equation in hydraulics, by N W McLachlan. Acoustic radiation pressure on a circular disk, by H. Levine. Infinite matrices associated with diffraction problem (abstract) by W Magnus. On the coupling of two half planes, by A. E. Heins and H. Feshbach. On the diffusion of tides into permeable rock, by G. F Carrier and W H. Munk. Some remarks on radiation conditions, by J J Stoker On the theory of scattering of plane waves by soft obstacle, by E. W Montroll and J M. Greenberg. W ve propagation in helical compression springs, by E. H. Lee. On the wave equation and the equation of Euler Poisson, by A. Weinstein. On Lienard's differential equation, by S. Lefschetz. The effect of small constraints on natural vibrations, by R. J Duffin and A. Schild. Index.

—— *Numerical analysis. New York* Mc Graw Hill Book Company, Inc., for the American Mathematical Society, 1956 303 p illus. 25 cm. (Symposia in Applied Mathematics Proceedings Volume vi) $9 75 530

Contents Computational problems in the theory of dynamic programming, by R. Bellman. Some methods for the solution of boundary-value problems of linear partial differential equations, by S. Bergman. Computational aspects of certain combinatorial problems, by R. H. Bruck. N merical results on the shock configuration in mach reflection, by D R. Clutterham and A. H. Taub. Some applications of gradient methods, by J W Fischbach. Some qualitative comments on stability considerations in partial difference equations, by S. P Frankel. Approximations in numerical analysis—a report on study by C. Hastings, jr and others. The conjugate-gradient method for solving linear systems, by M. R. Hestenes. Number theory on the *SWAC*, by E. Lehmer The assignment problem, by T S. Motzkin. The method of steepest descent, by P C. Rosenbloom. Function spaces and approximation by A. Sard. Some computational problems in algebraic umber theory by O. Taussky Machine attacks on problems whose variables are permutations, by C. B Tompkins. Best-approximation polynomials of given degree, by J L. Walsh. Recent results in numerical methods of conformal mapping by S. E. Warschawski. On the asymptotic transformation of certain distributions into the normal distribution, by W Wasow Error bounds for eigenvalues of symmetric integral equations, by H. Wielandt. On the solution of linear systems by iteration, by D Young. Index.

Note. Participants in the *Symposia in Applied Mathematics* include many of the most eminent mathematicians currently working in the United States of America, and many of the papers in these volumes are the first presentations of the results of recent work. Literature references are often included

AMERICAN MATHEMATICAL SOCIETY

Transactions of the Symposium on Computing Mechanics Statistics and Partial Differential Equations held at the University of Chicago, April 29–30 1954 The Second Symposium on Applied Mathematics sponsored by The American Mathematical Society and Office of Ordnance Research U S Army Editorial committee F E Grubbs, F J Murray and J J Stoker New York Interscience Publishers 1955 216 p illus 26 cm $5 00 531

Contents Operations research, by P M Morse. The problem of inductive inference, by J Neyman. Some recent developments in analysis of variance, by H. O Hartley Two unsolved problems in statistical mechanics, by J E. Mayer Iterative computational methods, by M. R. Hestenes. Motivations for working in umerical analysis, by J Todd. Some umerical computations in ordnance problems, by A. A. Bennett. The simplest rat theory of pure elasticity by C. A. Truesdell. On the stability of mechanical systems, by J J Stoker Divergent integrals and partial differential equations, by F Bureau. On *differential operators* and boundary conditions, by W Feller.

Note. As their titles indicate, most of the papers in this volume would classify as applied mathematics at a high level. Several of the more important ones are reports f work sponsored by the Office of Ordnance Research. These represent advances in applied mathematics or in some instances, advances in pure mathematics which are probably capable of application in the solution of problems in *science and engineering*. In contrast, Morse's paper on operations research is only a generally informative account of the scope and methods of this field, and Bennett's paper on numerical computations in ordnance problems is brief informative account of the current work of the Computing Laboratory of the Ballistic Research Laboratories f the Ordnance Corps.

ANDRES, PAUL G , AND OTHERS

Basic mathematics for science and engineering By the late Paul G Andres, Hugh J Miser, and Haim Reingold New York John Wiley & Sons, Inc., *1955 846 p 24 cm $6 75* *532*

Contents Numerical computations. Simple algebraic operations. Functions and their graphs. Trigonometric functions. The graphs of the trigonometric functions. Simple properties of vectors. Algebraic operations. Exponents and radicals. Logarithms. The fundamental relations of trigonometry The oblique triangle. The *j* operator Linear equations and determinants. Quadratic equations and equations of higher degree. The straight line. Circles and loci. Equations of the second degree the conics. Elements of solid analytic geometry The elements of differential calculus. The elements of integral calculus. Appendix. Answers to the odd-numbered exercises. Index.

Note A revision of the author's *Basic mathematics for engineers*, New York, 1944 It is designed as a textbook for use in first courses in mathematics offered to college students who are majoring in *science or engineering The treatment assumes that the student* will have had courses in geometry and algebra in secondary school, but it does not assume an acquaintance with calculus. In fact, the two chapters on calculus are designed as preliminaries to later full-scale courses in the calculus. An abundance of exercises for the student to work is one of the features. In this new edition, the exercises have been selected to illustrate applications in science as well as in engineering. Other changes include an expansion of the treatment of analytic geometry *Essentially however* the contents, organization, and purpose of the book are unchanged from the preceding edition.

BRAND, LOUIS

Vector and tensor analysis. New York *John Wiley & Sons Inc., 1947 439 p* illus. 22 cm $6 50 533

Contents Vector algebra. Motor algebra. Vector functions of one variable. Linear vector functions. Differential invariants. Integral transformations. Hydrodynamics. Geometry on surface. Tensor analysis. Quaternions. Index.

Note The usefulness of a knowledge of vector and tensor analysis to scientists and *engineers who must deal with problems* in mechanics, hydrodynamics and electrodynamics is well established. This book is designed for students preparing to enter science or engineering, but it can also be used independently as survey of modern methods. In either case, sound knowledge of introductory college mathematics is prerequisite.

COBURN, NATHANIEL

Vector and tensor analysis New York The Macmillan Company 1955 341 p illus 24 cm. $7 00 534

Contents. Part I, Vector analysis. The fundamental operations. Differentiation theory Integration theory Vector analysis in applied *mathematics* Part II, Tensor analysis Tensors in Cartesian coordinates Tensors in general curvilinear coordinates. The theorems f Gauss and Stokes in *N*-dimensional euclidean space. Part III, Applications of tensor analysis The differential geometry of surfaces. Introduction to the theories f elasticity and viscous fluids. The theory of compressible fluids. The theory of homogeneous statistical turbulence Appendixes. Index.

Note An introduction to vector and tensor analysis intended for the instruction of senior and graduate college students. The treatment is slanted toward the interests of students, such as scientists and engineers who are interested in applications of vector and

tensor analysis techniques. Applications in fluid dynamics, rigid body dynamics and the study of turbulence are among those which are demonstrated. The author is Associate Professor of Mathematics in the University of Michigan.

Craig, Homer Vincent

Vector and tensor analysis. New York McGraw Hill Book Company Inc., 1943 434 p. illus. 23 cm. $6.50. 535

Contents (abridged): Preliminary remarks. Infinite sequences and functions. The calculus of functions of two variables. Generalized area and allied matters. Determinants, the n-systems, and certain transformation equations. The algebra of vectors. A simple N-dimensional space. The differential calculus of vectors. Integral transformations. The tensor concept. Extensors and the differential calculus of tensors. Classical dynamics. Special relativity. General relativity. Index.

Note: This textbook, based on a series of lectures, is intended to provide physics and engineering students with a working knowledge of advanced calculus. A background of general calculus is necessary. Four supplemental bibliographies are included.

Franklin, Philip

Fourier methods. New York McGraw Hill Book Company Inc., 1949 289 p. illus. 21 cm. $6.00 536

Contents: Complex quantities. Impedance. Fourier series and integrals. Partial differential equations. Boundary value problems. Laplace transforms. Transients. Bibliography. Index.

Note: A brief and general introduction to the use of Fourier series and Laplace transforms. Emphasis is on methods rather than theory, and the treatment assumes a knowledge of elementary calculus. The text is intended for college students majoring in applied mathematics, engineering, and physics, and the illustrative exercises and review problems have particular application in these fields.

Friedman, Bernard

Principles and techniques of applied mathematics. New York John Wiley & Sons, 1956 315 p. illus. 24 cm. $8.00. 537

Contents: Linear spaces. Spectral theory of operators. Green's functions. Eigenvalue problems of ordinary differential equations. Partial differential equations. Bibliography. Index.

Note: The purpose of this book is to introduce scientists and engineers who are interested in applied mathematics to some of the powerful methods of abstract mathematics which can be used in the applied fields. The first two chapters are devoted largely to an exposition of abstract linear spaces and operators defined on them. The final three chapters illustrate the applications of the theory and methods of linear spaces and operators to the solution of ordinary differential equations and partial differential equations. The book was developed during the author's teaching of graduate courses at the New York University and is consequently organized as a textbook. However, the expository text is full enough, and there are enough proofs of theorems and solutions of problems, to make the book useful to graduate scientists and engineers studying outside of organized courses.

Grazda, Edward E., editor

Handbook of applied mathematics. Third edition. Morris Brenner associate editor. Based on the original work by M. E. Jansson, H. D Harper and P L. Agnew. New York D Van Nostrand Company Inc., 1955 1,044 p. illus. 20 cm. $7.95 538

Contents: Introduction—key to use this book. Arithmetic—slide rule. Algebra. Geometry. Trigonometry. Differential calculus. Mechanics. Weights and measures. Excavation and foundations. Concrete. Brickwork. Carpentry and building. Lathing and plastering. Painting. Interlocking. Paving. Plumbing. Heating. Ventilating and air conditioning. Machine shop work. Sheet metal work. Electricity. Electronics. Print shop. Business mathematics. Accounting. Index of tables. Index.

Note: A reference book of the mathematics and computations of crafts and sciences. The early chapters deal generally with the symbols, conventions, and elementary computations of the fields of mathematics named in their titles. Most of the chapters are devoted, as their titles show, to the computational approaches to specific crafts, and in these chapters the main topic is mathematical computations; however, the fundamentals of the craft are also described. For example, in the chapter on plumbing, among the mathematical matter are descriptions of house plumbing systems, data on pipe sizes, and practical symbols used on building blueprints and related drawings. While basic, the book is thus suitable for instruction as well as for reference. The second edition was published in 1936 and appeared under the name of M. E. Jansson as author. Three new chapters have been added in this third edition, and revisions have been made in other chapters carried over from the second edition.

Hildebrand, Francis Begnaud

Methods of applied mathematics. New York Prentice-Hall Inc., 1952 523 p. illus. 22 cm. (Prentice Hall mathematics series Albert A. Bennett, editor) $9.00 539

Contents: Matrices, determinants, and linear equations. Calculus of variations and applications. Difference equations. Integral equations. Appendix. The Crout method for solving sets of linear algebraic equations. Answers to problems. Index.

Note: The author has stated that this book is designed to serve as an introduction to "four fields of mathematics which usually are not treated in courses of the 'advanced calculus' type but which are useful in varied fields of applications." The fields covered are named in the chapter titles. Although intended for readers whose main interests lie in such fields as physics and engineering, mathematics rather than applications are emphasized, and proofs are, generally speaking, included. It is suitable for use both as a text in graduate courses and for self-instruction material for graduate scientists and engineers. A feature which facilitates its use by the latter group is the independent treatment of each method and technique. In other words, it is not necessary to have mastered Chapter one in order to make use of Chapter three, for instance.

Klaf, A. Albert

Calculus refresher for technical men. New York Dover Publications Inc., 1944 431 p. illus. 20 cm. $1.95 540

Contents (abridged): Section I, Simple differential calculus: Constants—variables—functions—increments. Limits. Derivatives. Differentiation—elementary rules—algebraic—trigonometric. Differentiation by substitution. Maxima and minima. Splitting fractions to aid differentiation. Differentiation of logarithmic functions. Partial differentiation. Curvature of curves. Section II, Simple integral calculus: Integration—the inverse of differentiation. Integration by inspection. Integration by substitution. Integration by parts. Integration of fractions. Mean value. Successive and partial integration. Center of gravity. Moment of inertia. Introduction to differential equations. Section III, Applications of calculus. Appendix. Answers to problems. Index.

Note: A review book cast in question-and-answer form. As the title indicates, it is addressed primarily to readers who are interested in the applications of calculus. Nevertheless, 335 pages are devoted to basic aspects and only 33 pages to examples of applications. Answers are included for all problems to facilitate the use of the book in self-instruction. The book was originally published in 1944, and the present edition is a reprint without change in the text.

Klaf, A. Albert

Trigonometry refresher for technical men. New York Dover Publications Inc. 1946. 629 p. illus. 22 cm. $2.00 541

Contents (abridged): Section I, Plane trigonometry: Angles and their measurement. Cartesian coordinates—quadrants. Graphical representation of functions—periodicity. Interpolation. Trigonometric equations. Logarithms. Slide rule. Solution of triangles. Section II, Applications of plane trigonometry: Small angles. Vectors. Navigation. Polar coordinates—complex numbers—De Moivre's theorem—series. Section III, Spherical trigonometry: Spherical triangles. Applications. Appendix. Answers to odd-numbered problems. Index.

Note: In spite of the word "refresher" in the title this book is suitable for use in home-study by persons studying the subject for the first time. The exposition is entirely in question-and-answer form, and each topic is approached by easy stages. Tables of logarithms and trigonometric functions are given in the appendix. The above-listed edition is a 1956 reprint of the original edition.

MARGENAU, HENRY, AND GEORGE MOSELEY MURPHY

The mathematics of physics and chemistry Second edition New York D Van Nostrand Company, Inc., 1956 604 p illus 24 cm. $8 75 542

Contents The mathematics of thermodynamics. Ordinary differential equations. Special functions. Vector analysis. Coordinate systems, vectors, and curvilinear coordinates. Calculus of variations. Partial differential equations of classical physics. Eigenvalues and eigenfunctions. Mechanics of molecules. Matrices and matrix algebra. Quantum mechanics. Statistical mechanics. Numerical calculations. Linear integral equations. Group theory Index.

Note A successful presentation of mathematical concepts and techniques which are widely used in present-day physics and chemistry both pure and applied. The material presented in it has been selected from those areas of mathematics which are named in the chapter titles listed above In each, it provides definitions, explains the basic concepts, and furnishes examples of computations. Rigorous mathematical proofs are not included but references to books that do contain rigorous treatments are included in all chapters. The first edition was published in 1943 and was reprinted many times. This second edition is not an extensive revision however discovered errors in the first edition have been corrected, the presentation of a number of topics has been revised in the interest of clarity and a discussion of Laplace and related transformations has been added to the chapter on eigenvalues and eigenfunctions. The book is used as text in advanced college courses and as a desk reference book by graduate physicists and chemists.

PAGE, CHESTER H.

Physical mathematics. Princeton D Van Nostrand Company, Inc., 1955 329 p illus 24 cm. $7 50 543

Contents Introduction. Integration and differentiation. The vibrating string. The general problem in three dimensions. Eigenfunctions and eigenvalues. Geometrical interpretation of eigenfunctions. The separated equations. The nonhomogeneous problem. Integral equations. Methods of solving integral equations. The unbounded region. The Fourier integral. Passive physical systems. Viewpoints on Fourier transforms. The Laplace transform. Transient analysis. Difference equations. Partial differential equations. Index.

Note Addressed to graduate students of physics, this book is an attempt to teach mathematics to physicists in a manner which is in accord with physicist's way of thinking. The author states that "physicists do not generally appreciate all the implications of tersely stated theorems, but profit from looking at facts in several different ways. *My objective is to help physicists correlate their* smatterings of mathematical knowledge in such a way as to improve their feeling for the subject and increase its usefulness. It is emphasized that there are various ways of solving an equation, and that the physicist's problem is to select the one that will give the most useful solution. This theme runs through the chapters in which various mathematical techniques are expounded and applied to variety of physical problems. The book was developed in graduate courses given by the uthor at the National Bureau of Standards and the American University Washington, D C.

PHILLIPS, HENRY BAYARD

Analytic geometry and calculus. Second edition. New York John Wiley & Sons Inc. 1946 504 p illus 22 cm. $5 50 544

Contents Limits and continuity Derivative and differential. Integration and summation. Algebraic equations and graphs. Determinants. Trigonometric functions. Exponential and logarithmic functions. Parametric equations. Polar coördinates. Vectors. Formulas and methods of integration. Further applications of integration. Series with real terms. Complex umbers. Space coördinates and vectors. Partial differentiation. Multiple integration. Answers to problems. Tables. Index.

Note An introductory textbook for students of engineering and science. By relating the content of analytic geometry and calculus and thus combining two courses in one the author not only has emphasized the mutual dependence of the two subjects but also has made available valuable time for use elsewhere in crowded college curriculums. Early discussion of the differential and integral provides for the use f these important mathematical notions in accompanying science courses. Changes made in this second edition include minor rewriting and rearrangement, and a new smaller format which entailed complete resetting of the type.

PHILLIPS, HENRY BAYARD

Vector analysis. New York John Wiley & Sons, Inc., 1933 236 p illus. 22 cm $4.00 545

Contents Elementary operations. Partial differentiation. Integration. General coordinates. Irrotational and solenoidal vectors. Electrostatic fields. Harmonic functions. Scalar and vector potentials. Linear ector functions. Index.

Note. In this book vector analysis is presented in the form that is required for work in theoretical electricity and hydrodynamics. For these subjects the analysis of vector fields and the study of the quantities which characterize each type of field are of primary importance as the book brings out. The discussion of these matters separately rather than their introduction in connection with one of the typical fields enables the book to show which results follow from mathematics and which are dependent on physical hypothesis.

REEVE, WILLIAM D, AND CLARENCE E TUITES

Practical mathematics refresher New York McGraw Hill Book Company, Inc., 1955 376 p illus 24 cm. $5 75 546

Contents (abridged) Whole numbers. Fractions and mixed numbers. Decimals. Systems of measure. Introduction to algebra. Ratio and proportion percents. Problems of the home. Powers and roots. Additional problems and formulas. Measures of central tendency—averages. Graphs. Geometry of form—of size. Geometric drawing and construction—geometry of position. Navigation and aeronautics. Algebraic language. Solution of equations. Variation and proportion. Trigonometry Positive and negative numbers. Fundamental operations in algebra. Logarithms. The oblique triangle. Appendix. Index.

Note A concise review of the basic principles and processes of mathematics at the high-school level. The book is written primarily for readers whose daily work requires proficiency in elementary mathematics and who must refresh their knowledge of the subject. Throughout the text, emphasis is placed on the practical application of mathematical skills to the solution of problems in wide variety of vocations. The arrangement of the material and the inclusion f answers problems and review exercises make the volume suitable for home-study purposes and for use as text in vocational schools.

SMITH, LLOYD P

Mathematical methods for scientists and engineers New York Prentice Hall Inc., 1953 453 p. illus 23 cm. (Prentice-Hall physics series Donald H. Menzel, editor) $10 00 547

Contents: Elements of function theory Differential calculus. Integral calculus. Space geometry *Line, surface, and multiple* integrals. Theory of functions of a complex variable. Residues and complex integration. Representation of functions by infinite series of functions. Application of functions f complex variable to potential and flow problems. Algebra of linear equations, transformations and quadratic forms. Vector and tensor analysis. Orthonormal function systems. Orthonormal functions with continuous spectrum. Integral equations. Variational methods. Elements of probability theory Index.

Note Because it is written for students preparing for careers in such fields as physics and engineering, few proofs are given in this book. On the other hand, the author has taken pains to define clearly the various concepts that are introduced and to describe the conditions which must be satisfied in making valid use of a given technique. The principal subject is mathematical functions, and it is noteworthy that differential equations are not covered. The final chapter on *probability theory* was written by Professor Mark Kac. The author is Chairman of the Department of Physics at Cornell University

SOKOLNIKOFF, IVAN STEPHEN

Tensor analysis theory and applications. New York John Wiley & Sons Inc., 1951 335 p. 24 cm. (Applied mathematics series edited by I S. Sokolnikoff) $6.00. 548

Contents: Linear vector spaces—matrices. Tensor theory. Geometry. Analytical mechanics. Relativistic mechanics. Mechanics of continuous media. Bibliography. Index.

Note: An introduction to tensor analysis written on the graduate level and slanted for those interested in the applications of the subject rather than in its theory. No special field of application is emphasized, however; and in the words of the author "Perhaps the best evidence of the remarkable effectiveness of the tensor apparatus in the study of K[illegible] is in the fact that it was possible to include, between the covers of one small volume, a large amount of the material that is of interest to mathematicians, physicists, and engineers." The treatment of relativistic mechanics is intentionally brief because the author felt no need to duplicate the contents of available books on relativity of which Bergmann, *An introduction to the theory of relativity*, New York, 1942 and Rainich, *Mathematics of relativity*, New York, 1950, are mentioned in the bibliography.

MATHEMATICAL MACHINES

BERKELEY EDMUND CALLIS AND LAWRENCE WAINWRIGHT

Computers their operation and applications. New York Reinhold Publishing Corporation, 1956 366 p. illus. 23 cm. $8.00. 549

Contents (abridged): Section I. Machines that handle information: Computers. Types of automatic computers. Section II. Automatic digital computing machines: Storing information and the memory unit. Calculating and the arithmetic unit. Programming and the control unit. Reliability—checking and maintenance. The advantages and disadvantages of an automatic digital computer. Section III. Automatic analog computing machines: The analog principle and its use. The essential elements. Analog and digital computers compared. Examples of analog computers. Error control. Future prospects. Section IV. Other types of automatic computing machines: Types of automatic computing machines that are not digital or analog computers. The components of automatic computing machines. Section [illegible] Miniature computers and their use in training: Training for automatic computers. Simon—its history and uses [illegible]. Section VI. Some large-scale automatic digital computers: Univac. IBM types 701, 702, 705 and 704. ERA type 1103. Section VII. Applications of automatic computing machines: What work can automatic computers do? Applications of automatic computing machines in business. Military applications. Applications of automatic computing machines in other fields. Recognizing areas where automatic computing machines may apply. Section VIII. Miscellaneous: References—books and other sources of information. Roster of organizations making automatic computing machines. Glossary of terms and expressions. Index.

Note: A broad nontechnical account of automatic computers. It explains their principles and elements, compares the chief types, furnishes descriptions of some outstanding examples, and describes applications. Also, it includes useful reference features, such as the bibliography, list of organizations, and glossary. Neither a book for general readers nor a treatise for scientists and engineers interested in the design of computers, it will be of interest to scientists and engineers who desire a general knowledge of computers, to executives and managers of business organizations who want to know whether to look into the applicability of electronic computers in business routines, and to writers who feel the need of more solid information than is contained in the popular books.

BERKELEY EDMUND CALLIS

Giant brains or machines that think. New York John Wiley & Sons, Inc., 1949 270 p. illus. 22 cm. $5.00 550

Contents: Can machines think? Languages. A machine that will think. Counting holes. Measuring: Accuracy to 23 digits. Speed—1,000 additions a second. Reliability—no wrong results. Remembering: [illegible]. The future. Social control. Supplement. Index.

Note: A well-written popular book. Not only does it explain the principles of such bewildering machines as Harvard's IBM Automatic Sequence-Controlled Calculator, The Electronic Numerical Integrator and Calculator (ENIAC) and the Kalin-Burkhart Logical-Truth Calculator, but it conveys the general idea of the principles of calculation by machine and of what may be accomplished by machine calculation and by related ideas such as [illegible] and translators. It is written for general reading, but it is not a superficial popularization. To grasp all of it, the lay reader will have to apply himself about as vigorously as in comprehending a text in elementary algebra. A useful feature for serious students and librarians is an extensive, organized bibliography.

DETURK J E. AND OTHERS

Basic circuitry of the MIDAC and MIDSAC. By J E. DeTurk H. L. Garner J Kaufman H W Bethel, R. E. Hock. The work reported herein was supported by the Boeing Airplane Company under the sponsorship of the U S Air Force. May 1954 1947–2–T Ann Arbor University of Michigan Press, 1954 96 p illus 28 cm. (University of Michigan. Engineering Research Institute. Special publications Monographs) $2.00 551

Contents: Description of computer plug-in circuits. Assembly of standard packages to obtain functional units. Example of a computer subsystem—a serial arithmetic unit. Mechanical design. Appendices: Rules and data for using packages. Some design factors and effects of component tolerances. References. Distribution.

Note: A product of a program set up to investigate the development of electronic computing circuits which could be standardized and used as building blocks for computer design. These circuits and their components constitute the "packages" mentioned in the above contents. The program was related to the design of the Michigan Digital Automatic Computer (MIDAC) and the Michigan Digital Special Automatic Computer (MIDSAC). Each of the computers mentioned "uses more than one thousand of these packages to implement all computer functions with the exception of the memory and input-output functions." The packages themselves, the mechanical details of their unit assemblies, their assembly on racks or other holders in the complete machine, and the method of cooling are diagrammed and described. The illustrations include some pictures made from photographs of assembled units.

ENGINEERING RESEARCH ASSOCIATES, INC.

High-speed computing devices. Supervised by C. B Tompkins and J H. Wakelin. Edited by W W Stifler jr New York McGraw Hill Book Company Inc., 1950 451 p. illus. 24 cm. $8.00. 552

Contents: Part I. The basic elements of machine computation: Introduction. Preliminary considerations. Counters as elementary components. Switches and gates. A functional approach to machine design. Arithmetic systems. Numerical analysis. Part II. Computing systems: Desk calculators. Punched-card computing systems. Large-scale digital computing systems. Analog computing systems. The form of a digital computer. Part III. Physical components and methods: Arithmetic elements. Transfer mediums. Data-conversion equipment. Special techniques and equipment for possible use in computing systems. Factors affecting choice of equipment. Index.

Note: A survey of the principles, chief components, and applications of mechanical and electronic computing machines. It is written largely from the viewpoint of engineers and scientists interested in these machines from the standpoint of design or applications. The concise final chapter on choosing computing equipment is of potential interest to business and laboratory executives. The book is well organized and well written. A fair amount of familiarity with technical and mathematical concepts is essential to understanding it, but it is by no means a specialist's book. It was prepared originally under an Office of Naval Research contract.

HARRIS, CHARLES OVERTON

Slide rule simplified. Chicago American Technical Society 1943 250 p. illus. 21 cm. $3.00. 553

Contents: How to hold a slide rule. The action of the rule. Multiplication. Division. Combination of multiplication and di-

vision. The square and square root. The cube and cube root. Sines and cosines. The tangent of the angle. The log scale. The reciprocal scale. How to check slide rule. Summary of rules for locating the decimal point and rules for fundamental operations of the rule. Negative numbers. Answers to practice problems. Index.

Note Eight chapters, intended for the beginner deal clearly and fully with the simpler types of calculation. Additional chapters are designed for more advanced students. The text is liberally supplied with practice problems, and the answers are furnished.

HARTKEMEIER, HARRY P

Punch-card methods, how to use and operate punching, sorting, electronic statistical, tabulating, and accounting machines, including types 24, 26, 75, 80, 82 101, 402, 403, and 407 Dubuque Wm C Brown Company, 1952 360 p illus 28 cm $5 00 554

Contents (abridged) The printing card punch, type 26. Sorting machines. Tabulating machines, types 402–403 The electronic statistical machine, type 101 The printing machine, type 407 Index.

Note A complementary book to the author's *Principles of punch-card machine operation*, New York, 1942 now out of print. It deals with the use and operation of punch-card machines put on the market since the earlier textbook was written. Specifically it covers the International Business Machines Corporation's machines of the types named in the subtitle. Machines introduced since 1952 are, of course, not covered. Although written for the instruction of scientists and statisticians who are interested in punch-card machines from the viewpoint of their usefulness in applied statistics rather than in such fields as accounting and bookkeeping, applications and potential applications in statistics and science are not discussed. All of the space is devoted to descriptions of mechanical features, techniques of operating, and wiring for particular kinds of operations.

HARTREE, DOUGLAS RAYNER

Calculating instruments and machines Urbana University of Illinois Press, 1949 138 p illus. 27 cm. $4 50 555

Contents Introduction. The differential analyser The differential analyser and partial differential equations. Some other instruments. Introduction to large automatic digital machines. Charles Babbage and the analytical engine. The first stage of development. Projects and prospects. High-speed automatic digital machines and numerical analysis. References. Name index. Subject index.

Note Not as general in scope as the title indicates, this book is nevertheless a useful introduction to present-day automatic calculators. Desk machines and conventional punch-card devices are not included, but the principles of analog machines and digital computers are explained clearly The operating principles of the Harvard Mark I Calculator and of the Eniac are described in some detail. The book originated as a series of lectures delivered at the University of Illinois in the fall of 1948 There is a bibliography of 122 references.

HARVARD UNIVERSITY COMPUTATION LABORATORY

Description of a magnetic drum calculator By the staff of the Computation Laboratory Cambridge, Mass. Harvard University Press, 1952 318 p illus 27 cm. (Harvard University Computation Laboratory Annals. Vol. XXV) $8 00 556

Contents Organization of the calculator Basic circuits. Storage system. Arithmetic units. The elementary functions. Numerical input and output devices. Sequencing and control. Instructional tape preparation table. Operation of the calculator Problem preparation and solution of typical examples. Appendixes. Constants in fast storage. List of codes. Index.

Note. Various aspects of the construction, theory and operation of an electronic digital calculator employing magnetic drums and magnetic tape for the storage of numerical and instructional information are discussed in this work. The book is a rather specific description of the Mark III Calculator built by Harvard University for the Bureau of Ordnance of the United States Navy However it is of general interest to mathematicians and other scientists who are interested in either the construction or applications of such machines. There are numerous illustrations.

HARVARD UNIVERSITY COMPUTATION LABORATORY

A manual of operation for the automatic sequence controlled calculator With a foreword by James Bryant Conant. Cambridge, Mass Harvard University Press, 1946 561 p illus. 27 cm (Harvard University Computation Laboratory Annals. Vol. I) o p. 557

Contents Historical introduction. Description of the calculator Electrical circuits. Coding. Plugging instructions. Solution of examples. Bibliography Introduction to the Appendices. Sequence codes. Sequence circuits. Register circuits. Multiply unit circuits. Divide unit circuits. Relay list. Cam list. Fuse list. Index.

Note The official manual was prepared and published not only for the benefit of the staff of the laboratory who operate the automatic sequence controlled calculator but also for scientists and engineers in general who are interested in studying the potential applications of this machine. The bibliography is an extensive but not exhaustive record of the international literature of numerical analysis.

HARVARD UNIVERSITY COMPUTATION LABORATORY

Proceedings of a second symposium on large-scale digital calculating machinery Jointly sponsored by the Navy Department Bureau of Ordnance and Harvard University at the Computation Laboratory, 13–16 September 1949 Cambridge, Mass Harvard University Press, 1951 393 p illus. 27 cm. (Harvard University Computation Laboratory Annals Vol 26) $8 00 558

Contents (abridged) The Mark III calculator by B L. Moore. The Bell computer Model VI, by E. G. Andrews. An electrostatic memory system, by J P Eckert, Jr The Raytheon electronic digital computer by R. M. Bloch. Semiautomatic instruction on the Zephyr by H. D Huskey Static magnetic delay lines, by W D Woo. Coördinate tubes for use with electrostatic storage tubes, by R. S. Julian and A. L. Samuel. Electrochemical computing elements, by J R. Bowman. Logical syntax and transformation rules, by G. W Patterson. Mathematical methods in large-scale computing units, by D H. Lehmer. Numerical methods associated with Laplace's equation, by W E. Milne. An iteration method for the solution of the eigenvalue problem of linear differential and integral operators, by C. Lanczos. On the Monte Carlo method, by S. M. Ulam. Double refraction of flow and the dimensions of large asymmetric molecules, by H. A. Scheraga and others. Computational problems in nuclear physics, by H. Feshbach. Computing machines in aeronautical research, by R. D O'Neal. A statistical method for certain nonlinear dynamical systems, by G. R. Stibitz. Combustion aerodynamics, by H. W Emmons. Application of computing machinery to research in the oil industry by M. Muskat. Application of computing machinery to the solution of problems of the social sciences, by F Mosteller Computational aspects of certain econometric problems, by H. Chernoff. The selectron, by J Rajchman. Traits caractéristiques de la calculatrice de la machine à calculer universelle de l'Institut Blaise Pascal, by L. Couffignal. The future of computing machinery by L. N Ridenour

Note. Altogether there are in this volume 39 original papers, classified under such headings as "Recent developments in computing machinery "Numerical methods, "Computational problems in physics, and "The economic and social sciences. The authors are scientists and technologists who are closely associated with progress in the field. Most of the papers are short, but practically all of them contain valuable information for persons who are interested in either the development or applications of high-speed computers.

HARVARD UNIVERSITY COMPUTATION LABORATORY

Synthesis of electronic computing and control circuits. Cambridge, Mass. Harvard Uni

versity Press, 1951 278 p. 24 cm. (Harvard University Computation Laboratory Annals. Vol. XXVII) $8.00 559

Contents: Introduction. Vacuum-tube operators. Switching functions of two and three variables. Switching functions of [illegible] variables. Minimizing charts. Pyramids and rectangles. Multiple-output circuits. Triggers, rings, and digit counters. Three variables. Rectifiers. Coding systems. Adders and accumulators. Multipliers. Appendix: Switching functions of four variables.

Note: In this work the design of electronic circuits for use in computing and controlling mechanisms is treated from the standpoint of fundamental principles. The treatment leans heavily upon algebra, and there are many more mathematical symbols than electronic symbols in the text. However, the main viewpoint is practical. The book will be of primary interest to physicists, mathematicians, and engineers interested in the design of electronic computers. Electrical engineers not working in this field, but whose work includes the design of circuits for industrial electronic equipment, will find it of interest.

HASTINGS CECIL, JR.

Approximations for digital computers. By Cecil Hastings Jr., assisted by Jeanne T Hayward and James P Wong Jr Princeton Princeton University Press, 1955 201 p. illus. 24 cm. $4.00 560

Contents (abridged): Part I, Concerning best fit. Linear weights. An iterative procedure. Solution of equations. Chebyshev polynomials. Concerning weights. Function with [illegible] peak. Rates of convergence. Choice of form. A [illegible] problem. Part II [Approximations for digital computers] References for Part II.

Note: An unusual book, the contents of which are already fairly well known among mathematicians who use high-speed computing machines. The author's own description of its subject reads: "This monograph deals with the subject of best approximation in the sense of Chebyshev as applied to the problem of making univariate functional data available to the high-speed digital computing machines. Our investigation is of [illegible] numerical and empirical nature." The author's method is recognized as both original and useful, and the book is potentially of interest not only to mathematicians but also to other scientists who are concerned with using high-speed computers in interpreting experimental data and testing hypotheses. The first part of the book is organized in the form of frames from film strip. Each frame is reproduced in the style of [illegible] diagram, and [illegible] brief explanation is printed under it. This part serves as an introduction to the problem of approximation. The second part reproduces in much the same style 78 sheets which [illegible] best approximations in loose-leaf form. These sheets contain the approximations and are designed for reference use.

JOHNSON CLARENCE L.

Analog computer techniques. New York McGraw Hill Book Company Inc. 1956 264 p. illus. 23 cm. $6.00 561

Contents: Introduction. The linear computer components. Time and amplitude-scale factors. The synthesis of servomechanism systems. Multiplying and resolving servos. Additional computer techniques. The representation of nonlinear phenomena. Multipliers and function generators. Miscellaneous applications of the electronic analog computer. Analog computer components and computer control. The checking of computer results. Repetitive analog computers. The digital integrating differential analyzer. Appendixes. Index.

Note: This book is an introduction to the principles and uses of electronic analog computers (differential analyzers). The author states that it is intended for computer operators. It should be equally useful to engineers concerned with problems that may be solved on analog computers. The historical development of this class of mathematical instrument and related background information are outlined in the first chapter. Most of the succeeding chapters deal with the elements of analog computers and their mathematical uses and potentialities. In these there are numerous circuit diagrams, worked examples, and selected literature references. The final chapter outlines the principles and the main techniques of operation of the digital integrating differential analyzer and supplies a selected list of literature references pertaining to it.

JOHNSON, LEE H.

The slide rule. Princeton D Van Nostrand Company Inc., 1949 242 p illus. 24 cm. $4.25 562

Contents: Introduction. Multiplication and division. Squares, square roots, cubes, and cube roots. The log log scales. Trigonometric scales. Special operations. The Polyphase and Mannheim slide rules. Table of conversion factors. Answers to problems. Index.

Note: A comparatively full discussion of the use of modern slide rules in the solution of engineering problems. Most of the material has to do with the Duplex rule but there is also [illegible] fair amount of material on the Mannheim and Polyphase slide rules. The author's purpose is to teach students and practicing engineers to use their rules rapidly and expertly. He stresses correct handling of the rule, and describes in detail its manipulation in [illegible] variety of problems. There are 118 figures, and many of these consist of several illustrations.

JOINT ACM–AIEE–IRE COMPUTER CONFERENCE

Proceedings of the Western Joint Computer Conference papers presented at the Joint ACM–AIEE–IRE Computer Conference, San Francisco Calif., February 7–9, 1956 Sponsors The American Institute of Electrical Engineers, Committee on Computing Devices The Association for Computing Machinery The Institute of Radio Engineers, Professional Group on Electronic Computers. New York Published by the American Institute of Electrical Engineers for the Joint Computer Committee 1956. 142 p. illus. 28 cm. $3.00 563

Contents (abridged): Programming and coding. Auxiliary equipment. Machine design. Systems. Design, programming, and coding. Scientific application. Applications. Circuits. RCA BIZMAC system.

Note: The 24 papers presented at the sixth Joint Computer Conference are published in this volume. They are organized under the headings given above [illegible] which serve to indicate the scope of the conference and the papers. The authors are in the forefront of computer development and application, and [illegible] number of new developments are described in the papers.

KORN GRANINO A., AND THERESA M KORN

Electronic analog computers (D-c analog computers) Second edition. New York McGraw Hill Book Company Inc., 1956. 452 p. illus. 23 cm. $7.50 564

Contents: Introduction to D-c analog computers. Practical setup for practical problems. Theory and design of linear computing elements—Coefficient setting potentiometers and operational amplifiers. D-c amplifiers for computer applications. Multipliers and function generators. Auxiliary circuits and computer operation. The design of complete D-c analog-computer installations. Tables of special computer setups. Bibliography (to 1950) Bibliography (since 1950) Examples of differential analyzer computations. Author index. Subject index.

Note: A full-scale treatment that covers principles, uses and design of d-c analog computers. Though introductory in the sense that no previous acquaintance with these instruments is assumed, the field is covered thoroughly enough to make the book useful to scientists and engineers interested in it, either from the viewpoint of applications or design. Somewhat more attention is paid to design than to applications, however, the setting up of problems for solution on analog computers is adequately explained. The first edition was published in 1952. A fair amount of material, including information on new developments in applications and new developments in design, has been added in this second edition. A new bibliography covering literature published since 1950 down to some unspecified date in 1956 now supplements the original bibliography carried over from the first edition.

RICHARDS R. K.

Arithmetic operations in digital computers. Princeton D Van Nostrand Company Inc., 1955 397 p illus. 24 cm. $7.50 565

Contents: Symbolic representation of quantities. Boolean algebra applied to computer components. Switching networks. Binary add.

tion and subtraction. Binary multiplication and division. Decimal codes. Counting, binary and decimal. Decimal addition and subtraction. Decimal multiplication and division. Miscellaneous operations. Computer organization and control. Programming. Bibliography. Index.

Note. Developed under the auspices of the International Business Machines Corporation and used as a text in courses given by that organization to its beginning engineers, this book is a professional-level introduction to the use of digital computers. As the title indicates, the emphasis is on how arithmetic operations, such as addition, subtraction and division, are carried out on this class of computing machines. Both computations which can be represented by whole numbers and those involving decimals are explained in rather thorough detail. In the course of the exposition of these matters, frequent references are made to computer elements and their functions. In addition, there is a 40-page chapter on computer elements, their uses and interrelations. The bibliography is a selected one of books, periodicals and papers. An especially useful feature of it is the inclusion of references to literature on individual computers; for instance three references to papers on the "Whirlwind I" computer are listed.

SOROKA, WALTER W

Analog methods in computation and simulation New York McGraw Hill Book Company, Inc., 1954 390 p illus. 23 cm $7 50 566

Contents: Mechanical computing elements. Electromechanical, electrical, and electronic computing elements. Machines for simultaneous linear algebraic equations. Analog solution of nonlinear algebraic equations. The mechanical differential analyzer. Electronic analog computers (electronic differential analyzers). Dynamical analogies. Equivalent circuits for ordinary and partial differential equations in finite differences. Membrane and conducting-sheet analogies. Author index. Subject index.

Note. The main theme of this book is the use of analogs in engineering analysis and computations, the criteria for analogy being whether the operation of a familiar system and of the unfamiliar system to be studied can be expressed by similar differential or algebraic equations. Necessarily, however, much space is devoted to mechanisms. The elements of computing devices or systems are described in the first two chapters. Later chapters are devoted largely to the uses of these elements, and especially to combinations of them in dealing with specific types of problems in engineering analysis. Throughout, there is more emphasis on the properties of systems and on the mathematical applications than on mechanical and electrical details. The author is Professor of Engineering Design in the University of California, and the book is designed for use as a text by advanced engineering students. It is of interest also to graduate engineers and applied mathematicians.

THOMPSON, J E

The standard manual of the slide rule, its history, principle and operation. Second edition Princeton D Van Nostrand Company, Inc., 1952 216 p illus. 22 cm. $3 25 567

Contents. History of the slide rule. Theory and operation of the Mannheim slide rule. Modified forms of the Mannheim rule and their use. Typical problems and slide rule settings. Exercises and answers.

Note. In this long-established book, instructions are given in simple language for the use of all standard forms of the slide rule. The history of the slide rule is outlined as background material. Numerous worked examples are included in the other chapters, and a varied selection of exercises and problems, with the answers given, is included for the reader. The book is well suited to use as a self-instruction guide.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Computer development (SEAC and DYSEAC) at the National Bureau of Standards, Washington, D C. Washington, D C Government Printing Office, 1955 146 p. illus. 27 cm (United States National Bureau of Standards Circular 551) $2 00 568

Contents: Introduction by S. N Alexander. SEAC, by S. Greenwald and others. Dynamic circuitry techniques used in SEAC and DYSEAC, by R. D Elbourn and R. P Witt. DYSEAC, by A. L. Leiner and others. System design of the SEAC and DYSEAC, by A. L. Leiner and others. High-speed memory development at the National Bureau of Standards, by R. J Slutz and others. Input output devices for NBS computers, by J L. Pike and E. F Ainsworth. Operational experience with SEAC, by J. H. Wright and others. SEAC—review of three years of operation by P. D. Shupe, Jr., and R. A. Kirsch.

Note. The first major contribution of the NBS to the development of electronic computing machinery came with the completion of the SEAC (Standard Eastern Automatic Computer) in May 1950. This circular tells of the historical development and the accomplishments to date of the SEAC and of the newer computer the DYSEAC. Development, design, construction, and maintenance of computer equipment are covered.

ASTRONOMY

GENERAL

ABBOT CHARLES GREELEY

The earth and the stars. Second edition. New York D Van Nostrand Company Inc., 1946. 288 p. illus. 24 cm. $5 75 569

Contents: Part I. The mighty universe. The heavenly bodies and their greatest enigma. The constellations. Numbering the stars. How far away are the stars? Motions of the heavenly bodies. What are the stars? Variable stars. Origin and future of the stars. Part II. Interesting astronomically related subjects. Atoms, spectra, and star radiations. The sun's family, the solar system. Our earth, and her neighbor the moon. Our star, the sun. The features of the sun and solar eclipses. Heat, weather, power and life from sun rays. The calendar, star places, and navigation. Some famous astronomers and famous instruments. Appendices. Index.

Note. One of the better examples of popularized scientific writing. Astronomy and the methods of astronomers are made fascinating for the intelligent general reader by judicious selection of topics and an avoidance of abstruse terminology rather than by devious "writing down."

ALTER, DINSMORE, AND CLARENCE H. CLEMINSHAW

Pictorial astronomy With recent advances. New York Thomas Y Crowell Company 1956 310 p. illus. 27 cm. $5 95 570

Contents (abridged): Section I. The sun. Section II. The earth. Section III. The moon. Section IV. Eclipses. Section V. The planets. Section VI. Comets and meteors. Section VII. Stars and nebulae. Section VIII. Miscellaneous. Revised and new data. Index.

Note. An outstanding popular introduction to astronomy written by the Director and Associate Director of the Griffith Observatory and based partly on articles which have been published in the *Griffith Observer.* Although illustrations are a feature, the volume is not primarily a collection of pictures, as the title might be taken to indicate. There is a considerable amount of informative text which is written in clear style. This text is supplemented by graphs and other line drawings printed on the text pages, and more than 30 plates. Most of the plates contain more than one illustration. The eighth section contains a chapter entitled "Recent astronomical advances," describing such new developments as radio astronomy.

BERNHARD HUBERT JAY AND OTHERS

New handbook of the heavens by Hubert J Bernhard, Dorothy A. Bennett, and Hugh S. Rice. Revised edition. New York Mc Graw Hill Book Company Inc., 1948 360 p illus. 21 cm. $4 95 571

Contents: Introduction to the heavens. Stars around the poles. Autumn and winter stars. Spring and summer skies. Stars of the southern sky. The planets. The moon. The sun. The comets. The meteors. The asteroids. Double and multiple stars. Variable stars. Star clusters and nebulae. Rainbows, aurorae, and other wonders. Units of the universe. Solar time. The art of navigation. Photography of the heavens. Use of the telescope. Astronomy for the traveler. Appendices. Glossary. Index.

Note. One of the better introductions to astronomy for young people and amateur astronomers. It is written in a clear, interesting style and is generously illustrated with diagrams and photographs. New in this edition, whose other chapters have been but very slightly revised, are the chapters on solar time, the art of navigation, and astronomy for the traveler. Five of the [illegible] appendices are newly added.

BOK BART JAN AND PRISCILLA F BOK

The Milky Way Second edition. Cambridge, Mass. Harvard University Press, 1945 224 p illus. 22 cm. (The Harvard books on astronomy edited by H. Shapley and B J Bok) 572

Contents: Presenting the Milky Way. How an astronomer attacks the problem. The sun's nearest neighbors. Reaching out—the system takes shape. The whirling galaxy. Bright and dark nebulae. The interstellar gas. The general haze. Men at work. Explorations in space. How old is the Milky Way? Postscript. Index.

Note: A semi-popular account of present-day knowledge regarding the Milky Way and of the methods and instruments which have made this knowledge possible. The dust and gas in the vast spaces between the stars, the compositions and dimensions of star clusters, and the problems related to the past and future of our galaxy are discussed. Among the many illustrations are two large-scale photographic maps of the Milky Way, second photographs made with Schmidt cameras, and portraits of the leading scientists in the field. A third edition, 269 p., $5.50, was published in 1957.

FROST GEORGE EDWIN

Planets stars and atoms. Caldwell, Idaho The Caxton Printers, Ltd. 1939 287 p illus. 23 cm. $3 75 573

Contents: Introductory. The universe. The telescope. The spectroscope. Photography. Our solar system. The sun. Mercury. Venus. The earth. The moon. The tides. Mars. Minor planets. Jupiter. Saturn. Uranus. Neptune. Pluto. Comets. The stars. The Milky Way. Distant nebulae. External galaxies. Space. Theory of the universe as an enclosed sphere. Do other planets exist? The microscopic universe. Molecules. Atoms. Matter and energy. Ether, empty space and gravitation. The theory of relativity. Radiation. Light. Color. Sound. Universal motion. Other worlds. The sky maps. Appendix: definitions and facts for handy reference. Index.

Note: A summary of the rudiments of astronomy and related sciences, intended as a handy reference book for the use of teachers of elementary schools, as well as a semi-popular account for the layman. Included are six maps of the northern sky for the months of January, March, May, July, September, and November, plus a glossary of facts and terms for readers not generally familiar with scientific terminology. There are 34 photographs and drawings.

HARVARD UNIVERSITY OBSERVATORY

Centennial symposia. December 1946 Cambridge Mass. Published by the Observatory 1948 385 p. illus. 23 cm. (Harvard Observatory monographs. No. 7) $5 00 574

Contents: Preface, by Harlow Shapley. I. Symposium on interstellar matter: Interstellar absorption in our own and other galaxies, by J. Stebbins. Color effects in reflection nebulae, by C. Schalén. Lines in diffuse nebulae, by J. L. Greenstein. Surface photometry of line emission in nebulosities, by J. G. Baker. Dimensions and masses of dark nebulae, by B. J. Bok. Evolution and physics of solid particles, by H. C. van de Hulst. The formation of cosmic clouds, by L. Spitzer Jr. Kinetics of cosmic clouds, by F. L. Whipple. II. Symposium on electronic and computational devices of interest to astronomers. The adaptation of photoelectric devices to the properties of the electron, by D. E. Kerr. Infrared detectors and their astronomical applications, by A. E. Whitford. Electronic and electromagnetic measuring, computing and recording devices, by W. J. Eckert. III. Symposium on eclipsing variables: The royal road of eclipses, by H. N. Russell. Spectrographic studies of eclipsing binaries, by O. Struve. The spectrophotometric determination of relative luminosities of components in two-spectra binary systems,

by E. M. Petrie. The relative frequency of low luminosity eclipsing binaries, by H. Shapley Some unsolved problems in the theory of eclipsing variables, by Z. Kopal. IV Symposium on the gaseous envelope of the earth: The solar corona and ultraviolet radiation by L. Goldberg and D H. Menzel. The sun and conditions in the upper atmosphere, by F L. Whipple. Solar activity the ozone layer and the lower atmosphere, by B Haurwitz. Solar activity and the general circulation of the lower atmosphere, by H. C. Willett. Index.

Note A collection of papers which were presented at four symposia held in honor of Harvard University's 100th year of active astronomical research. The symposia were held under the auspices of the American Astronomical Society Most of the papers were written by professional astronomers, and they are addressed to graduate workers in the science. They are accompanied by short lists of pertinent literature, and there is a general index to the entire volume.

Lee Oliver Justin

Measuring our universe, from the inner atom to outer space New York The Ronald Press Company 1950 170 p illus 22 cm. $3 25 575

Contents The romance of distances. How our units of distance developed. Precision measuring machines. The magic of light waves. Man lives by parallax. Distance to the sun—yardstick of the gods. Our little solar system. Accuracy is like the flavor of exotic wines. Private interviews with stars. Spectra yield the distances of stars. Michelson plays with light. Cepheid variables tell more secrets. The giant reflector of Palomar: the Hale telescope. Thinking it over Appendix. Index.

Note In this interesting book the author tells how units of measurement were evolved, conveys an idea of the importance of precision measurement, and describes the techniques that are used by scientists in making precise measurements. Most of his text pertains to measurement in astronomy but the book has appeal beyond the areas of this field. Lay readers of science should find it interesting, whether or not they are interested in astronomy The book replaces the author's *Beyond yonder* Boston 1930 and it contains much material not in that work.

Makemson, Maud (Worcester)

The morning star rises an account of Polynesian astronomy Published for Vassar College. New Haven Yale University Press, 1941 301 p illus 23 cm $5 00 576

Content List of illustrations. Foreword. Stars of the sea road. The origin of heaven and earth. The cycles of the stars and moon. Omens in the sky Myths of the sun and moon. The sky children. Stars of the south seas. The astronomical school. Table I, Identification of stars and constellations. Table II, Names of months. Bibliography Index.

Note This is an investigation of the astronomical practices, knowledge and beliefs of the Polynesians as expressed in their method of navigation calendrical system, ideas on cosmogony and myths of the sun, moon, and stars.

Mayall, Robert Newton, and Margaret L Mayall

Skyshooting hunting the stars with your camera. New York The Ronald Press Company 1949 174 p illus. 24 cm $4 00 577

Content Looking it over Star trails. Aurorae. Meteors. Stars. Variable stars—new stars—comets. Clusters and nebulae. The sun. The moon. The planets. *Fun for the family* Plates and films, developing, printing, enlarging. Sidereal (star) time. Mountings with mechanical drives. How to use the setting circles. Keeping records. Appendix. The library Index.

Note An excellent book on a subject which has seldom been treated from the standpoint of amateur photographers or astronomers. Considerable point is made of the fact that expensive photographic equipment is not essential. Only about 15 pages are devoted to discussions of cameras, film, and related photographic apparatus. The remainder of the book deals with the categories of astronomical objects which are available for photographing, and with the simpler techniques of star photography which are within the reach of most amateurs. The junior author is on the staff of the Harvard College Observatory

Olcott, William Tyler

Olcott's Field book of the skies. Revised by R. Newton Mayall and Margaret W Mayall. Fourth edition. New York G P Putnam s Sons, 1954 482 p illus 18 cm. $5.00 578

Content Why study astronomy? Fundamentals. How do we know? How to use this book. The constellations—of spring—of summer—of autumn—of winter The solar system. The Milky Way The small telescope. Historical events. The names of the stars and their meanings. Appendices. Index.

Note An elementary reference book designed particularly for the information and guidance of beginners and amateurs who are interested in the identification and observation of the planets and visible stars and in having a general basic knowledge of astronomy It is small enough to be carried conveniently in the field during observations. Considerable space is given to the sky charts and diagrams of the constellations and the face of the moon. Sky charts and constellation diagrams are based on Latitude 40 N for the four seasons of the year Separate diagrams are provided for observations with the unaided eye or field glass and for observations with a small telescope. A chronological table of developments in astronomy information on mythology of the heavenly bodies, and a list of variable stars are among the miscellaneous reference information included. The third edition was published in 1938. In this fourth edition, among other changes, the pages numbered "401A–405P" in the third edition have been deleted, the chronology has been carried through 1953 and diagrams have been re-drawn.

Pfeiffer, John

The changing universe, the story of the new astronomy New York Random House, 1956 243 p illus 23 cm. $4 75 579

Contents Broadcasts from space. Exploring the radio sky Tuning in on the stars. Listening to the solar system. The sun in action. Among the constellations. Beyond the Milky Way Mapping new skies. Mysterious signals. Raw material of the universe. Exploring our galaxy Inside the spiral arms. Radio astronomy The future. Index.

Note A well-written survey of radio astronomy for lay readers. Both the techniques and the potentialities of this new branch of astronomy are described. The author is an eminent science journalist, and the book is an outstanding example of popular yet authoritative science writing. It is based on interviews and correspondence with professional astronomers and visits to astronomical observatories, as well as the published literature. Unfortunately it contains no literature references or guides for persons whose interest in the subject is aroused to the point where they wish to read further

Pickering James Sayre

The stars are yours Revised edition New York The Macmillan Company 1953 298 p illus 21 cm. $3 95 580

Note A miscellany of information regarding the sun, planets, and other units of our solar system, and the stars. It is addressed to laymen and amateurs who are beginning the study of astronomy The greater part of the volume consists of 15 charts of those stars of the northern hemisphere which are visible to the naked eye. Each chart is accompanied by descriptions of the size and position of the constellations and the stars represented in them and an indication of the dates when they may be most readily observed. The appendix contains such information as the meanings of star names, tabulation of star magnitudes, a survey of the constellations of the southern skies, and a bibliography of books for further reading. The first edition was published in 1948

Rufus Will Carl, and Hsing-Chih Tien

The Soochow astronomical chart. Ann Arbor University of Michigan Press 1945 24 p illus. 29 × 28 cm. (obl) $5 00 581

Contents Introduction. Translation of the text. The star map. Tables I–IX, with translations and explanations.

Note The chart named in the title of this book is one of several stone engravings made in the 13th century in the Wen Miao temple (Confucian Temple of Literati) near Soochow Kiangsu, China. In

this volume, the chart and the accompanying text are reproduced from rubbings; translation of the text is given; and there is discussion of the star map, which is shown to have been devised for astrological rather than astronomical purposes.

STERNE MABEL

Directory of the astronomical observatories in the United States. Ann Arbor J W Edwards, 1947 162 p. illus. 21½ cm. $3.00. 582

Contents: Observatories other than those of astronomical societies. Observatories of astronomical societies. Addenda. Geographical list (index). Observatories of the near future.

Note: For each observatory college, university, group-owned, or private, the compiler gives the name, location, and ownership, plus brief statement, where possible, describing the equipment used, the type of housing, date of construction, and the principal uses of the observatory. Photographs of many of the observatories are included. The book is intended for both professional and amateur astronomers. A list of principal sources from which the compilation was derived is provided.

UNITED STATES. NAVAL OBSERVATORY NAUTICAL ALMANAC OFFICE

The American ephemeris and nautical almanac for the year 1958. Washington, D C. Government Printing Office 1956 593 p. 26 cm. $4.00. 583

Contents (abridged): Introduction. Calendar. Amplitudes and latitudes. Chronological eras and cycles. Astronomical constants. Sun, moon, planets. Stars. Eclipses and occultations. Physical ephemerides. Satellites. Miscellaneous tables. On the arrangement and use of *The American ephemeris and nautical almanac*. General index.

Note: As official compilations issued annually and comparable in scope and purpose to nautical almanacs issued by other leading nations of the world. The data presented are useful in navigation, survey astronomy etc.

WHIPPLE FRED L. editor

New horizons in astronomy Washington, D C. Government Printing Office 1956 181 p. illus. 26 cm. (Smithsonian Institution. Smithsonian contributions to astrophysics. Vol. 1 no. 1) $1.50 584

Contents: Techniques and instrumentation Optics, by J. S. Bowen. Solar instrumentation, by J W Evans and R. B. Dunn. Astronomical seeing and scintillation, by G. Keller. Spectroscopy by C. E. Moore. Radial velocities, by R. M. Petrie. Astrometry by K. A Strand. Photoelectric astronomy by A. E. Whitford. Interferometers in radio astronomy by B. F Burke and M. A. Tuve. Related sciences. Rocketry by R. Tousey. Computing machines in astronomy, by P Herget. Turbulence, by S. Chandrasekhar. Astroballistics, by R. N. Thomas. Electrodynamics of fluids and plasmas, by M. Krook. Hydromagnetic and plasma problems, by E. N. Parker. Solar system. Earth's magnetism, by W. M. Elsasser. Time, by W. Markowitz. Geographical positions, by J. A. O'Keefe. Celestial mechanics, by G. M. Clemence. Meteorites, by J. S. Rinehart. Meteors, by F. L. Whipple. Minor planets, by P Herget. Planets, satellites, and comets, by G. P. Kuiper. Airglow and aurora, by A B Meinel. Solar-terrestrial relationships: weather and communications, by W O Roberts. Solar physics, by L. Goldberg and D. H. Menzel. Stars and the galaxy. Spectral classification, by W. W. Morgan. Stellar atmospheres, by M. H. Wrubel. Aerodynamic problems in stellar atmospheres, by R. N. Thomas. Emission nebulae, by L. H. Aller. Double and multiple stars, by O Struve. Stellar dynamics, by D Van Woerkom. Variable stars, by C. Payne-Gaposchkin. Interstellar matter, by L. Spitzer, Jr. Hi astronomy research, by R. J. Bok. Some observational problems in galactic structure, by H. Weaver. Galactic clusters and associations, by A. Blaauw. Globular clusters observed through ... crystal ball, by W. A. Baum. Stellar structure and evolution, by M. Schwarzschild. Radio sources, by J. D. Kraus.

Note: A series of papers on the results of recent astronomical research published with two purposes in view: to provide material that might assist the National Science Foundation to support the research most likely to be productive; to help younger astronomers choose the most fertile fields for active research; to encourage established astronomers to pause and reflect on the most [illegible] progress in their own fields of research and to supply them with broader insight into the activities in other fields of astronomy possibly related to their own; and to encourage research in new or neglected fields of astronomy, particularly those that border on other areas of physical science such as geophysics, chemistry and fluid dynamics. The papers are accompanied by brief lists of references.

TEXTBOOKS

BAKER, ROBERT H

Astronomy a textbook for university and college students. Sixth edition. New York D Van Nostrand Company Inc., 1955 528 p. illus 24 cm $6.25 585

Contents: Introduction. Aspects of the sky. The earth in motion. Time and its uses. Light and the telescope. The moon. Eclipses of the moon and sun. The solar system. The other planets. The solar system. The sun. The stars. Variable stars. Binary stars. Stellar atmospheres and interiors. Star clusters. Interstellar dust and gas. The galactic system. The exterior systems. Reference books. Index.

Note: A standard textbook, the first edition of which was published in 1930 and the fifth edition in 1950. It is used primarily in introductory courses in colleges, and only an elementary knowledge of physics and mathematics is required for comprehension of it. Although the purpose, scope, and arrangement of this sixth edition are essentially the same as in recent previous editions, important revisions have been made in many of the chapters. These cover not only such relatively new developments as radio astronomy but also the revisions in the dimensions of the universe and other astronomical values made necessary by recent advances based on such new instruments as the 200-inch Hale telescope and the radio telescope. A few recent books have been added to the selected bibliography.

DUNCAN JOHN CHARLES

Astronomy a textbook. Fifth edition. New York Harper & Brothers, 1955 500 p. illus. (part col'd) 24 cm. $6.00 586

Contents: Introduction. The celestial sphere. Optics of the telescope. The earth and the sky. Celestial navigation. The orbital motion of the earth. The moon. Eclipses of the sun and moon. Spectroscopy. The sun. The scale of the planets. The law of gravitation. The planets. Meteors and comets. Theories of the evolution of the solar system. The stars—their classification, distances, and brightness. The motions of the stars. Physics of the stars. Stars of varying brightness. Star clusters and nebulae. The galactic system. Beyond the Milky Way. Tables. Index.

Note: Used in its various editions for more than 40 years as a textbook in college courses, this work provides a broad and informative introduction to descriptive astronomy. It conveys the principal scientific facts on the topics in astronomy named in the chapter titles listed above. In addition, the types of telescopes and their scientific principles are explained. The style in which it is written assumes on the part of the reader some acquaintance with basic physics and enough scientific maturity to enable the comprehension of a text in which technical terms are used freely. The little mathematics is elementary. The tables collected at the end of the volume contain basic data on such matters as the orbits of the planets; characteristics of the sun, moon, and planets; wave-lengths of spectral lines; and the brightest stars. The fourth edition was published in 1944. In this fifth edition the organization and scope are unchanged, but information has been added on such topics as radio astronomy.

FATH EDWARD ARTHUR

The elements of astronomy a nonmathematical textbook for use as an introduction to the subject in colleges, universities, etc., and for the general reader. Fifth edition. New York McGraw Hill Book Company Inc., 1955 369 p illus. 24 cm. $5.50 587

Contents: Introduction. The celestial sphere. The earth. Light. The telescope. The moon. Problems in practical astronomy—the calendar. Gravitational astronomy. The sun—our nearest star. Eclipses. The planetary system. The terrestrial planets and asteroids.

The major planets. Comets and meteors. The stars. Number and arrangement of the stars. Other members of the galactic system. Interstellar matter Structure of the galaxy Other galaxies. The structure of the visible universe. Cosmogony—a study of the origins. Appendix. Name index. Subject index. Star charts.

Note This book has been used for many years as an introductory text in colleges and as a reading and reference book for laymen. It covers in an interesting and lucid style a wide sweep of facts about astronomy Not all the facts presented are simple ones for instance, there is considerable discussion of the motion of the stars however all are discussed without resort to mathematics and in such a way that most readers will have little difficulty in understanding what the author says. The fourth edition was published in 1944 In this fifth edition the book has been given a new and more attractive format there are a new chapter many new illustrations, and very extensive revisions of several of the carried-over chapters.

Fisher, George Clyde, and Marian Lockwood

Astronomy New York John Wiley & Sons Inc., 1940 205 p illus 22 cm (The sciences a survey course for colleges edited by Gerald Wendt) $3 75 588

Contents The earth and the sky The moon. The sun. The other planets. Comets and meteors. Astronomical instruments. The stars. Variable stars, double stars, and clusters. Our Milky Way and other galaxies. The constellations. Bibliography Glossary Index.

Note A short informative survey of the earth as an astronomical body of the solar system and the relations of its members to each other and their places in the universe. The moon, sun, planets, comets, meteors, stars, and galaxies are all treated in easy informal style together with their motions and celestial events. Astronomical terms are defined in simple language Astronomical instruments are described to show their function in establishing facts. The book is understandable to the layman and gives him familiarity with the sky as well as an understanding of the structure of the universe.

Herget, Paul

The computation of orbits Cincinnati The author, 1948 177 p illus 28 cm $6 25 589

Content Introduction The calculus of finite differences. Problems in spherical astronomy The problem of two bodies. The method of Laplace. The methods of Gauss and Olbers. Improvement of the orbit. Special perturbations. Hansen method of general perturbations. Tables. Index.

Note Although designed as an introductory textbook, this work provides a detailed presentation of modern methods for the computation of orbits, especially the orbits of minor planets and, in addition seven useful tables, hich include an optimum interval" table which gives $1/r^3$ with the argument r^2 and has been made for use with calculating machine. In fact, throughout the book the uthor has assumed that the computations will be largely carried out on a calculating machine of the desk type. Readers are presumed to have had courses in differential and integral calculus. The chapter on the calculus of finite differences is introductory The uthor is Professor of Astronomy in the U iversity of Cincinnati and director of the Cincinnati Observatory

Kroogdahl Wasley Sven

The astronomical universe an introductory text in college astronomy New York The Macmillan Company 1952 599 p illus 24 cm $6 50 590

Content Introduction Part I, The solar system How the system behaves. Earth and sky The moon. The planets. The lesser bodies of the solar system. Part II, The anatomy of star The sun. Part III The stellar population How do we know? The vital statistics of the normal stars. The peculiar stars. Part IV The organization of the universe The Milky Way galaxy All else. Part V The evolution of the universe Beginnings and endings. Appendixes The constellations. The magnitude system. Telescopes and observatories. Bibliography Index. Star maps.

Note A textbook designed chiefly for college students who take a course in astronomy for its cultural rather than professional value. As might be expected, it contains no advanced mathematics. In fact, little mathematics of any kind. Nevertheless the author has succeeded well in describing the general content of astronomy showing how astronomers arrive at their principal deductions, and in conveying a picture of the nature and complexities of the universe. The 275 illustrations include reproductions of some remarkable photographs taken at the Mt. Wilson-Palomar Observatory and other observatories.

Payne Gaposchkin, Cecilia

Introduction to astronomy Englewood Cliffs N J Prentice Hall, Inc., 1954 508 p. illus 23 cm (Prentice Hall physics series Donald H Menzel, editor) $6 75 591

Contents Introduction—the dawn of astronomy The earth. Tools and methods. The sun. The moon. Eclipses and tides. The solar system. The planets. The lesser bodies of the solar system. Evolution of the solar system. Introduction to stellar astronomy Stars—geometrical properties. Physics of the stars. Variable stars. Stellar groups. Stellar systems. Systems of galaxies. Evolution. Appendixes Physical constants and units employed. The constellations. Problems. Index.

Note A well-written descriptive introduction to astronomy It is directed to lay readers and to college students making their first and possibly only contact with the subject. Although it is an "easy" text, it is packed ith information. There is somewhat more emphasis on the stars and somewhat less on the earth and solar system than in some cultural-type textbooks. There is an abundance of illustrations, but no literature references.

Russell, Henry Norris, and others

Astronomy a revision of Young's Manual of astronomy By Henry Norris Russell Raymond Smith Dugan, and John Quincy Stewart. Boston Ginn and Company, 1945–55 2 v illus. (part col d) 23 cm $6 00 per vol. 592

Content Volume I. The solar system Astronomical systems of measurement. Astronomical instruments. Problems of practical astronomy The earth as an astronomical body The orbital motion of the earth. The moon. The sun. Eclipses. The planets in general. Celestial mechanics. The terrestrial and minor planets. The major planets. Comets and meteors origin of the solar system. Appendix Numerical data. Index to names. Index to subjects. Volume II, Astrophysics and stellar astronomy The analysis of light. The solar spectrum. The sun's light and heat. Atomic theory and astrophysics. The stars. The motions of the stars. Double stars. The luminosities, temperatures, and diameters of the stars. Variable stars. Star clusters and the Milky Way The nebulae The constitution of the stars. The evolution of the stars. Supplement. Appendix. Name index. Subject index.

Note For many years standard textbook for college courses, although now out of date in part. It presents in lucid style a broad and fairly detailed view of accumulated knowledge, instruments and techniques before recent developments such as radio astronomy The revision of the first volume, published in 1945 was carefully done. Although the second volume bears 1955 copyright date this represents renewal of the original copyright. The latest revision of the second volume was published in 1938 even the new information was not incorporated in the text but, for the most part, was presented in supplementary pages

Skilling, William Thompson, and Robert S Richardson

Astronomy Revised edition New York Henry Holt and Company 1947 692 p illus (part col d) 22 cm. $6 50 593

Contents The purpose of astronomy The earth in astronomy Locating stars on the celestial sphere. Time and the calendar Celestial navigation. The astronomer's equipment and its use The solar system. The moon. Eclipses of the un and moon The tides. Light, atoms, and spectrum lines. The sun considered as star The terrestrial planets. The major planets. Comets and meteorites Star distances. Differences among the stars. The real motions of stars. The source of stellar energy Galactic nebulae and other interstellar material. Galaxies. Appendix Index Star maps.

Note A well-written and straightforward introduction to the elements of astronomy prepared for first-year college courses in

the subject whose purpose is cultural rather than technical. The extensive rearrangement and rewriting of much of the material in this edition is based on recommendations of teachers who have used the book. New chapters discussing the purpose of astronomy and the methods of celestial navigation have been included, the sections dealing with the physical nature of the sun and planets and the source of stellar energy have been expanded, and several star maps have been added.

TRUMPLER, ROBERT J AND HAROLD F WEAVER

Statistical astronomy Berkeley University of California Press, 1953 644 p. illus. 26 cm. $7.50 594

Contents (abridged) Part I: Elements of statistical theory. Univariate distributions. Bivariate and multivariate frequency functions. Integral equations of statistics. General theory of samples. Estimation of statistical parameters. Testing hypotheses. Part II. Statistical description of the galactic system—general analysis. Observational data. Partial solutions of the galactic distribution problem. Part III. Stellar motions in the vicinity of the sun. Sample population and co-ordinate systems. Principal hypotheses concerning local velocity distribution. Studies based on space velocities. Analysis of radial velocity data. Analysis of proper motion data. Statistical determination of stellar distances from proper motions and radial velocity data. Part IV. Luminosity—spectral type distribution. General studies of stellar populations. Luminosity law in the vicinity of the sun. Luminosity—spectral type distribution in the vicinity of the sun. Part V. Space distribution of stars. Determination of the space density law when interstellar light extinction is neglected. Extinction of light in interstellar space. Analysis of star counts according to apparent magnitude when interstellar extinction is present. Studies of the space distribution of stars based on magnitudes, spectral types, and color indices. Part VI. Galactic rotation. Differential effects of galactic rotation. Peculiar motions of stars in the solar neighborhood. Appendix: Tables A1—A10. Index of names. Index of subjects.

Note The first part of this work—which accounts for approximately one-third of the book's total length—is essentially an introduction to statistics for students who are preparing for careers in astronomy. The remaining parts illustrate the application of statistical techniques to the study of the structure, constitution, and dynamics of our galactic star system. In these parts, the data available in star catalogues and other publications for statistical analysis are indicated, and the applications of statistical techniques to various kinds of star studies are explained, with numerous specific examples worked out in detail. Helpful annotated bibliographies are included at each section. The authors are members of the faculty of the University of California.

VAN DE KAMP PETER

Basic astronomy New York Random House, Inc., 1952 400 p. illus. 21 cm. $3.75 595

Contents (abridged) Part I. A survey of the solar system. Sky and telescope. Matter and light. Sun, earth and moon. The planetary system. Part II. The mechanics of stars and planets. The earth as observational center of the universe. Motions of the planets as viewed from earth and sun. The motions of the stars. The mechanics of double stars. Kepler's laws of planetary motion. Newton's law of gravitation. The masses of earth, sun, moon, planets, and stars. Part III. The physical-chemical properties of sun and stars. The composition of starlight. The nearest stars. Atomic structure and radiation. The atmospheres of sun and stars. The interiors of sun and stars. The source of solar and stellar energy. Part IV. The Milky Way system and beyond: The arrangement of the stars—the galactic system. Interstellar matter and the dimming of starlight. Patterns of stellar motions. The galactocentric viewpoint. The rotation of the galactic system. The extragalactic objects. A selected bibliography. Index.

Note An introductory survey that is so written and organized that it may be used either as a text in college courses or as a source of information for general readers. Not a "popular" astronomy in the sense that the wonders of astronomy are stressed, it is nevertheless a book that can be used by mature readers without the aid of an instructor. The bibliography includes books only and is intended for students and general readers who wish to pursue the subject by themselves. The author is Professor of Astronomy at Swarthmore College and Director of the Sproul Observatory.

WILLIAMS KENNETH POWERS

The calculation of the orbits of asteroids and comets. Evanston The Principia Press of Illinois 1934 214 p. illus. 26 cm. $4.00. 596

Contents: Astronomical coordinates. Interpolation. The problem of two bodies. The position in the orbit. The equation of Gauss. Correction. Intermediate elements. The method of Laplace. The method of Gauss. The method of Olbers. The construction of an ephemeris. Appendix. Bibliography. Index.

Note A treatise intended to acquaint students of advanced college mathematics with the problem of orbit computation, which historically is one of the most important problems the mathematician has solved, having significance not only for astronomy but for science in general. The basic theory as developed by Euler, Lagrange, Laplace, and Gauss is outlined as simply as the material will permit, and only fundamental methods and procedures are considered. There are numerous exercises to give the student familiarity with the nature of the problem although the many questions which may arise in orbit work are not covered except briefly. References are however made to books and periodicals where more information can be found. Machine computation dominates the book, but logarithmic calculations are not needed. Intended mainly for the student of mathematics who has no expectation of specializing in the subject of orbit computation, but useful for the student of astronomy as well.

INSTRUMENTS

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

Astronomical photoelectric photometry A symposium presented on December 31 1951 at the Philadelphia meeting of the American Association for the Advancement of Science. Edited by Frank Bradshaw Wood. Washington, D C. American Association for the Advancement of Science 1953 141 p. illus 23 cm. $3.75 597

Contents: The use of direct-current techniques in photoelectric photometry of stars, by A. P. Linnell. Alternating-current techniques and sources of error in photoelectric photometry of stars, by J. S. Hall. The use of pulse-counting techniques in photoelectric photometry of stars, by W. Blitzstein. Photoelectric installation of the Observatoire de Haute Provence, by A. Lallemand. Photoelectric installation at the Observatoire de Haute Provence, by F. Lenouvel. The performance of two pulse-counting stellar photometers, by R. O. Redman and G. G. Yates. On the use of servomechanisms in photoelectric photometry of stars, by T. Walraven. Limits of sensitivity and precision attainable by photoelectric methods—critical summary and comparison of various techniques, by A. E. Whitford.

Note Problems of instrumentation and techniques of astronomical photoelectric photometry are discussed in this volume. The authors are members of the scientific staffs of various observatories in the United States of America and other countries and, generally speaking, they addressed themselves to graduate astronomers and other scientists with similar problems. The individual papers are very technical. All but one include bibliography references, and the bibliography appended to the first paper runs to [illegible] citations.

INGALLS ALBERT G., editor

Amateur telescope making. With contributions by R. W. Porter and others. With a foreword by Harlow Shapley New York Scientific American, Inc., 1935 499 p. illus. 20 cm. $5.00 598

Contents (abridged) Mirror making for reflectors. Making the mounting. 100-foot sun telescope. Finding celestial objects. Telescope housings. The prism or diagonal. Optical flats. The Cassegrainian. Making eyepieces. The amateur's workshop. Tools and materials—grinding. Foucault test. Polishing. Figuring. The paraboloid—zonal testing. Silvering. Mounting the mirror. Mounting the tube. The [illegible]. Motor drive. Grinding and polishing

machines. Telescope oculars. Astronomical oculars. Solar phenomena. Compound telescopes. Flotation systems—machine polishing. Making astronomical flats. Celestial photography Ronchi test. Simple clock drive. Index.

—— Amateur telescope making, advanced A sequel to Amateur telescope making New York Scientific American, Inc, 1944 650 p illus 20 cm $6 00 599

Contents (abridged) Part I, Having to do with the construction of optical instruments Mirror making. Metal mirrors and flats. Prisms, flats, mirrors. Small lenses. Metal parts. The refractor Telescope drives. Springfield mounting. The Schmidt camera. A precision clock. Micrometers. Part II, Having to do with some of the more practical aspects of observing· Uses for telescopes. Meteor photography Stellar photography Eclipse photography Atmosphere, telescope and observer The richest-field telescope. Index.

—— Amateur telescope making (Book three) A sequel to Amateur telescope making (Book one), and to Amateur telescope making advanced (Book two) Albert G Ingalls, editor Contributions to amateur precision optics by advanced amateurs and professionals. Revised edition. New York Scientific American, Inc., 1956 644 p illus 20 cm $7 00 600

Contents (abridged) Optical systems for astronomical photography High vacuum equipment. The design and construction of five-foot Wadsworth type grating spectrograph. Thermal effects of observatory paints. Optical flats. Lens production. A spherometer for measuring radii of curvature of small strongly curved surfaces. A reflecting autocollimator for precise measurement of prism angles. The separation of abrasives on a laboratory scale. Plates and films for astronomical photography Autocollimation test for Schmidt cameras. The construction of a Schmidt camera. The interference polarizing monochromator. Telescope eyepieces. On computing the radii of an achromatic objective. A Herschel telescope with correcting lens. Editor's chapter Index.

Note. Each of these books is essentially compilation of articles from journals and other short writings written by various persons and at various times. The first one was devoted entirely to telescope making and was addressed primarily to dedicated amateur astronomers. Although telescope making is the principal subject of the second and third collections, there has also been a shift toward the making f optical instruments in general. Together the books cover wide range of information on scientific principles, standard techniques, and ingenious methods and ideas. Some of the material is of interest to professional opticians as well as to amateurs.

ROSEN, EDWARD

The naming of the telescope. Foreword by Harlow Shapley New York Henry Schuman, 1947 110 p illus 19 cm $2 50 601

Contents: Foreword by H. Shapley The statement of the problem. The attribution to Cesi. First witness for Cesi John Baptist Della Porta. Della Porta's letter of attribution. Second witness for Cesi. John Faber The unveiling of the term telescope. Cesi's own testimony "Nostro telescopio." Jerome Sirturi. Julius Caesar Lagalla. The attribution to Demisiani. John Demisiani. Was Cesi the true author of Faber's attribution? Conclusions. The growth of the rival traditions. Joseph Biancani and the origin of the term cannocchiale. Abbreviations. Notes. Index.

Note When in 1610 Galileo was first writing about the newly invented device for viewing distant objects, he used the Latin terms organum instrumentum, perspicillum, or the Italian occhiale. Some of his countrymen employed the latter· others preferred cannone from which was evolved the combination cannocchiale But all these designations were promptly superseded by new and more distinctive word from the Greek, telescopio, which was adopted by Galileo and which has been variously attributed to him and to others. The question of who originated the word is the subject of the present study It is a story of conflicting claims which the author has evaluated by much research into books and correspondence dated three and one-half centuries ago.

WOODBURY, DAVID OAKES

The glass giant of Palomar With 50 drawings by the author and sketches by Russell W Porter Revised and enlarged edition New York Dodd, Mead and Company, 1953 385 p illus. 24 cm $5 00 602

Contents (abridged) Part I, Ancestry· Jules Verne becomes pilot Design for genius. The world's largest—1900. Mohammed to the mountain. The sun and the stars. Reflector or refractor? The 100-inch telescope. What next? Part II, The giant is born Another voyage begins. The men. What kind of mirror shall we have? Fused quartz. Faith, hope and Pyrex. Bringing up the rear Big glass. Anything may happen. Pyrex behaves. Part III, The giant is reared Paper telescopes. A million pounds of glass and steel. Palomar Westward ho! Fire and steel. On the mountain. Men after glass. Twenty-one men in white. In the optical shop. A martyr to the cause. Part IV The voyage begins. In the giant's bosom. Science and the citizen. Whither among the stars? Open seas ahead. Whither the reader?

Note A popular account of the construction of the 200-inch reflecting telescope from its inception and design in 1928 to the completion f the mount in 1939 including related discussions on the theory of telescope design, the difficulties encountered in pouring the mirror and the story of the men behind its construction. Told in journalistic style with a considerable amount of dialogue and anecdote. There is a list of 10 books for further reading for the layman.

WRIGHT, HELEN

Palomar, the world's largest telescope. With an introduction by Ira S Bowen. Illustrated by Milford Zornes. New York The Macmillan Company, 1952 188 p 20 cm. $3 75 603

Contents Prologue. Origin of the telescope. Birth of the telescope. Palomar Mountain. A 200-inch mirror. Telescope and dome. Dedication of the Hale telescope.

Note Described in this small book is the human adventure of designing and building the great Hale telescope of the Palomar Observatory The first chapter 32 pages long, outlines the history of the telescope in general. The remainder of the book is devoted exclusively to the Hale telescope. The story is covered from the conception of the telescope by the astronomer John E. Hale to the dedication of the completed instrument. It is told in personalized style in such sentences as the following· "Six months later as they prepared to cast the 200-inch, he wrote to Hale: 'The fact remains that this disk in all its details is whale! Every detail of the process is on a scale so much larger than anything heretofore attempted that the setup is already somewhat appalling to contemplate.' The book is designed for general reading, and scientific details are described insofar as is possible in the common language.

ASTROPHYSICS

ALLER, LAWRENCE H

Astrophysics the atmospheres of the sun and stars New York The Ronald Press Company, 1953 412 p illus 23 cm. $12 00 604

Contents. Survey of the basic data. Atomic and molecular spectra. The gas laws and the equations of state, turbulence. Excitation, ionization, and dissociation. The emission and absorption of radiation. The radiation of the stars. The continuous spectra of the sun and stars. The Fraunhofer spectrum. Solar phenomena. Index of names. Index of subjects.

—— Nuclear transformations stellar interiors, and nebulae New York The Ronald Press Company, 1954 291 p illus. 23 cm. $12 00 605

Contents. Stellar interiors and nuclear transformations. Model stars. The cepheids and long-period variables. Stars with extended

envelopes, novae, and supernovae. The planetary nebulae. The interstellar medium. Index of names. Index of subjects.

Note: A co-ordinated treatment of the astrophysical knowledge that pertains to the atmospheres and interiors of the stars and to nebulae, stellar envelopes, etc. Basic physics, accumulated data, techniques of investigation and measurement are all given due emphasis. Considerable attention is given to showing relationships among the basic principles and accepted interpretations of the phenomena of stellar radiation. The books are organized as texts, with problems for students to solve and literature references for further reading; however, the treatment is on a graduate level, and they are equally useful to graduate scientists working not only in astrophysics but also in such fields as the investigation of radio wave propagation. The expository text includes examples of computation that show the applications of formulas and the solving of equations. A wide range of reference data is presented in tables. The volumes are well indexed.

ALLER, LAWRENCE H.

Gaseous nebulae. New York John Wiley and Sons, Inc., 1956 322 p. illus. 24 cm. (The international astrophysics series general editors M. A. Ellison and A. C. B Lovell. Volume III) $11.00. 606

Contents: Types of gaseous nebulae. Methods of observation. The distances, dimensions, and masses of the gaseous nebulae. Physical processes in gaseous nebulae. The forbidden lines. The stars that illuminate the gaseous nebulae. Structure and internal motions of the planetary nebulae. The diffuse gaseous nebulae. Name index. Subject index.

Note: An advanced-level text for the instruction of college students majoring in astronomy. It is suitable also for use as a reference book in libraries on astronomy. Its scope is indicated by the chapter titles listed above. The author has assumed that his readers will be familiar with elementary physics and astronomy and with the terminology and symbols used in professional astronomy. Some mathematical sophistication is also assumed. The chapters are all documented with references to the periodical literature, and in some instances the reference lists are extensive. The subject index is a detailed one. The author index includes the names of authors of the cited literature and makes it possible to use the book as a guide to the journal articles and the books pertaining to gaseous nebulae.

GAMOW, GEORGE

The creation of the universe. New York The Viking Press, 1952 147 p. illus. 22 cm. $3 5 607

Contents: Introduction. Evolution versus permanence. The great expansion. The making of atoms. The hierarchy of condensations. The private lives of the stars. Conclusion. Appendix. Index.

Note: The history and evolution of the universe is discussed in this book, which rounds out the author's trilogy that began with *The birth and death of the sun,* which was followed by *Biography of the earth.* A lively style and easily understood analogies make the subjects available to all educated readers in spite of a rather liberal use of technical terms. The book is an extreme popularization of very advanced data and theory, but it is scientifically accurate and will appeal not only to lay readers but also to scientists working outside their own fields.

HALL, JOHN SCOVILLE, AND A. H. MIKESELL

Polarization of light in the galaxy as determined from observations *of 551* early-type stars. Washington, D C. Government Printing Office 1950 62 p. illus. 29 cm. (United States. Naval Observatory Publications. Second series vol. XVII, part I) 608

Contents: Introduction. Method of observation. [illegible] polarizing refractor. Accuracy. The observations. Earth's atmosphere. Color check. Systematic differences. External agreement. List of observations. Summary of data. Comparison with observations of W. A. Hiltner. Dependence of data. Space distribution. Apparent magnitude. Galactic latitude. Color excess. Intensities. Distance. Angular separation. Visual observation. Stars of special interest. Absorption regions.

Note: Data collected in 1,314 measurements of 551 stars are presented in this publication in two principal tables, the first of which is composed of the individual observations and the second a summary of the data. The first-mentioned table identifies the star by number, gives the date of the observation, the position angle and the percent of polarization. The following table includes further information on space distribution, magnitude, spectra type, color excess, etc. The tabulated data are discussed and compared with the results from other observers in the final 17 pages of the pamphlet. The work is of interest to professional workers in astronomy and astrophysics.

HYNEK, JOSEPH ALLEN, editor

Astrophysics. A topical symposium commemorating the fiftieth anniversary of the Yerkes Observatory and a half century of progress in astrophysics. New York McGraw Hill Book Company Inc., 1951 703 p. illus. 24 cm. $14.00 609

Contents: Introduction. On the development of astrophysics during the last half century, by B. Strömgren. Part one, Spectroscopic astrophysics. Classification of stellar spectra, by P. C. Keenan and W. W. Morgan. Interpretation of normal stellar spectra, by L. H. Aller. The analysis of peculiar stellar spectra, by O. Struve. Molecular spectra in cosmic sources, by P. Swings. The growth of our knowledge of the physics of the stars, by B. Strömgren. Part II, Physics of the solar system. The sun and stellar radiation, by E. Pettit. Comets, by N. T. Bobrovnikoff. On the origin of the solar system, by G. P. Kuiper. Part III, Physics of binary and variable stars. Visual binary stars and stellar parallaxes, by G. Van Biesbroeck. Spectroscopic binaries and stars with composite spectra, by J. A. Hynek. Eclipsing binaries, by N. L. Pierce. The intrinsic variable stars, by C. Payne-Gaposchkin. Part IV, Physics of cosmic matter. Interstellar matter, by J. L. Greenstein. The structure, the composition, and the source of energy of the stars, by S. Chandrasekhar. Name index. Star index. Subject index.

Note: Each of the papers in this outstanding collection is the work of one or more scientists of international reputation, most of whom have been associated with the Yerkes Observatory. Generally speaking, in each paper the development of a specific area of astrophysics during the last half-century is outlined, its present state is described, and there is some discussion of problems that still challenge the scientists. The papers are addressed essentially to graduate students and young scientists who are beginning work in astrophysics.

MERRILL, PAUL WILLARD

Lines of the chemical elements in astronomical spectra. Washington, D C. Carnegie Institution of Washington, 1956 167 p. illus 28 cm. (Carnegie Institution of Washington. Publication 610 Papers of the Mt. Wilson Observatory Vol. IX) $2.00. 610

Contents (abridged): Introduction. Hydrogen. Helium. Lithium. Beryllium. Boron. Carbon. Nitrogen. Oxygen. Fluorine. Neon. Sodium. Magnesium. Aluminum. Silicon. Phosphorus. Sulfur. Chlorine. Argon. Potassium. Calcium. Scandium. Titanium. Vanadium. Chromium. Manganese. Iron. Cobalt. Nickel. Copper. Zinc. Gallium. Elements with atomic numbers 32-100: Krypton. Strontium. Yttrium. Zirconium. Niobium (Columbium). Technetium. Indium. Barium. Rare earths. Lanthanum. Europium. Bibliography: Tables of wavelengths of lines in astronomical spectra. Photometric tracings of solar and stellar spectra. General bibliography. Appendixes: Partial Grotrian diagrams of astrophysical interest, by C. E. Moore and P. W. Merrill. Glossary of special astronomical terms.

Note: Essentially this book is a guide to the large amount of information on stellar spectra which is available in previously published scientific journals and monographs. The information found in these sources is carefully surveyed, and its gist is presented under the headings listed in the above contents. A typical paragraph reads as follows: "Bands of TiO. Absorption bands of TiO are present in spectra of the sun (P187) Pegasi, type gM3 (A45) and long-period variables (M00, A33). The strongest band head is at 6122.4," the symbols within the parentheses being references to the bibliography. In addition to these organized abstracts, there are three tables of chemical elements and wavelengths, about 60 pages of partial Grotrian diagrams and a two-page glossary. The general bibliography runs to 18 two-columned pages.

MOORE, CHARLOTTE E

A multiplet table of astrophysical interest Revised edition Princeton Published by the Observatory, 1945 2 v 30 cm. (Princeton University Observatory Contributions No 20) 611

Contents (abridged) Part I, Table of multiplets: Basis of selection. General arrangement of the multiplet table. Arrangement of the multiplets of each spectrum. Spectroscopic notation. Special notes on individual spectra. Spectra omitted from the R M T Forbidden lines. Bibliography Index by pages. Index by elements. Revised multiplet table: Body of table. Forbidden lines. Part II, Finding list: Introduction. Part A, Observed and permitted predicted lines. Blends. Scope. Part B Forbidden lines. Body of multiplet table. Forbidden lines.

Note A successor to the author's work of the same title published in 1933 It is compendium of carefully selected data pertaining roughly to the wavelengths from λ2950 to λ13000. Within these limits, only the lines thought to be useful in the interpretation of astronomical spectra are listed. These are selected from the elements sufficiently abundant to appear in stellar spectra, and from only those stages of ionization and types of excitation which are to be expected. References to sources of the data are cited. In addition to documenting the tables, the bibliography—which is arranged alphabetically by author and includes 410 citations—serves as guide to the international literature on groups of spectral lines and to sources of other tables of multiplets. Most of the space in both parts is devoted to the tables, and the Contents listed above indicate chiefly the titles of sections in the prefatory matter Aside from its usefulness in astrophysics, the work is of value in general spectroscopy An expansion of part of this work has been published, see the Author Inde t this bibliography

MOULTON, FOREST RAY

An introduction to celestial mechanics. Second revised edition New York The Macmillan Company, 1935 437 p illus 22 cm. $6 50 612

Contents Preliminary considerations. The constellations. Telescopes. The earth. The motions of the earth. Time. The moon. Eclipses. The law of gravitation. The solar system. The planets. Meteors and comets. The sun. Evolution of the solar system. Stars and nebulae. The sidereal structure. Table of constants. Index of names. Star and nebulae index. General index.

Note The author develops the subject from the familiar earth and evening constellations out to the galaxies and supergalaxies of stars. Useful star maps and tables of condensed statistical information are provided. Lists of questions and exercises have been supplied at frequent intervals throughout the book to add to its usefulness as a text for college students.

SMITHSONIAN INSTITUTION ASTROPHYSICAL OBSERVATORY

Annals of the Astrophysical Observatory of the Smithsonian Institution Volume 7 By L B Aldrich and W H Hoover Washington D C Smithsonian Institution, 1954 184 p illus 31 cm. (Smithsonian Institution Publication 4138) $1 75 613

Content *Annals, 1941 1952 The solar-constant program since 1939* Summary of solar constant data, October 1939 through December 1952 Pyrheliometry Other instruments. Special studies of global sun and sky radiation. Statistical studies of the solar-constant record. Ozone *Summary of Volume VII. Appendix Measurement* of ozone. Bibliography Index.

Note The latest of series which is published at 10-year intervals, each volume of which summarizes the researches and accomplishments of the scientific staff of the Astrophysical Observatory of the Smithsonian Institution during the preceding decade. The contents of the present volume are noted above. The third chapter devoted largely to a tabulation of the Observatory' determinations of solar constants and continuing similar records in earlier volumes, is noteworthy feature. The fourth chapter contains extensive tabulations of pyrheliometer data. The bibliography printed in the appendix, lists contributions of the staff of the Astrophysical Observatory published since the compilation of the bibliography that appeared in Volume v of the Annals.

STRUVE, OTTO

Stellar evolution, an exploration from the observatory Princeton Princeton University Press, 1950 266 p illus 24 cm $5 00 614

Contents. Probing the stars' chemical composition. Some problems of stellar evolution. The origin and development of close double stars. Index.

Note A substantial contribution to the literature of astrophysics. Essentially it is an exploratory survey for theory or hypothesis that will explain the evolution of the stars in terms of the accumulated observational data. Earlier hypotheses are examined critically The author gives special attention to the ideas of von Weizsaecker Unsöld, and Ambarzumian among others, and also puts forth some tentative conclusions of his own. The style of the book is rather technical but as the author points out, the work is not intended for astronomers but rather for such scientists as physicists and chemists who desire some insight into current astrophysical problems.

WINTNER, AUREL

The analytical foundations of celestial mechanics. Princeton Princeton University Press, 1941 448 p 23 cm (Princeton mathematical series 5) $7 50 615

Contents Dynamical operations. Local and non-local questions. Dynamical systems. The problem of two bodies. The problem of several bodies. Introduction to the restricted problem. Historical notes and references. Index.

Note Canonical systems, theory of phase space, perturbation theory dynamical systems are linked together in this volume for advanced students of mathematics. The historical problem of three bodies finds special emphasis. Beyond its technical solution the book serves as an introduction to the analytical treatment of theoretical dynamics. Both the formal aspects and the questions in the large are presented in the form in hich they are always applied, not only in the theory of the solar system, but also in quantum theory References are included.

SUN AND SOLAR SYSTEM

BABCOCK, HAROLD DELOS, AND CHARLOTTE E MOORE

The solar spectrum λ 6600 to λ 13495 Washington, D C Carnegie Institution of Washington, 1947 95 p 29 cm. (Carnegie Institution of Washington. Publication 579) $2 00 616

Content Introduction Instruments Wave lengths in table A. Intensities in the spectrum of the solar disk. Intensities of atmospheric lines. The segregation of atmospheric lines. Intensities of lines in sunspot spectra. Identification of solar lines. Excitation potentials. Fraction of background radiation removed by solar absorption lines. Comparison of table A with the Utrecht photometric atlas. Comparison of infrared solar data with the spectra of some other stars. Elements recognized in the solar spectrum. Suggestions for further work. Acknowledgments. Symbols, abbreviations, and definitions. Table A Infrared solar spectrum. Bibliography

Note A report of research and tabulation of spectrographic measurements made of the solar disk, spots, and chromosphere for the infrared wavelengths. Discussion of the methods used and results obtained as well as comparison f the work with that of other investigators is made. The uthors' aim has been to provide information which will assist scientists in clarifying the nature of the solar atmosphere, star spectra, and the behavior of atoms and molecules.

BROOKS CHARLES FRANKLIN, AND OTHERS

Eclipse meteorology with special reference to the total solar eclipse of August 31 1932 *By Charles F Brooks Sterling P Fergusson, Herbert H Kimball Bernard Haurwitz, Eleanor Stabler Brooks Jerome Namias, Charles H Pierce Harry Wexler and Ed*

ward M. Brooks. Cambridge, Mass., Harvard University Press, 1941. 100 p. illus. 25 cm. (Harvard meteorological studies, No. 5) $1.5[illegible] 617

Contents: Synopsis. Introduction. Program, method, ... and the weather for the eclipse of August 31, 1932. Solar radiation and its immediate effect on temperature. The temperature changes. Changes of pressure and wind at the surface. Humidity changes, shadow-bands. Free air data obtained during the eclipse of August 31, 1932. Suggestions for further study. Bibliography.

Note: A summary of the results obtained from detailed observations from seven hundred stations ... [illegible] ... The bibliography has 65 references to the world literature of the subject.

BROWN, HARRISON, AND OTHERS, editors

A bibliography on meteorites. Editor: Harrison Brown. Associate editors: Gunnar Kullerud and Walter Nichiporuk. Chicago, University of Chicago Press, 1953. 686 p. 28 cm. $1[illegible] 618

Note: A comprehensive bibliography of the international literature on meteorites ... [illegible]

BUDDHUE, JOHN DAVIS

Meteoritic dust. Albuquerque, The University of New Mexico Press, 1950. 102 p. illus. 23 cm. (University of New Mexico. Publications in meteoritics, No. two. A monograph of the Institute of Meteoritics of the University of New Mexico. Lincoln LaPaz and Frederick C. Leonard, editors) $1.50 619

Contents: Abridged: History ... [illegible] ... Bibliography.

Note: [illegible] ... A bibliography of 1[illegible] literature ... [illegible]

ECKERT, W. J., AND OTHERS

Coordinates of the five outer planets, 1653–2060. By W. J. Eckert, Dirk Brouwer and G. M. Clemence. Washington, D.C., Government Printing Office, 1951. [illegible] p. 29 cm. (U. S. Naval Observatory. Nautical Almanac Office. Astronomical papers prepared for the use of the American ephemeris and Nautical almanac. Vol. xii) o.p. 620

Contents: The ... [illegible]

Note: The volume gives the heliocentric ... rectangular coordinates for the five outer planets Jupiter, Saturn, Uranus, Neptune, and Pluto ... [illegible]

GAMOW, GEORGE

The birth and death of the sun; stellar evolution and subatomic energy. Illustrated by the author. New York, The Viking Press, 1945. [illegible] p. illus. [illegible] cm. $[illegible] 621

Contents: [illegible]

Note: An outstanding exposition of the ... [illegible]

HERGET, PAUL

Solar coordinates 1800–2000. Washington, D.C., Government Printing Office, 1953. [illegible] p. [illegible] cm. (U. S. Naval Observatory. Nautical Almanac Office. Astronomical papers prepared for the use of the American ephemeris and Nautical almanac. Vol. 14) $[illegible] 622

Note: Geocentric coordinates of the sun and the coordinates of ... [illegible]

HERGET, PAUL

Coordinates of Venus, 1800–2000. Washington, D.C., Government Printing Office, 1955. [illegible] p. [illegible] cm. (U. S. Naval Observatory. Nautical Almanac Office. Astronomical papers prepared for use of the American ephemeris and Nautical almanac. Vol. xv part iii) $[illegible] 623

Note: A companion work to the author's Solar coordinates, 1800–2000, described above. It provides in tabular form new values for

MOORE, CHARLOTTE E

A multiplet table of astrophysical interest. Revised edition Princeton Published by the Observatory, 1945 2 v 30 cm. (Princeton University Observatory Contributions No 20) 611

Contents (abridged) Part I, Table of multiplets Basis of selection. General arrangement of the multiplet table. Arrangement of the multiplets of each spectrum. Spectroscopic notation. Special notes on individual spectra. Spectra omitted from the R M T Forbidden lines. Bibliography Index by pages. Index by elements. Revised multiplet table Body of table. Forbidden lines. Part II, Finding list Introduction. Part A. Observed and permitted predicted lines. Blends. Scope. Part B Forbidden lines. Body of multiplet table. Forbidden lines.

Note. A successor to the author's work of the same title published in 1933 It is compendium of carefully selected data pertaining roughly to the wavelengths from λ2950 to λ13000. Within these limits, only the lines thought to be useful in the interpretation of astronomical spectra are listed. These are selected from the elements sufficiently abundant to appear in stellar spectra, and from only those stages of ionization and types of excitation which are to be expected. References to sources of the data are cited. In addition to documenting the tables, the bibliography—which is arranged alphabetically by author and includes 410 citations—serves as a guide to the international literature on groups of spectral lines and to sources of other tables of multiplets. Most of the space in both parts is devoted to the tables, and the Contents listed above indicate chiefly the titles of sections in the prefatory matter Aside from its usefulness in astrophysics, the work is of value in general spectroscopy An expansion of part of this work has been published, see the Author Index in this bibliography

MOULTON, FOREST RAY

An introduction to celestial mechanics Second revised edition. New York The Macmillan Company, 1935 437 p illus. 22 cm. $6 50 612

Content Preliminary considerations. The constellations. Telescopes. The earth. The motions of the earth. Time. The moon. Eclipses. The law of gravitation. The solar system. The planets. Meteors and comets. The sun. Evolution f the solar system. Stars and nebulae. The sidereal structure. Table of constants. Index of names. Star and nebulae index. General index.

Note The uthor develops the subject from the familiar earth and evening constellations out to the galaxies and supergalaxies of stars. Useful star maps and tables f condensed statistical information are provided. Lists of questions and exercises have been supplied at frequent intervals throughout the book to add to its usefulness as text for college students.

SMITHSONIAN INSTITUTION ASTROPHYSICAL OBSERVATORY

Annals of the Astrophysical Observatory of the Smithsonian Institution Volume 7 By L B Aldrich and W H. Hoover Washington, D C Smithsonian Institution, 1954 184 p. illus 31 cm (Smithsonian Institution. Publication 4138) $1 75 613

Contents Annals, 1941 1952 The solar-constant program since 1939 Summary of solar constant data, October 1939 through December 1952 Pyrheliometry Other instruments. Special studies of global sun and sky radiation. Statistical studies of the solar-constant record. Ozone. Summary of Volume VII. Appendix Measurement of ozone. Bibliography Index.

Note The latest of a series which is published at 10-year intervals, each volume of which summarizes the researches and accomplishments of the scientific staff of the Astrophysical Observatory of the Smithsonian Institution during the preceding decade. The contents of the present volume are noted above. The third chapter devoted largely to tabulation of the Observatory' determinations f solar constants and continuing similar records in earlier volumes, is noteworthy feature. The fourth chapter contains extensive tabulations of pyrheliometer data. The bibliography printed in the appendix, lists contributions of the staff of the Astrophysical Observatory published since the compilation of the bibliography that appeared in Volume of the Annals.

STRUVE, OTTO

Stellar evolution an exploration from the observatory Princeton Princeton University Press, 1950 266 p illus 24 cm. $5 00 614

Contents Probing the stars' chemical composition. Some problems of stellar evolution. The origin and development of close double stars. Index.

Note A substantial contribution to the literature of astrophysics. Essentially it is an exploratory survey for a theory or hypothesis that will explain the evolution of the stars in terms of the accumulated observational data. Earlier hypotheses are examined critically The author gives special attention to the ideas of von Weizsäcker Unsöld, and Ambartsumian among others, and also puts forth some tentative conclusions of his own. The style of the book is rather technical but, as the author points out, the work is not intended for astronomers but rather for such scientists as physicists and chemists who desire some insight into current astrophysical problems.

WINTNER, AUREL

The analytical foundations of celestial mechanics Princeton Princeton University Press 1941 448 p 23 cm (Princeton mathematical series 5) $7 50 615

Contents. Dynamical operations. Local and non-local questions. Dynamical systems. The problem of two bodies. The problem of several bodies. Introduction to the restricted problem. Historical notes and references. Index.

Note Canonical systems, theory of phase space perturbation theory dynamical systems are linked together in this volume for advanced students of mathematics. The historical problem of three bodies finds special emphasis. Beyond its technical mission, the book serves as an introduction to the analytical treatment of theoretical dynamics. Both the formal aspects and the questions in the large are presented in the form in which they are always applied, not only in the theory of the solar system, but also in quantum theory References are included.

SUN AND SOLAR SYSTEM

BABCOCK, HAROLD DELOS, AND CHARLOTTE E MOORE

The solar spectrum, λ 6600 to λ 13495 Washington, D C Carnegie Institution of Washington, 1947 95 p 29 cm (Carnegie Institution of Washington Publication 579) $2 00 616

Contents Introduction. Instruments. Wave lengths in table A. Intensities in the spectrum of the solar disk. Intensities of atmospheric lines. *The segregation of atmospheric lines.* Intensities of lines in sunspot spectra. Identification of solar lines. Excitation potentials. Fraction of background radiation removed by solar absorption lines. Comparison of table A with the Utrecht photometric atlas. Comparison of infrared solar data with the spectra of some other stars. Elements recognized in the solar spectrum. Suggestions for further work. Acknowledgments. Symbols, abbreviations, and definitions. Table A Infrared solar spectrum. Bibliography

Note A report of research and tabulation of spectrographic measurements made of the solar disk, spots, and chromosphere for the infrared wavelengths. Discussion of the methods used and results obtained as well as comparison of the work with that of other investigators is made. The uthors' aim has been to provide information which will assist scientists in clarifying the nature of the solar atmosphere, star spectra, and the behavior f atoms and molecules.

BROOKS, CHARLES FRANKLIN, AND OTHERS

Eclipse meteorology with special reference to the total solar eclipse of August 31, 1932 By Charles F Brooks, Sterling P Fergusson, Herbert H Kimball Bernard Haurwitz, Eleanor Stabler Brooks Jerome Namias, Charles H. Pierce Harry Wexler and Ed

ward M Brooks. Cambridge, Mass. Harvard University Press, 1941 109 p. illus. 25 cm. (Harvard meteorological studies. No. 5) $1.25 617

Contents Synopsis. Introduction. Program, method, stations, and the weather, for the eclipse of August 31 1932 Solar radiation and its immediate effect on temperature. The temperature changes. Changes of pressure and wind at the surface. Humidity changes. Changes of pressure and wind at the surface. Humidity cloudiness, shadow bands. Free air data obtained during the eclipse of August 31 1932. Suggestions for further study Bibliography

Note A summary of the results obtained from detailed observations from several hundred stations concentrated in New England but extending over large part of the United States, to determine the effect upon weather of the temporary shutting off of the sun's radiant energy from the earth during an eclipse The work devotes considerable space to technical investigation of the main controversial point in eclipse meteorology i.e., the question of whether or not defînite system of pressure and winds develops around the chilled and contracted air of the eclipse shadow and thus creates what is referred to as "the eclipse cyclone. The bibliography has 95 references to the world literature of the subject.

BROWN HARRISON, AND OTHERS editors

A bibliography on meteorites. Editor Harrison Brown Associate editors Gunnar Kullerud and Walter Nichiporuk. Chicago University of Chicago Press 1953 686 p. 23 cm. $12.50 618

Note A comprehensive bibliography of the international literature on meteorites and closely related subjects. It is arranged chronologically and runs from 1491 to 1950. Gives for each entry the author' name ("author unknown" is noted for anonymous works) full title, and literature reference including full pagination. An author index and journal index are included. A complementary treatise under the title, *Meteorites and their properties*, is projected.

BUDDHUE JOHN DAVIS

Meteoritic dust. Albuquerque The University of New Mexico Press, 1950 102 p. illus. 23 cm. (University of New Mexico. Publications in meteoritics. No two A monograph of the Institute of Meteoritics of the University of New Mexico Lincoln LaPaz and Frederick C. Leonard editors) $1.50 619

Contents (abridged) Historical review Methods of collecting dust. Types of particles. Size of particles. Physical tests. Chemical tests. The natural deposit. Dust in hail and snow Interstellar matter. The origin of meteoritic dust. The rate of fall of meteoritic dust Appendices Details concerning cuboid particles. Localities where deep-sea spherules have been found. Bibliography

Note The brief historical review with which this study opens is summary with literature references of previous studies of meteoritic dust From page 11 to the end of the volume, the methods and results of the author' own studies are presented and are related to previous studies by other investigators. Detailed data on the aspects of the subject which are named in the contents above are presented and discussed A bibliography of 108 literature citations and plates containing 14 photographs of dust specimens are included.

ECKERT W J AND OTHERS

Coordinates of the five outer planets 1653–2060. By W J Eckert, Dirk Brouwer and G M Clemence. Washington, D C. Government Printing Office, 1951 327 p. 29 cm. (U S. Naval Observatory Nautical Almanac Office. Astronomical papers prepared for the use of the American ephemeris and Nautical almanac. Vol. XII) o.p. 620

Contents The differential equations. Method of integration. The machine calculation. Data recorded Accuracy of the integration. Comparison with observation and constants of integration. Arrangement of the printed coordinates. Tabular comparisons. Table of Everett coefficients. Coordinates of Jupiter—Saturn—Uranus—Neptune—Pluto. Basic data.

Note This volume gives the heliocentric equatorial rectangular coordinates for the five outer planets Jupiter Saturn, Uranus, Neptune, and Pluto, at 40-day intervals from 1653 to 2060 referred to the mean equinox and equator 1950.0 They were obtained by the numerical integration of the equations of motion in rectangular coordinates. All the forces involving the five planets and the sun were computed from Newton's inverse square law The masses of the four inner planets were added to that of the sun in computing the solar attractions. The attractions are computed to 14 decimals and integrated by modification of Cowell method. The computations were carried out by numerical integration on the IBM Selective Sequence Electronic Calculator The arithmetical computations are described in the introduction to the volume

GAMOW GEORGE

The birth and death of the sun stellar evolution and sub-atomic energy Illustrated by the author New York The Viking Press 1945 245 p. illus 21 cm. $4 75 621

Contents Note on units of measurement. The sun and its energy The anatomy of atoms. The transmutation of elements. Can subatomic energy be harnessed? The alchemy of the sun. The sun among the stars. Red giants and the youth of the sun. White dwarfs and the dying sun. Can our sun explode? The formation of stars and planets Island universes The birth of the universe. Conclusion. Chronology Appendix. Index.

Note An outstanding example of the interpretation of science for general readers. For readers who are not scientists but who have mature interests in science the author discusses the evolution of the universe—with particular reference to the sun—in the light of modern knowledge of atomic structure and energy The author style is vivid one that holds the reader' attention in spite of the fact that he makes rather free use of technical terms. The book was first published in 1940 listed here is version termed "Third printing with new preface and appendix, published in 1945 Outlined briefly in the new preface are some of the developments in physical and astrophysical theory bearing on the subject of the book and made since it was first written. The appendix is titled, Atomic bombs, but it deals mainly with the nuclear reactions that are the basis not only of the bomb but also of nuclear reactors for the production of power

HERGET PAUL

Solar coordinates 1800–2000 Washington D C. Government Printing Office 1953 735 p. 28 cm. (U S Naval Observatory Nautical Almanac Office Astronomical papers prepared for the use of the American ephemeris and Nautical almanac. Vol 14) $5.00 622

Note Geocentric coordinates of the sun and the coordinates of the barycenter of the earth moon system at intervals of four days for the entire 19th and 20th centuries are presented in this volume. The values given are based on new calculations made at the Cincinnati Observatory Also given are the Julian day numbers corresponding to the calendar dates of each entry How the computations were performed on punch-card machines and otherwise the starting values and increments, and the degree of accuracy of the tables are discussed in five-page introduction which precedes the tables.

HERGET PAUL

Coordinates of Venus 1800–2000 Washington D C. Government Printing Office, 1955 523 p. 29 cm. (U S Naval Observatory Nautical Almanac Office. Astronomical papers prepared for use of the American ephemeris and Nautical almanac. Vol. XV part III) $2.50. 623

Note A companion work to the author's *Solar coordinates, 1800–2000*, described below It provides in tabular form new values for

the heliocentric coordinates of Venus. These values are the result of new calculations carried out largely on punched card machines under grant from the International Business Machines Corporation. The basic and mathematical techniques of computation are described in the introduction. The tables contain the following information: date, year month, and day expressed in Greenwich mean time before 1925 January 1 and in Universal Time afterwards, Julian day corresponding to the Greenwich Mean Midnight throughout longitude and latitude referred to the mean equinox and ecliptic of date, and the reduction to the orbit longitude and latitude referred to the equinox and ecliptic of 1950.0 and the radius vector' rectangular coordinates referred to the equinox and equator of 1950.0 The interval used in the tables is four days, the same as in *Solar coordinates*.

KUIPER, GERARD P , editor

The solar system. Vols I II Chicago The University of Chicago Press, 1953–54 2 v illus 25 cm (The University of Chicago Committee on Publications in the Physical Sciences) $12 50 per vol. 624

Contents Vol. I, The sun Introduction by L. Goldberg. The sun as star by B. Strömgren The photosphere, by M. Minnaert. The identification of solar lines, by C. E. Moore. The chromosphere and the corona, by H. C. van de Hulst. Solar activity by K. O. Kiepenheuer Solar radio emission, by J L. Pawsey and S. F Smerd. Solar electrodynamics, by T G. Cowling. Empirical problems and equipment, by C. W Allen and others. Subject index. Index of definitions. Vol. II, The earth as a planet Dimensions and rotation, by Sir H. S. Jones. Dynamics of the earth-moon system, by Sir H. Jeffreys. The interior of the earth, by Sir E. Bullard. The development and structure of the crust, by J T Wilson. Oceanography by H. U Sverdrup. The geochemistry of the crust, by B Mason. The atmosphere up to 30 kilometers, by H. R. Byers. The biochemistry f the terrestrial atmosphere, by G. E. Hutchinson. The absorption spectrum of the atmosphere, by L. Goldberg. Density pressure, and temperature data above 30 kilometers, by F L. Whipple. Emission spectra of twilight, night sky and aurora, by J W Chamberlain and A. B. Meinel. The physics of the upper atmosphere, by D R. Bates. Dynamic effects in the high atmosphere, by M. Nicolet. The earth as seen from outside the atmosphere, by C. T Halliday Albedo, color, and polarization of the earth, by A. Danjon. Subject index. Index of definitions.

Note. Part of a projected treatise in four volumes, of which the latter two will be devoted to planets and comets. The purpose f the work is to give a systematic and comprehensive account of our present knowledge concerning the sun and the other members of the solar system. The various chapters are contributed by internationally known scientists working in astrophysics and related sciences. The level of treatment is that of graduate scientists working at the research level in astronomy and physics. The individual chapters are reasonably full surveys of basic theory mathematical equations and calculations, and accepted values and data. Their texts are supplemented by illustrations wherever illustrations seem to be required. For instance, the chapter entitled "Empirical problems and equipment —which, incidentally was written by 13 authors—contains 54 figures, many of which are reproductions of photographs of apparatus. Literature references are included in all chapters.

MITCHELL, SAMUEL ALFRED

Eclipses of the sun. Fifth edition New York Columbia University Press 1951 445 p illus. 23 cm. $8 50 625

Content The beginnings of astronomy Biblical and classical eclipses. The prediction f eclipses. The verification of eclipses. The spectroscope. Eclipses before the year 1900. Personal experiences in 1900, 1901 and 1905 Eclipses from 1918 to 1929 Eclipses since 1930 The structure of the atom. Series relationships in spectra. Photographing the flash spectrum. Ionization and the flash spectrum. Solar problems and their interpretation through heights The sun's reversing layer Coronal information obtained from eclipses. Our present knowledge of the corona. Solar problems solved and unsolved. *Index.*

Note. A standard nontechnical presentation of theory history and observational techniques. It is addressed to the nonspecialists, especially to general readers and to scientists outside the field of astronomy who want a reliable survey and book of reference. The fourth edition appeared in 1935 The work has been extensively revised in this edition. Although many pages shorter it contains much new information. The additional material is not limited accounts of recent eclipses but includes also recent advances the understanding of solar physics. Also, less space is given to observation of eclipses in ancient times and to details of the author's travels in connection with his own observations.

MOHLER, ORREN C , AND OTHERS

Photometric atlas of the near infra red solar spectrum λ 8465 to λ 25,242 By Orren C Mohler, A. Keith Pierce, Robert R. Mc Math and Leo Goldberg McMath Hulbert Observatory of the University of Michigan. Ann Arbor University of Michigan Press, 1950 7 p , 117 leaves. illus 48 × 32 cm. $10 00 626

Note. Except for an introduction in which instrumentation and recording techniques are described, this book consists entirely of graphs of tracings made at the Mount Wilson Observatory with an instrument set-up composed of a Snow telescope and recording spectrometer the sensitive element in the latter being lead-sulfide photoconductive cell. The graphs are photo offset reproductions of the original records. The work is complementary to M. Minnaert and others, *A photometric atlas f the solar spectrum*, Amsterdam, 1940.

MOHLER, ORREN C

A table of solar spectrum wave lengths 11984A to 25578A Ann Arbor University of Michigan Press 1955 83 p 29 cm. $10 00 627

Note The greater part of this volume (pages 13–83) is devoted to the principal table in which data are tabulated under the following heads. "Observed wave length, A, "Observed wave number K, "Predicted wave number K, "Observed intensity —mA, "Predicted intensity —mA, "Identification, "Wave number f lower state, K," and "Notes. This table is based on observations made with Pfund-type recording monochromators at the McMath-Hulbert and Mount Wilson observatories. The table is prefaced by several pages of comment and interpretation and list of literature references. It is designed to be used with O. C. Mohler and others, *Photometric atlas of the near infra-red solar spectrum λ 8465 to λ 25242* Ann Arbor 1950.

NININGER, HARVEY HARLOW, AND ADDIE D NININGER

The Nininger collection of meteorites, a catalog and a history Sedona, Ariz. American Meteorite Museum, 1950 144 p illus. 26 cm $3 00 628

Contents Introduction. Maps. Catalog. Field notes. Summary Supplement. Appendix. Explanation of plates. Plates.

Note Most of the space in this book is devoted to a detailed listing of the meteorites in the Nininger collection, which is now known as the American Meteorite Museum. The descriptions are arranged by locality in which the specimens were found. In most instances the year of the find is given and there is always mineralogical designation, a statement of the weight, and if more than one specimen is in the collection, statements of the weight of the various fragments. The word descriptions are supplemented by 33 plates of reproductions of photographs, most of which show several specimens. Although essentially a catalogue of museum collection, the book is also unique record of the results of planned program aimed at discovering meteorites.

NININGER, HARVEY HARLOW

Out of the sky an introduction to meteoritics. Denver The University of Denver Press 1952 336 p illus 24 cm. $5 00 629

Content (abridged) Early man and meteorites. Typical falls. The great meteor of March 24 1933. Sound from passing meteors. Fireball clusters and processions. A planned program of search. Composition of meteorites. Etching and preservation. Size of

meteorites. The great Greenland meteorites. Weathering of meteorites. Digging and shipping. Meteorite craters. An explosion crater [illegible]. Meteoritic clouds. Origin of meteorites. Cosmic hearing. Tektites. Great meteorite collections. Proposed National Institute of Meteoritics. Publications by H. H. Nininger. Index.

Note: Detailed reports of observations of meteorites and meteors are combined in this book with specific data on composition, structure, weights, etc., of meteorites. The author is widely known as pioneer investigator of meteor phenomena and as collector of meteorites. He formed the Nininger Collection. In one of the chapters of this book he proposes [illegible] national institute devoted to the study of meteorites. The illustrations include 52 plates, most of which are reproductions of photographs of meteorites.

STETSON HARLAN TRUE

Sunspots in action. With a foreword by Sir Edward V Appleton. New York The Ronald Press Company 1947 252 p. illus. 22 cm. (Humanizing science series edited by Jaques Cattell) $4.00 630

Contents (abridged) Atomic energy and the sun. The solar [illegible]. Measuring sunlight. Sunspots and radio communication. Sunspots, the earth's magnetism, and the northern lights. Radio, solar eclipses, and cosmic effects. The origin of sunspots. Predicting sunspots. Sunspots, weather and living things. Sunspots and the economic cycle. Sunspots, the radio industry and the F.C.C. Our solar terrestrial research. Appendices Bibliography Tables of relative sunspot numbers. Name index. Subject index.

Note: An easy-to-read book in which the current knowledge of the origin and nature of sunspots and of their effects upon the earth and its inhabitants is summarized and discussed. Some of the more plausible hypothetical material is included also. The book is intended for educated laymen, and is therefore written without mathematics and in only semitechnical terminology. However scientists, particularly those in other fields than astronomy will find it informative and perhaps useful. The bibliography is arranged by chapters and refers chiefly to scientific papers and other literature for scientists.

UREY HAROLD CLAYTON

The planets their origin and development. New Haven Yale University Press, 1952 245 p. 25 cm. $5.00 631

Contents The origin of the solar system. The moon. The terrestrial planets. Chemical processes during the formation of the planets. The heat balance of the earth. The abundances of the elements and the chemical composition of the solar system. Summary and conclusions. Appendices. Index.

Note: A new hypothesis pertaining to the formation of the earth and other solar planets is put forth in this book. The main points are in the author's words: "The earth and other terrestrial planets were formed at much lower temperatures than were generally thought to be the case up to the present time. [illegible] A more uniform distribution of iron throughout the silicate phases of the earth existed in the past than exists now and the iron core of the earth has been formed at least partly during geologic time. A considerable part of the book is written in the terminology and concepts of physical chemistry and the author has sought [illegible] theory that would accommodate such facts as the absence of dense cores in some planets and the widely varying chemical composition of the planets and satellites. The book is addressed to astrophysicists, physical chemists, and others with considerable education in the physical sciences.

WATSON FLETCHER G

Between the planets. Revised edition. Cambridge, Mass. Harvard University Press, 1956. 228 p illus. 24 cm. (The Harvard books on astronomy edited by Harlow Shapley and Bart J Bok) $5.00. 632

Contents: Surveying the solar system. The little planets. Whirling fragments. Comets in motion. Anatomy of [illegible] comet. Shooting stars. Meteor showers. Radio wakes [illegible] sound. A meteorite falls. Meteorites in the laboratory. The interplanetary material. Appendix. Index.

Note: Written for laymen, beginning students, amateur astronomers, and scientists working outside their own specialties, this book summarizes the accumulated knowledge on asteroids, comets, meteors, meteorites, and interplanetary dust. It is solidly based on the findings of the astronomers and is appreciated most by readers who have mature though not professional interests in astronomy. The style is semitechnical, but not formidable. There are some 90 graphs and other drawings in the text, and about 35 tables. In addition, 67 plates are collected at the end of the book. The first edition was published in 1941. There are two new chapters in this revised edition, and many revisions in those carried over.

WOOLARD, EDGAR W

Theory of the rotation of the earth around its center of mass. Washington, D C. Government Printing Office 1953 165 p 29 cm. (U S. Naval Observatory Nautical Almanac Office. Astronomical papers prepared for the use of the American ephemeris and Nautical almanac. Vol. xv part 1) $1.50 633

Contents Introduction, general equations of rigid motion. Kinematical equations. Dynamical equations. Form of the solution. Motion of the axis of figure. Motion of the axis of rotation. Motions of the earth relative to the axis of rotation. Kinematical nature of the motion. Precession and nutation of the axis of rotation. The disturbing forces. The forces in terms of the tabular coordinates. Coordinates of the moon. Coordinates of the sun. Development of the disturbing forces. Solution of Poisson's equations. The integrating factors. The integrations. Corrections for approximations in Poisson's equations. The diurnal [illegible]. The separated moments of inertia. Departures from rigid motion. Extension to great intervals of time. The luni-solar precession and nutation. Reduction to different constants of precession and nutation. Representation of the principal terms in literal form. Reduction to ecliptic of date and equator of date. True obliquity of date. Precession and nutation on ecliptic of date. Precession and nutation on equator of date. Motion of the axis of figure relative to the axis of rotation. Angular motion of the earth around the instantaneous axis.

Note: For approximately half [illegible] century astronomers have used the formulas for nutation and obliquity which were developed by Simon Newcomb and originally published in 1895. However these formulas are not accurate enough for present-day calculations of apparent positions of the stars. More precise [illegible] formulas have been constructed, based on [illegible] complete redevelopment of the dynamical theory of the motion of the earth about its center of mass. This volume is [illegible] detailed exposition of how this redevelopment was conceived and carried out. It is of interest to astronomers in general, and particularly to specialists in positional astronomy.

STARS

AITKEN ROBERT GRANT

New general catalogue of double stars within 120° of the North Pole. By Robert Grant Aitken, in succession to the late Eric Doolittle. Washington D C. Carnegie Institution of Washington 1932 2 v illus. 29 cm. (Carnegie Institution of Washington. Publication no. 417) $15.00. 634

Contents: Introduction. Abbreviations and references. Index. Table of [illegible]. List of corrections (1934)

Note: The catalogue gives the positions (for 1930 and for 1900) and all measures prior to 1927.0, except those listed or referred to in Burnham's *General catalogue of double stars within 121° of the North Pole, Washington, D.C., 1906*, for 17,184 stars. An eight-page pamphlet of additions and corrections was issued in 1934.

CAMPBELL, LEON AND LUIGI JACCHIA

The story of variable stars. Cambridge, Mass. Harvard University Press, 1941 226 p. illus. 22 cm. (The Harvard books on astronomy edited by Harlow Shapley and B J Bok) $3.50. 635

Contents How variables are found. Observing the variables. Using the observations. Pulsating stars. The red variables. Ex-

plosive stars. Erratic stars. Stellar eclipses. Epilogue. Addenda. Appendix. Index.

Note This book first introduces the reader to the technique of observation and then proceeds to analyze the present state of our knowledge about variable stars. Among the types of variable stars discussed are the explosive star or nova, the giant red variables, the "erratic" stars and eclipsing stars. The principles of spectroscopy and a few technical aspects of variable star astronomy are explained in the appendix which also includes a list of the brighter variables, Julian calendar and other useful tables.

CARNEGIE INSTITUTION OF WASHINGTON DEPARTMENT OF MERIDIAN ASTROMETRY

Albany catalogue of 20811 stars for the epoch 1910, prepared at the Dudley Observatory, Albany, New York, under the direction of Benjamin Boss director of the Department of Meridian Astrometry, Carnegie Institution of Washington Arthur J Roy, in charge of reductions of declinations and William B Varnum, in charge of reductions of right ascensions Washington, D C. Carnegie Institution of Washington, 1931 430 p 29 cm. (Carnegie Institution of Washington Publication no 419) $5 00 636

Contents Introduction. Right ascensions. Zenith distances. Catalogue. Appendix.

Note. This catalogue contains the positions of all stars brighter than magnitude 7.0 not observed at San Luis, supplemented by those stars fainter than magnitude 7.0 selected for inclusion in the *General catalogue of 33342 stars for the epoch 1950* Washington D.C., 1936–37 In addition, the observation of fundamental stars was extended southward to the zenith of San Luis to provide for an overlapping zone, common to Albany and San Luis, which might serve as a means of intercomparison.

physics of the [illegible]
in the high atmosphere, [illegible]ON OF WASHINGTON
outside the atmosphere, by [illegible]
polarization of the earth by A. [illegible]DIAN ASTROMETRY

MURRAY, RAYMOND SMITH

Frank Bradshaw Wood Princeton Published by the Observatory, 1951 117 p 32 cm. (Contributions from the Princeton University Observatory No 25) $3 00 638

Contents Introduction. RT Andromedae. WZ Andromedae. XZ Andromedae. AA Andromedae. SU Aquarii. ZZ Aurigae. UW Bootis. SV Camelopardalis. TT Ceti. U Coronae Borealis. RW Coronae Borealis. GO Cygni. 46 Eridani. RU Eridani. RW Geminorum. UV Leonis. RW Mon. EW Orionis. TY Pegasi. RT Persei. Y Piscium. AN Tauri. RW Ursae Majoris. AG Virginis.

Note: In this publication observed variations in light intensities for 24 systems of eclipsing variable stars are tabulated. The observations were made with the 23½ inch refractor and polarizing photometer of the Princeton University Observatory

FLINT, ALBERT STOWELL

Madison catalogue of 2786 stars for the epoch 1910 from meridian observations Reductions by Arthur J Roy Washington, D C. The Carnegie Institution of Washington 1939 57 p 30 cm. (Carnegie Institution of Washington. Publication no 515) $1.50 639

Contents. Introduction. Observing practice. Calibration. The tangent term e. Refractions. Magnitude equation. Micrometer contact corrections. Inclination of the zenith-distance thread. Probable errors. Reduction constants. Catalogue.

Note A catalogue of observations made at the Madison Observatory from 1912 to 1919 At least two observations of each star were made, and the catalogue contains positions of 2,401 relative stars and 385 standard stars. Data given are serial number General Catalogue number magnitude taken from the Harvard Catalogues, right ascension for 1910, precession and secular variation in right ascension, declination for 1910 precession and secular variation in declination, mean epoch of observation number of observations.

JENKINS, LOUISE F , compiler

General catalogue of trigonometric stellar parallaxes Compiled at the Yale University Observatory Printed with financial aid from U.N.E.S.C.O New Haven Yale University Observatory 1952 253 p. illus. 30 cm. $4.00 640

Note: A new catalogue prepared at the request of the president of Commission 24 of the International Astronomical Union and designed to supersede for trigonometric parallaxes, F Schlesinger's *General catalogue of stellar parallaxes*, second edition, New Haven, 1935. It is limited to trigonometric parallaxes from photographic plates. In its preparation, the longer trigonometric series of parallaxes from various observatories were compared. The techniques of comparison and results are described and summarized in the introduction to the volume. Essentially the following information is given for each star in the main table serial number DM number numbers in the Albany general catalogue (GC) or the Cincinnati catalogues, right ascension and declination for 1900 the visual or photographic magnitude spectral type proper motion; adjusted trigonometric parallax and its adjusted probable error references to original parallax values and notes on sources.

KOPAL, ZDENĚK

An introduction to the study of eclipsing variables. Cambridge Mass. Harvard University Press, 1946 220 p illus 23 cm. (Harvard Observatory monograph No 6) $4.00 641

Contents: Foreword, by H. N Russell. Nature of the eclipses. [illegible] of the elements. Improvement of preliminary elements and determination of limb-darkening. Effects of orbital eccentricity. The equilibrium of distorted stars. The effects of ellipticity. Theoretical light curves of close eclipsing systems. Determination of elements of distorted eclipsing

Note: A critical review of the current theory of eclipsing variables. It is mainly concerned with the interpretation of data collected by photometric means, and the treatment is largely mathematical. In the early chapters a simplified binary system in which two spherical components revolve around a common center of gravity is assumed in order to simplify the problem. In later chapters the effects of deviations from this simplified model are considered. Each chapter is accompanied by a partial annotated list of the related literature.

Merrill, John Ellsworth

Tables for solution of light curves of eclipsing binaries. Princeton: Published by the Observatory, 1950–53. 374 p. 30 cm. (Contributions from the Princeton Observatory, No. 23) 642

Note: These tables represent an extension and refinement of an earlier work initiated and published in 1912 by Henry N. Russell in *Astrophysical journal*, Volume xxxv, June 1912. They are designed as an aid to astronomers and astrophysicists in computing the orbits of double stars which eclipse each other at every revolution. The volume is published in seven consecutively paged parts which are entitled as follows: Coefficient of Limb-darkening, X = 0.0, X = 0.2, X = 0.4, X = 0.6, X = 0.8, X = 1.0, and Auxiliary tables.

Mikesell, A. H.

The scintillation of starlight. Washington, D.C.: Government Printing Office, 1955. 191 p. illus. 29 cm. (United States Naval Observatory. Publications. Second series. Vol. xvii, part iv) 643

Contents: Introduction. Personnel and Acknowledgments. Equipment. Reduction of observations. The observations. Discussion of the results. Polaris number. Summary of the results. References.

Note: The results of a program of observation of scintillation of starlight undertaken to measure the effects of scintillation on the accuracy of stellar photometry and to determine the meteorological causes are reported and discussed in this report. The apparatus used in the observations is described.

Mitchell, Samuel Alfred and others

The trigonometric parallaxes of six hundred and fifty stars, by S. A. Mitchell, D. Reuyl, and others. University, Va.: Leander McCormick Observatory, 1940. 749 p. 25 cm. (University of Virginia. Leander McCormick Observatory. Publications. Vol. 8) 644

Contents: Description of methods and measures. Statistics of the observations. Central magnitudes plotted against spectral type. Details of the parallax determinations. Numbers, dependences and magnitudes of the comparison stars. Summary.

Note: The tabular statements of data for each star in this volume are preceded by an excellent short discussion of the parallax observing technique and program at this observatory. The basic plan is to calculate the parallax of [illegible] on the basis of 30 photographic plates, these being taken in five successive seasons. In many instances cloudy weather holds up the movement, and the plates were spread over many seasons. Two previous publications of trigonometric parallaxes have been issued by this observatory. The first one gave the parallaxes of 360 stars and appeared as its Publications, Volume iii, and also as Ernest Kempton Adams Fund for Physical Research, Publications, Volume iii, 1930. The second, containing 442 parallaxes, appeared as its Publications, Volume iv, and also as National Academy of Sciences. Memoirs, Volume xxvi, 1, 1937.

Moore, Joseph Haines

A general catalogue of the radial velocities of stars, nebulae and clusters. Berkeley: University of California Press, 1932. 220 p. 30 cm. (University of California. Lick Observatory. Publications. Vol. xviii) $3.00 645

Contents: Introduction. Stellar radial velocities. Radial velocities of the gaseous nebulae [illegible] nebulae [illegible] clouds. Radial velocities of the globular clusters. Apparent radial velocities of the non-galactic nebulae.

Note: The catalogue was compiled in order to make generally available the data published after the appearance of the First and Second catalogues of J. Voute in 1921 and 1928, respectively. The closing date for this catalogue was January 1, 1932. Within this period, data on radial velocity had [illegible] rapidly because of the [illegible] of the [illegible] extended programs of observation. The arrangement of the material is tabular and is in general form that of previous extended lists dealing with this subject.

Morgan, H. R.

Catalog of 5,268 standard stars, 1950.0, based on the normal system N30. Washington, D.C.: Government Printing Office, 1952. 371 p. illus. 29 cm. (United States. Naval Observatory. Nautical Almanac Office. Astronomical papers prepared for the use of the American ephemeris and Nautical almanac. Vol. xiii, part iii) o.p. 646

Note: The present catalog is the result of a research program which was designed to correct the fundamental star catalogs so long in use with more recent observations. The program was necessary because of errors in the fundamental catalogs. The [illegible] "Several discussions of the errors in these catalogs have been made, and among other things it has been shown that the errors in the proper motions seriously affect the determination of the precession and solar motion, and the galactic [illegible] and other cosmic questions, many of which are of the same order of magnitude as the errors in the catalogs. The new catalog is based on a new fundamental system, 'The normal system,' which it has been felt was desirable and necessary to make, as an early independent catalog upon the subject. For this it has been possible to form a fundamental normal position, complete, independent of all previous work, and for an epoch much later than 1900. The list of [illegible] stars includes the FK3 and N30 (Backlund-Hough) stars, and other standard stars in GC, and 711 fainter stars not in GC. The stars are spaced fairly uniformly over the sky and positions for them have been taken from over seventy recent catalogs with mean epochs ranging from 1912 to 1952. About forty of these catalogs depend upon independent, or fundamental, observations, and the normal system is based upon these fundamental series. New numbers are assigned to the stars; however, the numbers in GC (Boss's *General catalog*) and in FK3 (*Dritter Fundamentalkatalog des Berliner Astronomischen Jahrbuchs*) are given, except of course in those cases where the stars are not in these earlier catalogs.

Oliver, Charles Pollard and others

Magnitudes and coordinates of comparison stars in 53 regions of variable stars and magnitudes of 284 variables. Philadelphia: University of Pennsylvania Press, 1940. 66 p. 31 cm. (Publications of the University of Pennsylvania. Astronomical series. Vol. v, part iii) $1.50 647

Note: The measurements given in tabular form in this monograph were made with the 18-inch refracting telescope of the Flower Astronomical Observatory. In the tables, when available, are the photometric magnitude, the average deviation of the separate results, number of nights the star was measured, the visual magnitude and the adopted magnitude, the last being a weighted mean. Comparison stars are designated by letters rather than by numerical magnitudes.

—— Magnitudes and coordinates of comparison stars in 35 regions of variable stars and magnitudes of other variables. Philadelphia: University of Pennsylvania Press, 1952. 98 p. 28 cm. (Publications of the Uni

versity of Pennsylvania. Astronomical series Vol VII part II) $3 00 647A

Note. A complementary work to the authors' *Magnitudes and coordinates of comparison stars in 32 regions of variable stars and magnitudes of 284 variables*, published in 1940 as Volume V part III of the same series. It contains the data derived from a considerable range of additional observations. Data given include the photometric magnitude, visual magnitude, and an adopted magnitude for each of the comparison stars. In addition, the booklet in hand contains a section entitled "Naked-eye variables in which observations made by Olivier over long period of years of the magnitude of selected variable stars are tabulated.

OLIVIER, CHARLES POLLARD, AND OTHERS

Magnitudes and coordinates of comparison stars in 35 regions of variable stars and magnitudes of other variables. Philadelphia University of Pennsylvania Press, 1952 98 p 28 cm. (Publications of the University of Pennsylvania. Astronomical series Vol VII, part II) $3 00 648

Note A complementary work to the authors' *Magnitudes and coordinates of comparison stars in 32 regions of variable stars and magnitudes of 284 variables*, published in 1940 as Vol. V part III of the same series. It contains the data derived from a considerable range of additional observations. Data given include the photometric magnitude visual magnitude, and an adopted magnitude for each of the comparison stars. In addition, the booklet in hand contains section entitled "Naked-eye variables in which observations made by Olivier over long period of years of the magnitude of selected variable stars are tabulated.

PAYNE GAPOSCHKIN, CECILIA

Stars in the making Cambridge, Mass. Harvard University Press, 1952 160 p illus. 25 cm. (The Harvard books on astronomy, edited by Harlow Shapley and Bart J Bok) $4 25 649

Contents Introduction Cosmic evolution. Part I, The players. Stars. Dust and atoms. Part II, The scene Pairs of stars. Clusters of stars. Systems of stars. Part III, The drama. The ages of things. The evolution of galaxies. The evolution of the stars. Suggestions for further reading. Index.

Note This book by an internationally famous contemporary astronomer is addressed to general readers and others who have nonspecialist interest in the stars. It presents vivid picture of what astronomers know at the present time about the behavior of stars and their evolution. The narrative is supplemented by 67 plates of reproductions of photographs of stars and galaxies. The bibliography is short, edited list of books suitable for the further enlightenment of nonspecialist readers.

PAYNE GAPOSCHKIN, CECILIA, AND SERGEI GAPOSCHKIN

Variable stars Cambridge Mass Harvard Observatory 1938 382 p illus 23 cm (Harvard Observatory Monographs No 5) $3.25 650

Contents (abridged) Introductory Geometric variables. Intrinsic variables. The cataclysmic variables. Extrinsic variables. On technique. Index of stars.

Note A survey of our present observational knowledge of variable stars as of 1938 embracing all known types of variable stars, including some that lie outside the galactic system. Instead of segregating the stars list types, the work attempts to build the various parts into coherent whole so that the theoretical worker may grasp the broad implications of the phenomenon in which he is interested. Each chapter gives general picture of the state of knowledge concerning the particular subject treated. An important part of the work is the lists of the well-established members of the groups list which the authors have classified the different types of variables. A large number of references to original works are given in footnotes.

PIERCE, NEWTON LACY

A finding list for observers of eclipsing variables Princeton Princeton University Observatory, 1947 63 p 31 cm. (Contributions from the Princeton University Observatory No 22) $6 40 651

Note A revised and enlarged edition of list first prepared by Professor R. S. Dugan. It is prepared specifically for professional astronomers, and its purpose is to provide information necessary for planning a worthwhile observing program. The introduction discusses the nature of data supplied, the reasons for observing these stars, and the methods and problems of observation. In the list itself, the left-hand pages contain data on position, period and character of light variation, spectral type, etc., to aid in the selection of stars to observe and the right-hand pages give means of identification, information about comparison stars and close companions, light elements, lists of observations and solutions. Information is included about observations known to be in progress.

ROBERTSON, JAMES

Catalog of 3539 zodiacal stars for the equinox 1950 0 Washington, D C. Government Printing Office, 1940 130 p illus. 29 cm. (United States Naval Observatory Nautical Almanac Office. Astronomical papers prepared for the use of the American ephemeris and nautical almanac. Vol. X, part II) $0.30 652

Contents Introduction Formation of the catalog. Explanation of the catalog. Comparisons with other catalogs. Catalog of 3,539 *zodiacal stars for the equinox 1950 0.*

Note. This catalogue was undertaken to meet the need of astronomers for a list of zodiacal stars including more stars and better places than those contained in Bedrick's *Catalogue of zodiacal stars (Astronomical papers of the American ephemeris,* Volume VIII, part III) published in 1905 A total of 3,539 stars, all within 8 of the ecliptic, is included. Of these stars, 313 are fainter than 8.5 magnitude.

ROSSITER, RICHARD ALFRED

Catalogue of southern double stars. Ann Arbor Observatory of the University of Michigan 1955 285 p 28 cm. (University of Michigan Observatory Publication. Vol. XI) 653

Note. This catalogue is record of the observations made in a 24 year program of observing and measuring double stars conducted at the Lamont Hussey Observatory of the University of Michigan at Bloemfontein, South Africa. The sky was searched from declination north 1 to the south pole except for the band south 70° 75° for stars to catalogue magnitude 9.5. More than 7,300 new pairs were found, and their measures along with others are presented in this volume.

RUSSELL, HENRY NORRIS, AND JOHN ELLSWORTH MERRILL

The determination of the elements of eclipsing binaries. Princeton Published by the Observatory 1952 96 p illus. 31 cm. (Contributions from the Princeton University Observatory No 26) $5 00 654

Contents Introduction. *The spherical model. Chapter III,* Part I, Nomographic solution Part II, Determination of the solutions. The rectifiable model. Intermediary solutions. Miscellaneous notes. Precepts for the computer

Note A complementary work to Merrill, *Tables for solutions of light curves of eclipsing binaries,* described above, and to Merrill, *Nomographs for solution of light curves of eclipsing variables,* published in 1953 at Number XXIV of the same series. It is presentation of the theory and computational techniques useful in the analysis of eclipsing binary phenomena and in the compilation

of such aids as the tables and nomographs just mentioned. The third chapter on nomographic solutions is of special interest and this is the first publication of the method.

SCHLESINGER FRANK AND LOUISE F JENKINS

Catalogue of bright stars, containing all important data known to January 1940 relating to all stars brighter than 6.5 visual magnitude, and to some fainter ones. Second edition. With appendices containing galactic co-ordinates and indices to the constellations. New Haven Yale University Observatory 1940. 213 p. 31 cm. $3.00. 655

Note These tables give the following information relative to the bright stars of the indicated magnitude: current number, which is the Revised Harvard photometry number as well, the constellation name, with the Flamsteed number and the Bayer letter; the Durchmusterung number; the number of the star in Boss's *General catalogue of 33,342 stars for the epoch 1950* (Washington, D.C., Carnegie Institution of Washington Publication 468, 1937); the right ascension for 1900 and the annual variation in right ascension for 1950; the declination for 1900 and the precession in declination for 1950; the magnitude and the spectrum; the proper motions in right ascension and declination expressed in seconds of arc; the absolute parallax, the radial velocity and additional remarks relating mostly to characteristics of double stars. The second edition contains appendices giving the galactic longitude and latitude corresponding to given right ascension and declination; the intersectional limits of the constellations, modified so that every boundary is either [illegible] meridian or [illegible] circle of declination; abbreviations for constellation names in the three- and four-letter international symbols; an index to the right ascensions (1900) of stars given by their Bayer letters or Flamsteed numbers, and an index to the positions of stars having specific names.

SCHLESINGER, FRANK AND OTHERS

Catalogue of the positions and proper motions of 8359 stars. Re-observation by means of photography of the Astronomische Gesellschaft zone between declinations + 50 and + 55 With an appendix containing the position of 1070 comparison stars observed by R. H. Tucker with the Lick meridian circle. By Frank Schlesinger and Ida Barney New Haven Published by the Observatory 1925 183 p. 31 cm. (Yale University Astronomical Observatory Transactions. Vol. 4) $3.00 656

—— Catalogue of the positions and proper motions of 1275 stars. Re-observation by means of photography of the Astronomische Gesellschaft zone between declinations + 1 and + 2 by Frank Schlesinger C. J Hudson Louise Jenkins, and Ida Barney New Haven Published by the Observatory 1926 16 p. 31 cm. (Yale University Astronomical Observatory Transactions. Vol. 3 p. 135–151) $0.30 657

—— Catalogue of the positions and proper motions of 7727 stars. Re-observation by means of photography of the Astronomische Gesellschaft zone between declinations + 55 and + 60° reduced to 1875.0 without applying proper motions. With an appendix containing the positions of 396 stars in sparse regions, and an appendix containing the positions of 80 additional Gesellschaft stars near declination + 55 By Frank Schlesinger and Ida Barney New Haven Published by the Observatory 1930. 165 p. 31 cm. (Yale University Astronomical Observatory Transactions, Vol 7) $3.60 658

—— Catalogue of the positions and proper motions of 8101 stars. Re-observation by means of photography of the Astronomische Gesellschaft zone between declinations — 10 and — 14 reduced to 1950.0 without applying proper motions. By Frank Schlesinger and Ida Barney New Haven Published by the Observatory 1939 164 p 31 cm. (Yale University Astronomical Observatory Transactions. Vol. 11) $3 75 659

—— Catalogue of the positions and proper motions of 8563 stars. Re-observation by means of photography of the Astronomische Gesellschaft zone between declinations — 14 and — 18 reduced to 1950 0 without applying proper motions By Frank Schlesinger and Ida Barney New Haven Published by the Observatory 1940 173 p. 31 cm. (Yale University Astronomical Observatory Transactions Vol 12 part 1) $5 00 for Vol. 12 complete 660

—— Catalogue of the positions and proper motions of 4553 stars. Re-observation by means of photography of the Astronomische Gesellschaft zone between declinations — 18 and — 20 reduced to 1950.0 without applying proper motions. By Frank Schlesinger and Ida Barney New Haven Published by the Observatory 1940. 93 p. 31 cm. (Yale University Astronomical Observatory Transactions. Vol. 12 part 2) $5.00 for Vol. 12 complete. 661

—— Catalogue of the positions and proper motions of 4292 stars. Re-observation by means of photography of the Astronomische Gesellschaft zone between declinations — 20° and — 22 reduced to 1950.0 without applying proper motions. By Frank Schlesinger and Ida Barney New Haven Published by the Observatory 1943 87 p. 31 cm. (Yale University Astronomical Observatory Transactions. Vol. 13 part 1) $5.00 for Vol. 13 complete. 662

—— Catalogue of the positions and proper motions of 9455 stars Re-observation by means of photography of the Astronomische Gesellschaft zone between declinations — 27° and — 30°, reduced to 1950 0 without applying proper motions By Frank Schlesinger and Ida Barney New Haven Published by the Observatory, 1943 191 p 31 cm (Yale University Astronomical Observatory Transactions Vol 13, part 2) $5 50 for Vol 13 complete 663

—— Catalogue of the positions and proper motions of 15110 stars. Re-observation by means of photography of the Cordoba zone between declinations — 22° and — 27°, reduced to 1950 0 without applying proper motions By Frank Schlesinger and Ida Barney New Haven Published by the Observatory, 1943 304 p 31 cm (Yale University Astronomical Observatory Transactions Vol. 14) $5 50 664

—— Catalogue of the positions and proper motions of 8248 stars Re-observation by photography of the Astronomische Gesellschaft zone between declinations — 6° and — 10 , reduced to 1950 0 without applying proper motions By Ida Barney New Haven Published by the Observatory, 1945 169 p 31 cm (Yale University Astronomical Observatory Transactions. Vol 16) $3 50 665

—— Catalogue of the positions and proper motions of 8108 stars. Re-observation by photography of the Astronomische Gesellschaft zone between declinations — 2° and — 6° reduced to 1950 0 without applying proper motions By Ida Barney New Haven Published by the Observatory 1945 166 p 31 cm (Yale University Astronomical Observatory Transactions Vol 17) $3 50 666

—— Catalogue of the positions and proper motions of 9092 stars Re-observation by photography of the Astronomische Gesellschaft zone between declinations + 15° and + 20 , reduced to 1950 0 without applying proper motions By Ida Barney New Haven Published by the Observatory 1947 187 p 31 cm (Yale University Astronomical Observatory Transactions. Vol 18) $4 50 667

—— Catalogue of the positions and proper motions of 8967 stars Re-observation by photography of the Astronomische Gesellschaft zone between declinations + 10° and + 15°, reduced to 1950 0 without applying proper motions By Ida Barney New Haven Published by the Observatory, 1948 185 p 31 cm (Yale University Astronomical Observatory Transactions Vol 19) $4.50 668

—— Catalogue of the positions and proper motions of 7996 stars Re-observation by photography of the Astronomische Gesellschaft zone between declinations + 1° and + 5°, reduced to 1950 0 without applying proper motions By Ida Barney New Haven Published by the Observatory, 1949 164 p 31 cm. (Yale University Astronomical Observatory Transactions. Vol. 20) $3.50 669

—— Catalogue of the positions and proper motions of 5583 stars Re-observation by photography of the Astronomische Gesellschaft zone between declinations — 2° and + 1°, reduced to 1950 0 without applying proper motions By Ida Barney New Haven Published by the Observatory, 1950 116 p. 31 cm. (Yale University Astronomical Observatory Transactions. Vol 21) $2 50 670

—— Catalogue of the positions and proper motions of 9060 stars. Re-observation by photography of the Astronomische Gesellschaft zone between declinations + 5° and + 1°, reduced to 1950 0 without applying proper motions By Ida Barney New Haven Published by the Observatory 1950 185 p 31 cm (Yale University Astronomical Observatory Transactions Vol 22 part I) $5 40 for Vol 22 complete 671

—— Catalogue of the positions and proper motions of 1904 stars Re-observation by photography of the Astronomische Gesellschaft zone between declinations + 9 and + 10 reduced to 1950 0 without applying proper motions By Ida Barney New Haven Published by the Observatory 1950 41 p. 31 cm. (Yale University Astronomical observatory Transactions. Vol 22 part II) $5 40 for Vol 22 complete 672

—— Supplementary volume to the Yale zone catalogues — 30 to + 30 By Ida Barney New Haven Published by the Observatory 1951 106 p. 31 cm (Yale University Astronomical Observatory Transactions Vol. 23) $2 50 673

Contents Introduction. Section A Zone catalogue, —6 to —10° Supplementary to Volume XVI. Section B Zone catalogue, —2 to —6 Supplementary to Volume XVII. Section C Spectral types, +15 to +20 Supplementary to Volume XVIII Section D Spectral types, +10 to +15 Supplementary to Volume XIX. Section E. Proper motion for fundamental stars, —30 to +30 Section F Proper motions, +1 to +5 Supplementary to Volume XX.

Section 0. Comparison with the general Catalogues of Yale positions and proper motions, −30° to +30°. Comparison of positions and proper motions in overlapping regions. Section 11. Errata for Yale zone catalogues, −30° to +30°

—— Revised catalogue of the positions and proper motions of 10358 stars. Contained in the Astronomische Gesellschaft zone between declinations +25 and +30 on the system of the FK3 and reduced without applying proper motions to the equinox 1950.0. By Ida Barney. New Haven. Published by the Observatory. 1953. 209 p. 31 cm. (Yale University Astronomical Observatory. Transactions. Vol. 24) $5.00 674

—— Revised catalogue of the positions and proper motions of 8703 stars. Contained in the Astronomische Gesellschaft zone between declinations +20 and +25 on the system of the FK3 and reduced without applying proper motions to the equinox 1950.0. By Ida Barney. New Haven. Published by the Observatory. 1954. 176 p. 31 cm. (Yale University Astronomical Observatory. Transactions. Vol. 25) $4.25 675

—— Catalogue of the positions and proper motions of 1031 stars. Between declinations +85 and +90° reduced without applying proper motions to the equinox. By Ida Barney and A. J. J. Van Woerkom. New Haven. Published by the Observatory. 1954. 44 p. 30 cm. (Yale University Astronomical Observatory Transactions. Vol. 26 pt. 1) 676

Note: In 19[illegible] the late Dr. Frank Schlesinger started experiments at Allegheny Observatory on the use of photography in the making of star catalogs, and his results became interested in the compilation of zone catalogs on the pattern of those produced under the auspices of the Astronomische Gesellschaft. After he moved to the Yale University Observatory the work was continued, and publication of this monumental catalog was commenced. After Dr. Schlesinger's death in 1943, the work was carried on by his associate, Dr. Ida Barney. The original catalog +30° to −30° is complete with the part published in 1950. The supplementary volumes contain supplementary data to the particular volumes noted in the Contents listed above, and corrections of errors for all volumes of the original catalog. The last entry in the series represents a catalog of the zone +85° to +90° which was based on measurements of four plates taken on [illegible] of a new eight-inch Ross camera acquired by the Yale Observatory. It includes nearly all stars brighter than photographic magnitude 11.6 as well as some fainter stars in the region centered on the celestial north pole.

SEARES FREDERICK HANLEY AND OTHERS

Magnitudes and colors of stars north of +80 by Frederick H. Seares, Frank E. Ross and Mary C. Joyner. Washington, D. C. Carnegie Institution of Washington. 1941. 89 p. illus. 29 cm. (Carnegie Institution of Washington. Publication no. 532) $2.00 677

Contents: Introduction. Relation of various catalogues to international system. Provisional secondary standards. Recent photographic observations. Measurement and reduction of photographs. Tests and provisions of provisional secondary standards. Reduction of program photographs for Pg magnitudes. Reduction of program photographs for Pv magnitudes. Final reduction formulae for Pv catalogues. Uniformity of zero points. Relation of catalogue to international system. Description of the catalogue. Catalogue of magnitudes and colors. Notes to the catalogue.

Note: The catalogue provides an extension of the Polar sequence, for the most part comparable in precision with the international standards themselves. An introduction to the catalogue describes in detail the successive steps of the investigation.

SEARES FREDERICK HANLEY AND OTHERS

Mount Wilson catalogue of photographic magnitudes in selected areas 1–139 by F. H. Seares, J. C. Kapteyn and P. J. van Rhijn. Assisted by Mary C. Joyner and Myrtle L. Richmond. Washington D. C. Carnegie Institution of Washington. 1930. 276 p. 29 cm. (Carnegie Institution of Washington. Publication no. 402) $9.00. 678

Note: The catalogue gives magnitudes for stars in the 139 areas on and north of the declination parallel at −15° and is arranged in the serial order of the areas. The results for each area are divided between a main list, which gives mean magnitudes of all stars within the limits of the field adopted at Groningen, and a supplementary list, which includes all stars outside the Groningen field and hence measured only at Mount Wilson. The total number of stars in the main and supplementary lists is 44,926 and 23,015 respectively or 67,941 in all. The catalogue is based on 1,063 photographic plates made between 1909 and 1912. Right ascension and declination as of 1900 are given for each star.

SHAPLEY HARLOW

Galaxies. Cambridge Mass. Harvard University Press. 1943. 229 p. illus. 22 cm. (The Harvard books on astronomy, edited by Harlow Shapley and B. J. Bok) $3.50 679

Contents (abridged): Galactic explorations. The star clouds of Magellan. The astronomical yardstick. The Milky way as a galaxy. The neighboring galaxies. The metagalaxy. The expanding universe.

Note: A popularized scientific discussion which tells the story of the observation, interpretation, and measurement of those distant stellar organizations that lie beyond the Milky Way. There are numerous illustrations, including photographs of modern astronomers who have done outstanding work in this field. There is an index.

VAN BIESBROECK GEORGES VAN

Measurements of double stars. Chicago University of Chicago Press, 1936. 51 p. 30 cm. (Chicago University. Yerkes Observatory Publications. Vol. VIII, part II) o.p. 680

—— Measurements of double stars. Chicago University of Chicago Press, 1954. 223 p. 30 cm. (Chicago University. Yerkes Observatory Publications. Vol. VIII part VI) $10.00 680A

Note: These volumes constitute the most comprehensive record available of measurements of double stars. The author is among the world's most eminent authorities on double stars, and the measurements presented are the results of observations and measurements which have been conducted over three decades at Yerkes Observatory.

VAN DE KAMP P AND A. N. VYSSOTSKY

A study of the proper motions of 18,000 stars, derived at the Leander McCormick Observatory. Charlottesville. University of Virginia, 1937. 246 p. illus. 30 cm. (Publications

of the Leander McCormick Observatory of the University of Virginia. Vol VII) $1 00 681

Contents Material and measures. General solution for solar motion differential galactic rotation and precessional constants. Solar apex for separate magnitude and spectral groups. Distribution f total proper motions and absolute magnitudes density gradients relative to the galactic plane. Ellipsoidal distribution of stellar motions. Secular parallaxes, tau-components and mean parallaxes. Absorption f light within the galaxy Appendices. Explanation of the catalogue. Catalogue of proper motions.

Note The present work and that by Vyssotsky and Williams described below are complementary to one another See the listing f the second work for the descriptive note.

VYSSOTSKY, A N , AND EMMA T R. WILLIAMS

An investigation of stellar motions, together with second McCormick catalogue of proper motions Charlottesville Leander McCormick Observatory of the University of Virginia, 1948 214 p illus 28 cm. (Leander McCormick Observatory of the University of Virginia. Publications Vol x) $1 00 682

Content The McCormick proper motion catalogues, by A. N Vyssotsky and E. T R. Williams. The magnitudes f the second McCormick catalogue, by E. R. Dyer Jr Reduction of the Cape photographic proper motions to the FK3 system, by E. T R. Williams. The constants of solar motion, precession, and galactic rotation as derived from McCormick and Cape proper motions, by E. T R. Williams and A. N Vyssotsky On the systematic errors introduced by rejecting large motions, by E. T R. Williams. The constants of galactic rotation and precession, by E. T R. Williams and A. N Vyssotsky McCormick spectral statistics according to galactic longitude, by A. N Vyssotsky and E. T R. Williams. Secular parallaxes, luminosity distribution, and distances for stars of ninth to eleventh magnitudes, by A. N Vyssotsky and E. T R. Williams. The variation of the solar motion with spectral class, by A. N Vyssotsky and E. T R. Williams. Peculiar motions, by E. T R. Williams and A. N Vyssotsky Second catalogue of proper motions. Errata for first catalogue. Appendices.

Note. These two catalogues contain the proper motions and photovisual magnitudes of 29,000 stars in 782 small-sample regions of the sky scattered from the North Pole to declination −30° and covering about 400 square degrees in all. Spectral classification is given for 14,000 of the stars. The second catalogue contains more regions than the first and more stars with known spectra, whereas the first contains more stars fainter than 11 magnitude The accuracy of the motions is somewhat better in the second Catalogue. Corrections are given to reduce the motions in each region to the system of the FK3 Methods are described and errors evaluated in detail. Preceding the catalogue in Volume x of Publications are 10 papers whose uthors and titles are listed in the above Contents.

WILSON, RALPH ELMER

General catalogue of stellar radial velocities. Prepared at the Mount Wilson Observatory, Pasadena, California. Washington, D C Carnegie Institution of Washington 1953 344 p 28 cm. (Carnegie Institution of Washington Publication 601 Mount Wilson Observatory Papers Vol VIII.) $2.85 683

Contents Introduction. Catalogue. Notes. A partial bibliography of radial velocity stars.

Note. A successor to J H. Moore, *A general catalogue of the radial velocities f stars, nebulae and clusters*, Berkeley 1932 It gives the velocities of 15 107 stars, including the hitherto unpublished velocities of about 1,000 stars, and presents all the data available to the author up to January 1951 In the catalogue proper single best value f the radial velocity which is a weighted mean of all the observations reduced to a standard system, is presented. Separate, uncorrected values for all stars with two or more sets of observations are given in the "notes, together with identifications of the sources.

PHYSICS

GENERAL

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

The present state of physics. A symposium presented on December 30 1949 at the New York meeting of the American Association for the Advancement of Science. Arranged by Frederick S. Brackett. Washington D C. American Association for the Advancement of Science, 1954 265 p. illus. 23 cm. $6 75 634

Contents: Elementary particles. The magnetic moment of the electron, by P. Kusch. Cosmic ray experiments at high altitude, by E. P. Ney. Developments in cosmic radiation, 1945-1950, by J. C. Street. Physics of the solid state. The new dielectrics, by K. Lark-Horovitz. Flow of electrons and holes in semiconductors, by J. Bardeen. Nuclear theory [illegible], by A. von Hippel. Chemical physics. The structure of polymers, by P. J. W. Debye. Implications of the chemical kinetics of some biological systems, by R. Lumry and H. Eyring. Biophysics. Some physical and chemical properties of nerve related to conduction of nerve impulses, by F. Brink, Jr. Bioluminescence and the theory of reaction rate control in living systems, by F. H. Johnson. Index.

Note: In this book a group of eminent scientists review the progress made in several branches of physics up to 1949. The authors, all of whom have made substantial contributions in their respective fields, wrote primarily for scientific specialists in other fields. The papers range in length from the 10 pages on "The magnetic moment of the electron" to the 72-page paper "The new dielectrics," by Lark-Horovitz. In most cases, bibliographies are included.

BRIDGMAN PERCY WILLIAMS

The nature of physical theory. Published on the Louis Clark Vanuxem Foundation. New York Dover Publications, 1936 138 p. 21 cm. $1.25 685

Contents: Introductory. Operations. Thought, language, Logic. Mathematics. Mathematics in application. Reality. Mathematical models and probability. Wave mechanics. In conclusion. Index.

Note: A book of essays by an eminent American experimental physicist. It had its origin in Vanuxem lectures delivered at Princeton University in 1936; however, the lectures were revised and expanded for publication in the book. They deal with some of the concepts of physics that were current in the 1930's. These concepts are explained in simple terms, and their significance interpreted for the [illegible] by teachers and physicists interested in the methodology and philosophy of physics. The first edition was published by the Princeton University Press in 1936. The edition listed here is apparently a reprint with no changes in text.

BRIDGMAN PERCY WILLIAMS

Reflections of a physicist. New York Philosophical Library 1955 576 p. 22 cm. $6.00 686

Contents: General points of view: Operational analysis. Some general principles of operational analysis. Science—public or private. Freedom and the individual. On "Scientific method." Some implications of recent points of view in physics. The operational aspect of meaning. Science and common sense. Remarks on the present state of operationalism. Applications to scientific situations: The new vision of science. Permanent elements in the flux of present-day physics. The recent change of attitude toward the law of cause and effect. Statistical mechanics and the second law of thermodynamics. The time scale. On the nature and limitations of cosmical inquiries. Einstein's theories and the operational point of view. Impertinent reflections on history of science. Primarily social: The struggle for intellectual integrity. Society and the intelligent physicist. Science, and its changing social environment. Scientists and social responsibility. Science and freedom—reflections of a physicist. The strategy of the social sciences. Science, materialism and the human spirit. The dilemma of science. The task before us. Specific situations: "Manifesto" by a physicist. A challenge to physicists. Scientific freedom and national planning. Sentimental democracy and the forgotten physicist. Prophetic. The prospect for intelligence. New vistas for intelligence. Index.

Note: The first edition of this collection of nontechnical writings by a leading American physicist was published in 1950. The additions include several more essays on the operational method, an important concept in the philosophy of science. In some of the new papers the author explores the implications of operational analysis in fields of science other than physics.

CHASE CARL TRUEBLOOD

The evolution of modern physics. New York D Van Nostrand Company Inc., 1947 203 p. illus. 21 cm. $4.00. 687

Contents: Energy and atoms. Physics becomes experimental. Light waves. Heat and energy. Molecules. Magnetism and electricity. From Maxwell to radio. Cathode rays and X-rays. Radioactivity. The Rutherford atom. The quantum theory. Spectroscopy and the Bohr atom. The experimental basis of relativity. Michelson and the velocity of light. The electron. Protons. Electron waves. Wave mechanics. The atomic nucleus. The release of atomic energy. Index.

Note: This review of the highlights in the progress of physics from the time of Thales of Miletus to the present, will be of interest to the layman and the science student. The author has traced these developments by emphasizing researches and discoveries which are considered landmarks in the history of physics. He has based the book on his earlier work, *A history of experimental physics*, New York, 1932, but the original material has undergone much rewriting and some condensation. Although the arrangement is largely chronological, "continuity" has been obtained by grouping together related topics and discoveries. The book contains full-page plates illustrative of recent physical advances.

DONNAN FREDERICK GEORGE AND ARTHUR HAAS editors

A commentary on the scientific writings of J. Willard Gibbs, formerly Professor of Mathematical Physics in Yale University, edited by F G Donnan and Arthur Haas New Haven Yale University Press 1936 2 v illus. 23 cm. $12.00. 688

Contents (abridged): Volume 1: The general thermodynamic system of Gibbs, by J. A. V. Butler. Osmotic and membrane equilibria, including electrochemical systems, by F. A. Donnan. The phase rule and heterogeneous equilibrium, by G. W. Morey. The graphical representation of equilibria in binary systems by means of the zeta (free energy) function, by F. A. H. Schreinemakers. The conditions of equilibrium for heterogeneous masses under the influence of gravity, by D. H. Andrews. The thermodynamics of strained elastic solids, by J. Rice. The influence of surfaces of discontinuity upon the equilibrium of heterogeneous masses, by J. Rice. The general properties of perfect electrochemical apparatus, by H. S. Harned. Index. Volume II: The thermodynamic principles as extended and perfected by Gibbs, by Arthur Haas. Application of Gibbs' methods to modern problems of thermodynamics, by Paul S. Epstein. Gibbs' contributions to the theory of light, by Leigh Page. The contributions of Gibbs to vector analysis and multiple algebra, by Edwin B. Wilson. Gibbs and the statistical conception of physics, by Arthur Haas. The chief results of Gibbs' statistical mechanics, by Arthur Haas. Critical appreciation of Gibbs' statistical me-

chanics, by Paul S. Epstein. Gibbs' methods in quantum statistics, by Paul S. Epstein. Commentary on Gibbs' papers on dynamics, by Arthur Haas. Indexes.

Note The main purpose of these two volumes is to aid and supplement a careful study of the original text of Gibbs' writings and not to make such study unnecessary Each of the two volumes deals with the portion of Gibbs' writings contained in the *Collected works J J Willard Gibbs*, New York, 1928. Volume I of the present work is essentially interpretative and explanatory but includes a discussion of recent developments concerning Gibbs' thermodynamic principles and many examples, drawn from modern literature of their application to concrete problems. Volume II contains an analysis, appreciation, and interpretation of Gibbs work in the field of theoretical physics, especially his statistical mechanics and their relation to modern quantum statistics. The volumes are separately indexed and may be used independently

HEATHCOTE, NIELS H DE V

Nobel prize winners in physics 1901–1950 With a foreword by Prof Herbert Dingle. New York Abelard-Schuman, Ltd., 1953 437 p 23 cm. $8 50 689

Note Organized on the same pattern as E. Farber *Nobel prize winners in chemistry* New York, 1953 this volume provides elementary biographical information on the 57 scientists to whom Nobel prizes in physics were awarded in the half-century designated in the book's title. The descriptions of the scientists' discoveries for which the prizes were awarded are substantially longer than in the chemistry volume and there are accordingly many more entries in the indexes. These differences account for the greater length of this book.

THE INTERNATIONAL DICTIONARY OF PHYSICS AND ELECTRONICS Princeton D Van Nostrand Company, Inc., 1956 1 004 p 26 cm $20 00 690

Note A reference book of major importance. It covers the terms in both classical and modern physics, not only the single words but also a selection of the abbreviations and longer terms. An example of the last-mentioned is "Electrode of the second order" Definitions range in length from a few words to several columns and are written in the terminology of physics. Pictorial illustrations are not major feature, but there are several hundred of them. The work was prepared under the direction of 15 American and British scientists, with Walter C. Michels as senior editor

LINDSAY, ROBERT BRUCE, AND HENRY MARGENAU

Foundations of physics New York John Wiley & Sons, Inc, 1936 537 p illus 23 cm. 691

Contents The meaning of physical theory Space and time in physics. The foundations of mechanics. Probability and some of its applications. The statistical point of view The physics of continua. The electron theory and special relativity The general theory of relativity Quantum mechanics. The problem of causality Index.

Note A successful treatment of the basic concepts and methods of physics. It examines critically and in some detail such matters as the nature of physical laws, space the Newtonian postulates for mechanics, Hamilton's principle, physical applications of probability theory statistical mechanics, relativity the axiomatic foundation of quantum mechanics and Schrödinger's equation. Although mathematics is used in the exposition, physical concepts and reasoning are employed whenever possible. The first edition, 1937 listed above is out of print. A reprint of the first edition containing the original text with minor revisions and new selected list of books for further reading was published by Dover Publications, New York 1957 $2 45

MARGENAU, HENRY

The nature of physical reality a philosophy of modern physics. New York McGraw Hill Book Company, Inc., 1950 479 p. illus. 24 cm. $7 00 692

Contents (abridged) Ways of arriving at reality What is immediately given? Departure from the immediate—constructs. Metaphysical requirements of constructs. Empirical confirmation. Space and time. Systems, observables, and states. Physics of discrete systems. Physics of continua. Thermodynamics. The role of definitions in science. Probability Statistical mechanics. The breakdown of physical models. Basic ideas of quantum mechanics. Uncertainty and measurements. Causality The exclusion principle. The contours of reality Name index. Subject index.

Note A significant contribution to the philosophy of science The author states that he believes the attitudes of uncritical realism, unadorned operationalism and radical empiricism which pervade most of the discussion and much of the thinking on subjects of science, to be outmoded and in disharmony with the successful phases of contemporary physics. He defines reality in terms of "verifacts, which derive their validity from systems of experience rather than from the "pointer readings" of operationalism. The book is addressed more to physicists than to philosophers, but it does contain thought of interest to the latter group too. It is arranged for use as textbook in college courses, but it can be read independently by any reader who has a basic understanding of philosophical and physical terminology

RIDENOUR, LOUIS N , editor

Modern physics for the engineer New York McGraw Hill Book Company, Inc., 1954 499 p illus 23 cm. $8 00 693

Content Part 1 *The laws of nature* Relativity and the foundations of mechanics, by H. P Robertson. Atomic structure, by L. I Schiff Physics of the solid state, by F Seitz. Magnetism, by C. Kittel. Microwave spectroscopy by W D Hershberger Nuclear structure and transmutation by W A. Fowler Electronuclear machines, by R. V Langmuir The actinide elements and nuclear power by G. T Seaborg. Elementary particles, by W K. H. Panofsky Part 2 Man's physical environment Astrophysics, by J L. Greenstein. High-pressure phenomena with applications to geophysics, by D T Griggs. The earth beneath the sea—geophysical exploration under the ocean, by R. Revelle. Thunderstorms and lightning strokes, by L. B. Loeb Transient phenomena in supersonic flow by W Bleakney Part 3 Information and its communication. Electrons and waves, by S. Ramo. Semiconductor electronics, by J Bardeen. Communication theory and the transmission of information by J B. Wiesner Computing machines and the processing of information, by L. N Ridenour Name index. Subject index.

Note Lectures delivered in an extension course offered to graduate engineers in 1952–1953 by the University of California at Los Angeles have been published in this book. The titles and authors are listed above. The chapters are independent of one another except for having been prepared for the same audience. The book is, therefore, useful to readers in need of an authoritative survey of one or more of the topics covered. It can also be read as a panoramic, although not comprehensive, view of modern developments in theoretical and applied physics. The chapters are illustrated and equipped with references to the literature.

WHITFORD, ROBERT H.

Physics literature a reference manual. New York The Scarecrow Press 1954 228 p 22 cm $5 00 694

Content Introduction. Bibliographical approach. Historical approach. Biographical approach. Experimental approach. Mathematical approach. Educational approach. Terminological approach. Additional approaches. Topical approach. General summary General bibliography Author index. Subject index.

Note A useful bibliographical guide to physics literature, including bibliographies, indexes, reference books, and selected treatises and textbooks. The main arrangement is by "approach, or in other words, purpose. Thus books and other publications whose viewpoint is primarily bibliographical are covered in the chapter entitled, "Bibliographical approach, and compilations of *mathematical tables* and mathematical treatises are considered in the chapter entitled "Mathematical approach. The chapter entitled Additional approaches" covers books on lecture demonstrations, on the art of writing, guides to scientific films, etc. The chapters begin with short comments by the author and, in addition, brief annotations are attached to groups of entries and sometimes to individual entries. The volume is adequately indexed.

HISTORY

ABRO A. D

The rise of the new physics its mathematical and physical theories. Formerly titled "Decline of mechanism." In two volumes. New York Dover Publications Inc., 1951 982 p. illus. 23 cm. $1 95 per vol. 695

Contents Part I, General considerations. The historical background of the scientific method. Assumptions in science. The significance of theoretical physics. Two kinds of simplicity. Successful theories of mathematical physics and premature approximations. Conceptual changes in physical theories. Causality. Continuity. Mechanistic theories. Field theories. Phenomenological theories. A retrospect on the different kinds of theories. Psychological differences among physicists. Part II, Physical theories of the classical period. Mathematical preliminaries. Differential equations. The controversies on the nature of mathematics. Analytical mechanics. Maximal principles and principles of action. The undulatory theory of light. Transformations. Thermodynamics. The classical kinetic theory of gases. Part III, The quantum theory: The relativity and the quantum theories. Planck's original quantum theory. Generalities on the atom. Bohr's atom. Applications of Bohr's theory. De Broglie's wave-mechanics. Heisenberg uncertainty principle. Vibrations. Schrödinger's wave mechanics of the atom. Schrödinger's theory of radiation. Bohr' interpretation of Schrödinger' theory. The helium atom. Matrices. The matrix method. Dirac theory of the electron. The new statistics. Quantum mechanics and causality. Index.

Note A comprehensive account of the historical growth and present state of the new ideas and theories of mathematical physics. The mathematical side of the subject is covered at some length, but the author has arranged the book so that readers without mathematical education can omit certain chapters but [illegible] follow the argument. This [illegible] reprint of Decline of mechanism, New York, D Van Nostrand Company 1939 here issued in two volumes which are continuously paged.

CROSBY, H. LAMAR JR. editor

Thomas of Bradwardine his *Tractatus de proportionibus* its significance for the development of mathematical physics Edited and translated by H. Lamar Crosby jr Madison University of Wisconsin Press 1955 203 p. 24 cm. $3.50 696

Contents (abridged) Introduction. Editions and manuscripts. The general significance of the *De Proportionibus*. Description and critical analysis. Thomas Bradwardine *Tractatus proportionum seu de proportionibus velocitatum in motibus*. Sigla. Variant readings. Appendix. Notes. Bibliography. Index.

Note This book is one of [illegible] series of texts and critical studies in the history of the physical sciences being published by the University of Wisconsin Press. Seventy-eight of its pages are devoted to Latin text and an English translation of the *Tractatus de proportionibus* of Thomas of Bradwardine. Complementing these and occupying about 120 pages are [illegible] discussion by the editor of the general significance of the work in the stream of scientific thought, detailed description and critical analysis of it, notes and [illegible] bibliography

JAMMER, MAX

Concepts of space the history of theories of space in physics. Foreword by Albert Einstein. Cambridge, Mass. Harvard University Press 1954 196 p. 22 cm. $3 75 697

Contents Introduction. The concept of space in antiquity. Judeo-Christian ideas about space. The emancipation of the space concept from Aristotelianism. The concept of absolute space. The concept of space in modern science. Index.

Note A scholarly, well-documented account of the concept of space from the standpoint of physics rather than metaphysics. It traces the historical evolution of the physical concept of space, analyzes the leading theories and relates them to other areas of physics. Some attention is given also to relations to mathematics. Literary citations are printed as footnotes. The index includes authors' names only, both those mentioned in the text and those whose works are cited.

MAGIE, WILLIAM FRANCIS

A source book in physics. New York McGraw Hill Book Company Inc., 1935 620 p. illus. 23 cm. (Source books in the history of the sciences G D Walcott, general editor) $9.00 698

Contents (abridged): General editor' preface. Author's preface. Mechanics. Properties of matter. Sound. Heat. Light. Magnetism and electricity. Index.

Note This book makes accessible the most significant portions of the original papers in which scientific workers announced important discoveries or methods of thought in the field of physics. The period covered is the three centuries ending with the year 1900 A.D. Although these extracts are chiefly concerned with experimental work, mathematical papers are occasionally quoted. Brief biographical sketches of the authors are included.

MOODY, ERNEST A., AND MARSHALL CLAGETT

The medieval science of weights (Scientia de ponderibus) Treatises ascribed to Euclid Archimedes Thabit ibn Qurra Jordanus de Nemore and Blasius of Parma. Edited with introductions, English translations and notes by Ernest A. Moody and Marshall Clagett. Madison The University of Wisconsin Press 1952 438 p. illus. 24 cm. $5 00. 699

Contents General introduction, Part I, by M. Clagett—Part II, by E. A. Moody *Liber Euclidis de ponderoso et levi et comparatione corporum ad invicem*, edited by M. Clagett introduction, translation and notes by E. A. Moody. *Liber Archimenidis de insidentibus in humidum* (*Liber Archimenidis de ponderibus*) introduction by E. Moody and M. Clagett; text and translation by E. A. Moody, with additional variant readings by M. Clagett. *Liber de canonio*, edited, with introduction, translation and notes, by E. A. Moody *Liber karastonis*, edited, with introduction, translation and notes, by M. Clagett. *Elementa Jordani super demonstrationem ponderum*, edited, with introduction, translation and notes, by E. A. Moody *Liber Jordani de ponderibus*, with another commentary (version "P") edited, [illegible] introduction, translation and notes by E. A. Moody *Liber Jordani de ratione ponderis*, edited, with introduction, translation and notes by E. A. Moody; with the assistance of R. Clements, A. Ducat, and J. L. Saunders. *Tractatus Blasii de Parma de ponderibus*, edited, with introduction, translation and notes by M. Clagett. Appendices: A fragment of the Roman balance attributed to Euclid, edited by M. Clagett. Thomas Bradwardine's discussion of proposition one of the Liber de ponderibus, edited by E. A. Moody. A fourteenth century commentary on proposition one of the Liber de ponderibus, edited by E. A. Moody. A variant form of proposition eight of the Elementa Jordani, edited by M. Clagett. Variant readings. Sigla of manuscripts and editions. Critical notes. Bibliography. Index.

Note In this work the medieval treatises named in the table of contents have been collected and translated into English. The book is organized so that the Latin text is printed on the left-hand page and the English translation on the right-hand page. The significance of the texts is discussed in the general introduction and also in the introductions to the separate works. The book as [illegible] whole represents a real contribution to the history of classical physics.

WILSON CURTIS

William Heytesbury: medieval logic and the rise of mathematical physics. Madison University of Wisconsin Press 1956 219 p. 24 cm. $4.00 700

Contents: Introduction. *De incipit et desinit*. *De maximo et minimo*. *De tribus praedicamentis*. Conclusion. Appendix: List of abbreviations. The *Regulae* of William Heytesbury. The *Regulae* sets of Richard Kilvington. Notes. Bibliography: Heytesbury's works. Primary sources cited. Secondary works cited. Manuscripts cited. Index.

Note: One of [illegible] series of critical studies and texts in the history of science being published by the University of Wisconsin Press, this book is [illegible] study of the work and influence of William Heytesbury [illegible] Fellow of Merton College in the first half of the 14th century and later Chancellor of Oxford University. More specifically

It is a study of Heytesbury's *Regule solvendi sophismata*. The physical and mathematical content of this book are assessed from the viewpoint of the present, and its influence is traced in the works of authors who followed Heytesbury. The book is fully documented.

POPULAR WORKS

ASIMOV, ISAAC

Inside the atom. Illustrated by John Bradford. New York, Abelard-Schuman, Ltd., *1956. 176 p. illus. 21 cm. $2.75* *701*

Contents: Atomic contents. Atomic arrangements. Atomic twins. Atomic breakdowns. Atomic lifetimes. Atomic bullets. Atomic newcomers. Atomic energy. Atomic dangers. Atomic hope. Index.

Note. Although addressed to young people, this book is suitable for adult general readers. It explains the elements of atomic structure, the nature of atomic particles and atomic energy in simple terms. The style is eminently readable, and the illustrations, though few in number, add substantially to the exposition. The author is a graduate biochemist on the faculty of the Boston University School of Medicine.

DEAN, GORDON

Report on the atom; what you should know about the atomic energy program of the United States. New York, Alfred A. Knopf, 1953. 321 p. illus. 21 cm. 702

Note. Addressed primarily to the people of the United States of America, this book by a former chairman of the United States Atomic Energy Commission describes the methods and goals of this nation's atomic energy program. *It presents, further, the author's* views on the international aspects of atomic energy. Such matters as the mining and processing of uranium, the atomic bomb, radioisotopes, and the potentials of nuclear power are discussed authoritatively and in nontechnical terminology. A second edition containing an added chapter on national and international developments in 1953–56 was published in 1957. 359 p., $5.00.

EINSTEIN, ALBERT, AND LEOPOLD INFELD

The evolution of physics; the growth of *ideas from early concepts to relativity and* quanta. New York, Simon & Schuster, 1938. 319 p. illus. 21 cm. $3.95 703

Contents (abridged): The rise of the mechanical view. Vectors. The riddle of motion. Is heat a *substance?* The rate of exchange. The philosophical background. The kinetic theory of matter. The decline of the mechanical view. The two electric fluids. The magnetic fluids. The velocity of light. The riddle of color. The wave theory of light. Ether and the mechanical view. Field, relativity. The field as representation. The two pillars of the field theory. *Field and ether.* Ether and motion. Time, *distance, relativity.* The time-space continuum. General relativity. Quanta. Continuity, discontinuity. Elementary quanta of matter and electricity. The quanta of light. The waves of matter. Probability waves. Physics and reality. Index.

Note. The authors' intention in this volume is to sketch in broad outline the attempts of the human mind to find a connection between the world of ideas and the world of phenomena. The work is intended for the intelligent layman, and while there is *no attempt to present the theory of relativity so closely associated* with the senior author, there is nevertheless a brief outline of the major problems which the theory attempts to solve. The treatment, though nonmathematical, is not over-simplified, *and a fair ability to grasp difficult physical and philosophical* ideas is required of the reader.

GAMOW, GEORGE

Atomic energy in cosmic and human life, fifty years of radioactivity. New York, Cambridge *University Press, 1946. 161 p. illus. 21* cm. $3.00 *704*

Note. The purpose of this short book is to explain radioactivity and atomic energy *to the general reader. The atom bomb* occupies only a few pages, while the greater part of the book is devoted to a clearly written exposition of the properties and structure of atoms, atomic energy in the stars, and to a discussion of whether or not atomic energy will be used for peaceful purposes. The author has not hesitated to use graphs and mathematics where necessary, but both these and the rest of the writing are presented in a readily understandable manner.

HECHT, SELIG

Explaining the atom. Revised and with four additional chapters by Eugene Rabinowitch. New York, The Viking Press, 1954. 237 p. illus. 22 cm. $3.75 705

Contents: Prologue: Science, secrets, and the atomic bomb. The atom as a homogeneous ball. The atom becomes complex. The atom develops a structure. Atomic structure is completed. Atoms release *energy. Atomic bombs become possible. Atomic bombs can be made.* Atomic bombs are made. Atomic bombs become plentiful and varied. "Superbombs" are built. Attempts to outlaw atomic bombs fail. Atomic power emerges. Epilogue to the revised edition. Index.

Note. One of the most successful of the popular expositions of atomic structure and nuclear fission. It is clearly but not condescendingly written. About one-quarter of the book recounts the main events in the development of the atomic bomb. *The four chapters added in this edition outline developments after 1947,* such as the development of thermonuclear bombs and the failure of attempts to outlaw atomic bombs.

LAURENCE, WILLIAM LEONARD

Dawn over zero, the story of the atomic *bomb. Second edition, enlarged.* New York, Alfred A. Knopf, 1947. 289 p. illus. 22 cm. $4.50 706

Note. William L. Laurence was the only newspaper reporter present at the explosion of the first atomic bomb in a desert in New Mexico on July 16, 1945. Later at the Pacific bomb base on Tinian Island, he prepared the War Department's official press releases on the atomic bombing of Hiroshima and Nagasaki. This book contains accounts of what he saw and heard, and much more. The parts that contain the author's on-the-scene observations are unique and make exciting and awesome reading. The other parts of the book treat of more familiar aspects, including some of the same topics covered in the famous Smyth report and the usual speculations about future uses of atomic energy. The entire book, including the explanation of nuclear fission, is written in language that the layman can understand.

PIERCE, JOHN R.

Electrons, waves and messages. Drawings by Felix Cooper. Garden City, N. Y., Hanover House, *1956. 318 p. illus. 21 cm. $5.00* 707

Contents: Electronics and the world. The laws of motion. Electric fields and electrons. Magnetic fields, too. Waves. *Maxwell's* wonderful equations. Some vacuum-tube amplifiers. Signals, band width, traveling-wave tubes, and millimeter waves. Noise. Radiation. Microwave systems. *Picking up television.* About signals and noise. Communication theory. The unexpected. *Relativity* and quantum mechanics. The future. Appendix. Index.

Note. A well-written survey of modern electronics. The field has been interpreted broadly so as to include not only the phenomena of electron behavior but also the elements of information theory. The book is addressed to lay readers with some background in science, particularly physics, and to scientists reading outside their own specialties. The author has not avoided technical terms or mathematical computations, but he has surrounded them with so much readable text *that the book is not only informative but is* also a pleasure to read. In addition to affording an authoritative view of the principles of electronics and the importance of their applications in our modern world, it also illustrates some of the techniques *of present-day industrial research.* The author is Director of Electronics Research for the Bell Telephone Laboratories, Inc.

SACKS, JACOB

The atom at work. Revised printing. New *York.* The Ronald Press Company, 1956. 341 p. illus. 24 cm. $5.00 708

Contents: On the nature of matter. Natural radioactivity; the story of radium. Matter, energy and Einstein. Exploding the atom. Artificial radioactivity. Machines for modern alchemy. The neutron and the chain-reacting pile. How to trace the tracers. Isotopes in the chemical laboratory. Isotopes in the biology laboratory. Radioactive phosphorus, the ideal isotope. What radiation does to living beings. Radioactive isotopes in hospital and clinic. Isotopes in the world of plants. Isotopes go into business. Atomic warfare, past and future. Useful power as the ultimate goal. Index.

Note: A satisfactory popular account of progress in the understanding and application of atomic energy and artificial radioactivity. In the first three or four chapters the historical and scientific backgrounds are skillfully outlined, and the reader is provided with thumb-nail sketches of the contributions of Roentgen, Madame Curie, Bohr, Rutherford and many others. He is then introduced to atomic piles, radioactive isotopes, the atomic bomb and other potential radioactive weapons, and finally to atomic power.

MATHEMATICAL PHYSICS

BERGMAN, STEFAN AND M. SCHIFFER

Kernel functions and elliptic differential equations in mathematical physics. New York: Academic Press Inc., 1953. 432 p. 24 cm. (Pure and applied mathematics: a series of monographs and textbooks, edited by Paul A. Smith and Samuel Eilenberg) $8.00. 709

Contents: Part A. Boundary value problems for partial differential equations of elliptic type. Theory of heat conduction. Fluid dynamics. Electro- and magnetostatics. Elasticity. Part B. Kernel function methods in the theory of boundary value problems. Properties of solutions. The kernel functions and their properties. Variational and comparison theory. Existence theory. Dependence of kernels on boundary conditions and the differential equation. Conclusions. Author index. Subject index.

Note: An important contribution to the theory of boundary value problems in differential equations. In the first part, the authors present a variety of problems in physics, the analysis of which involves boundary-value problems. In the second part, they demonstrate the solution of boundary-value problems by kernel methods. The work is of interest to professional mathematicians, both theoretical and applied, and, of course, to mathematical physicists.

COURANT, R. AND D. HILBERT

Methods of mathematical physics. First English edition translated and revised from the German original. Volume 1. New York: Interscience Publishers, Inc., 1953. 561 p. illus. 23 cm. $9.50. 710

Contents: The algebra of linear transformations and quadratic forms. Series expansions of arbitrary functions. Linear integral equations. The calculus of variations. Vibration and eigenvalue problems. Application of the calculus of variations to eigenvalue problems. Special functions defined by eigenvalue problems. Additional bibliography. Index.

Note: First published in Berlin in the German language in the years between the two world wars, this work quickly gained an international reputation. The volume listed above is the first one published of an English translation being made under the author's direction. It is based on the German original but contains many revisions and additions made by the author. The "Additional bibliography" is presently a list of recent books in German and English pertinent to the subjects of the chapters of this volume. References to older literature, mostly articles and monographs in German, are included in the chapters. The second volume of the projected three-volume set is scheduled for publication in 1956.

FRIEDRICHS, K. O.

Mathematical aspects of quantum theory of fields. New York: Interscience Publishers, Inc., 1953. 272 p. illus. 26 cm. $6.00. 711

Contents (abridged): Field operators. Particle representation. Boson field in interaction with a given source distribution. Occupation number representation and fields of different kinds. Fields modified by linear homogeneous forms. Appendix: Lorentz invariant treatment of Boson fields. Comments and corrections. Supplementary bibliography.

Note: The author of this volume has stated: "Our primary object is to present basic sections of field quantum theory in a consistent mathematical language without carrying out all mathematical deductions with complete rigor." Although the treatment is not completely rigorous, the book is intended for mathematicians rather than physicists. The five parts were originally published as separate papers in *Communications on pure and applied mathematics*. Apparently they have been reprinted without change. However, the final section of comments and corrections, which contains changes and coordinates the notation, is new.

HOUSTON, WILLIAM VERMILLION

Principles of mathematical physics. Second edition. New York: McGraw-Hill Book Company, Inc., 1948. 363 p. illus. 23 cm. (International series in pure and applied physics, G. P. Harnwell, consulting editor) $7.00. 712

Contents: Elementary differential equations. The mechanics of particles. Linear equations of order higher than the first. Mechanics of vibrating particles. Calculus of variations. Hamilton's principle. Theory of vibrating systems. Vector analysis. Dynamics of rigid bodies. Thermodynamics. Statistical mechanics. The vector field. Electrostatics. Magnetostatics and the interaction of steady currents. The electromagnetic field. The restricted theory of relativity. Index.

Note: An introductory text designed for the use of college students who have studied elementary college physics and mathematics through calculus. The fundamental laws and theories of classical physics are of necessity introduced, but the emphasis is on the mathematical processes. Problems for the student to work form an integral part of the text. In this edition the chapters on electricity and magnetism have been expanded, and such topics as damped vibrations, forced vibrations, the pendulum, and non-homogeneous equations are treated at greater length. There are other changes, including the addition of a considerable number of diagrams.

LINDSAY, ROBERT BRUCE

An introduction to physical statistics. New York: John Wiley & Sons, Inc., 1941. 306 p. illus. 23 cm. $5.75. 713

Contents: Dynamical and statistical theories. Elementary probability and statistics. Review of thermodynamics. Classical Maxwell-Boltzmann statistics. The kinetic theory of gases. Classical statistical mechanics. Statistical mechanics by the method of Darwin and Fowler. Fundamentals of quantum statistics. Specific heats of gases and solids. Quantum statistical theory of electrical and thermal properties of metals. Emission of electrons from surfaces. Index.

Note: A brief survey of and introduction to the fundamental methods of statistical technique in use in physics, with careful analysis of how they are used. It is meant for use in courses in physical statistics and statistical mechanics for graduate students of the first or second year and may also be used by advanced undergraduate students who have sufficient background knowledge. The reader must have a knowledge of theoretical physics and advanced calculus if he is to follow the argument. Although the emphasis is on the methodological viewpoint, illustrations are provided for every topic introduced, and there are many practical applications to modern physics, particularly to the properties of gases and solids. A list of problems is given at the end of each chapter.

MENZEL, DONALD H., editor

Fundamental formulas of physics. New York: Prentice-Hall, Inc., 1955. 765 p. illus. 22 cm. $12.00. 714

Contents: Basic mathematical formulas, by P. Franklin. Statistics, by J. M. Cameron. Nomograms, by D. H. Menzel. Physical constants, by J. W. DuMond and E. R. Cohen. Classical mechanics, by H. Zatzkis. Special theory of relativity, by H. Zatzkis. The general theory of relativity, by H. Zatzkis. Hydrodynamics and aerodynamics, by M. M. Munk. Boundary value problems in mathematical physics, by H. Zatzkis. Heat and thermodynamics, by P. W. Bridgman. Statistical mechanics, by D. H. Menzel. Kinetic theory of gases—viscosity, thermal conduction, and diffusion, by S. Chapman. Electromagnetic theory, by N. H. Frank and W. Tobo-

man. Electronics, by E. L. Chaffee. Sound and acoustics, by P M. Morse. Geometrical optics, by J G Baker Physical optics, by F A. Jenkins. Electron optics, by E. G. Ramberg. Atomic spectra, by C. E. Moore. Molecular spectra, by L. Herzberg and G. Herzberg. Quantum mechanics, by L. I. Schiff. Nuclear theory by M. E. Rose. *Cosmic rays and high-energy phenomena*, by R. W Williams. Particle accelerators, by L. L. Foldy Solid state, by C. Herring The theory of magnetism, by J H. Van Vleck. Physical chemistry by R. E. Powell. Basic formulas of astrophysics, by L. H. Aller *Celestial mechanics*, by E. W Woolard. *Meteorology* by R. A. Craig. Biophysics, by J M. Reiner Index.

Note The wide scope of this book is roughly indicated by the chapter titles. Generally speaking, the elementary formulas such as are found in undergraduate texts and laboratory handbooks have been omitted. Also, the word "formula" has been given liberal interpretation for instance, under the subheading "Solutions of the Schrödinger equation for collision problems," in the chapter on quantum mechanics, there are two pages on compact exposition Formulas and equations are not "derived" in the mathematical sense, but most of them are explained. References to sources where, in most instances, more analysis and discussion are available are given. The book is designed as a *reference* tool for advanced *students of physics and graduate physicists*, it should soon become a standard fixture in every physics library

MORSE, PHILIP M , AND HERMAN FESHBACH

Methods of theoretical physics New York McGraw Hill Book Company, Inc., 1953 2 v illus 24 cm. (International series in pure and applied physics, Leonard I. Schiff, consulting editor) $15 00 per vol 715

Content Part I Types of fields. Equations governing fields. Fields and the variational principle. Functions of complex variable. Ordinary differential equations. Boundary conditions and eigenfunctions. Green's functions. Integral equations. Part II Approximate methods. Solutions of Laplace's and Poisson's equations. The wave equation. Diffusion, wave mechanics. Vector fields. *Appendix. Tables. Bibliography Index.*

Note A graduate-level treatise on a variety of mathematical techniques which are useful in analyzing and solving problems concerned with fields of theoretical physics. It is primarily concerned with methods for solving partial differential equations for various boundary conditions. As to its title, the authors have stated "Fifty years ago it might have been entitled 'Partial differential equations of physics' or 'Boundary value problems.' Today because of the spread of the field concept and technique, it is perhaps not inappropriate to use the more general title." Although developed in courses given by the authors at Massachusetts Institute of Technology and designed for the instruction of graduate students of physics, the work is so comprehensive and the methods *covered expounded so thoroughly that it is useful as a reference* by graduate physicists and applied mathematicians. Problems to be solved are included in most chapters, and selected literature references are given.

PAGE, LEIGH

Introduction to theoretical physics Third edition. Princeton D Van Nostrand Company Inc. 1952 701 p illus 23 cm $9 00 716

Contents Introduction Vector analysis. Part I, Dynamics Dynamics of particles. Dynamics of rigid bodies. Dynamics of deformable bodies. Advanced dynamics Part II, Hydrodynamics Hydrodynamics of perfect fluids—of viscous fluids. Part III, Thermodynamics Classical thermodynamics. Statistical mechanics. Kinetic theory of gases. Part IV Electromagnetism Electrostatics and magnetostatics. Electric currents. Electromagnetic theory Part Optics and spectroscopy Geometrical optics. Physical optics. Origin of spectra *Index.*

Note. A standard and relatively elementary introduction to classical theoretical physics. The mathematics has been kept as simple as possible by an extensive use of vector methods. The book is well organized and clearly written. It is designed for the instruction of advanced undergraduates and first-year graduate college students who are specializing in physics. The second edition was published in 1935 Although most of its text has been carried over to this third edition, important additions have been made in both the expository text and problems *and the length of the* volume has been increased by 40 pages.

PÓLYA, GYORGY, AND GABOR SZEGŐ

Isoperimetric inequalities in mathematical physics. Princeton Princeton University Press, 1951 279 p 25 cm (Annals of mathematics studies, Emil Artin and Marston *Morse, editors No 27)* $3 00 717

Content Definitions, methods and results. The principles of Dirichlet and Thomson. Applications of the principles of Dirichlet and Thomson to estimation of capacity Circular plate condenser Torsional rigidity and principal frequency *Nearly* circular and nearly spherical domains. On symmetrization. On ellipsoid and lens. Surface-area and Dirichlet's integral. On continuous symmetrization. On spherical symmetrization. On a generalization of Dirichlet' integral. *Heat*-conduction on a surface. On membranes and plates. Virtual mass and polarization. Tables for some set-functions of plane domains. Bibliography List of symbols.

Note The purpose of this book is to facilitate the estimation of physical quantities *on the basis of geometrical data, or the obtaining* of less accessible quantities in terms of more accessible ones. The authors show that whereas the area enclosed by a curve cannot be determined merely by knowing its perimeter the knowledge of the perimeter sets certain limits for the area. Other quantities such as the moment of inertia, with respect to the centroid, of homogeneous plate bounded by the curve, the torsional rigidity of an elastic beam the cross-section of which is bounded by the given curve, the principal frequency f a clamped plate of the same size *and shape, and the electrostatic* capacity can be determined from the size and shape of a curve. *The study is* product of project sponsored by the Office of Naval Research. An especially useful section is the tabular presentation of quantities in the final chapter

RAINICH, GEORGE YURI

Mathematics of relativity New York John Wiley & Sons Inc. 1950 173 p illus. 23 cm $4 75 718

Contents (abridged) I, Old physics Motion of a particle. The inverse square law Two pictures of matter Maxwell's equations. General equations of motion. The complet tensor II, New geometry Analytic geometry of four dimensions. Tensor analysis. Complications resulting from imaginary coordinate. *Are the equations of physics invariant?* Curves in the new geometry III, Special relativity Equations of motion. Addition of velocities. Light corpuscles or photons. The complete tensor. IV Curved space Generalizations. The Riemann tensor. Tensors in general coordinates. Riemann tensor in general coordinates. Equations f physics in general coordinates. V General relativity The law of geodesics. Solution of the field equations. Newtonian motion of planet. Relativity motion of planet. Deflection of light. Conclusion. Index.

Note An introductory exposition f the mathematical concepts and techniques necessary to a full comprehension of relativity The book is designed for upperclass and graduate college students majoring in mathematics or physics The author is Professor of Mathematics in the University of Michigan and the book is development of course hich he has taught there for more than twenty years.

WEBSTER, ARTHUR GORDON

Partial differential equations of mathematical physics Edited by Samuel J Plimpton. Second corrected edition New York Dover Publications, Inc. 1955 440 p illus. 21 cm. $1 98 719

Contents. Deduction of the differential equations. Equations of the first order Wave equation—vibrations and normal functions. *Fourier's series and integral—Cauchy's* method—initial data. Methods of Green—potentials—boundary problems. Method of Riemann-Volterra—characteristics. Spherical, cylindrical and ellipsoidal harmonics. Applications of spherical, cylindrical and ellipsoidal harmonics. Theory f integral equations. Appendix.

Note A major work written just before his death by one of the most eminent mathematical physicists of the United States of America. It was first published in 1927 and a slightly revised second edition was published in 1933 The edition listed here is reprint of the second edition without *changes in the text.*

TABLES

FORSYTHE, WILLIAM ELMER, compiler

Smithsonian physical tables. Ninth revised edition. Washington, D. C. The Smithsonian Institution 1956. 827 p. 24 cm. (Smithsonian miscellaneous collections. Vol. 120 (whole volume) Publication 4169) $10.00. 720

Contents (abridged): Some fundamental definitions. Fundamental standards. The new (1948) system of electrical units. Relative values of the three systems of electrical units. Treatment of experimental data. General physical constants. Thermometry. Emissivities of [illegible] of materials. Heat flow and thermal conductivity. Specific heat. Latent heat. Heats of combustion. Physical and mechanical properties of materials. Characteristics of plastics. Properties of [illegible] woods. Temperature, pressure, volume, and weight relations of gases and vapors. Compressibility. Densities. Acoustics. Viscosity of fluids and solids. Various electrical characteristics of materials. Some characteristics of dielectrics. Radio propagation data. Magnetic properties of materials. Geomagnetism. Reflection and absorption of radiation. Standard wavelengths and series relations in atomic spectra. Atmospheric electricity. Colloids. Kinetic theory of gases. Atomic and molecular dimensions. Radioactivity. Gravitation. Solar radiation. General conversion factors. Index.

Note: A standard reference work for the physicist, meteorologist, and astronomer as well as for the research engineer in any of the allied branches of physics. Most of the tables are accompanied by short descriptive paragraphs and additional references. Physical units and standards are defined in the introduction. The ninth revised edition has been enlarged by 30 tables and almost 200 pages, this because due primarily to the inclusion of new data on atomic physics. Many of the tables found in the earlier edition have been regrouped, and a more detailed index is provided.

KEENAN, JOSEPH HENRY, AND JOSEPH KAYE

Gas tables: thermodynamic properties of air, products of combustion and component gases, compressible flow functions including those of Ascher H. Shapiro and Gilbert M. Edelman. New York: John Wiley & Sons, Inc., 1948. 238 p. illus. 26 cm. $6.00 721

Contents (abridged): Tables. Sources and methods. Examples. Bibliography.

Note: This collection of 64 tables is intended primarily for engineers concerned with making calculations of gas-turbine processes. It supersedes an earlier work entitled *Thermodynamic properties of air*, New York, 1945. The tabulated properties of air found in the 1945 volume, have been expanded to cover air at lower temperatures, and a base temperature, for which enthalpy is zero on the absolute Fahrenheit scale, has now been used in making the calculations. The volume has been further enlarged to include the properties of products of combustion of hydrocarbons and tables of functions used in analyzing the flow of compressible fluids.

MARYOTT, ARTHUR A., AND FLOYD BUCKLEY

Table of dielectric constants and electric dipole moments of substances in the gaseous state. Washington, D. C. Government Printing Office, 1953. 29 p. illus. 26 cm. (United States. National Bureau of Standards. Circular 537) $0.20 722

Contents: Introduction. Reference units. Treatment of data. Table of dielectric constants of substances gases at 20°C and 1 atmosphere. Dipole moments. Treatment of data. Reliability of values of dipole moment. Explanation of table of dipole moments. Table of dipole moments: Inorganic gases. Organic substances. Bibliography.

Note: Values of the dipole moments and other pertinent information, are tabulated for approximately 310 substances in the vapor state. All values derived from measurements of dielectric constants have been recalculated by one of two systematic procedures in order to place the work of various investigators on a more comparable basis than exists in the literature. Values obtained independently from microwave spectroscopy and other methods are also included. Values of the dielectric constants recommended for reference purposes are listed for helium, hydrogen, oxygen, argon, air, nitrogen and carbon dioxide. These selected values were derived from a consideration of radio frequency, microwave, and optical data. The two tables were prepared in continuation of a program for the critical examination of the data of physics and chemistry sponsored by the National Bureau of Standards in cooperation with the Committee on Tables of Constants and Numerical Data of the National Research Council and the Commission on Tables of Constants of the International Union of Chemistry. The first table of the series, entitled "Table of dielectric constants of pure liquids," is published as Circular 514 of the National Bureau of Standards.

MARYOTT, ARTHUR A., AND EDGAR R. SMITH

Table of dielectric constants of pure liquids. Washington, D. C. Government Printing Office 1951. 44 p. 26 cm. (United States. National Bureau of Standards. Circular 514) $0.30 723

Contents: Introduction. Description of table. Table of dielectric constants: Standard liquids. Inorganic liquids. Organic liquids. Bibliography.

Note: This circular contains the "static" dielectric constants of more than 800 substances in the liquid state, the tables being divided into three sections: standard liquids, inorganic liquids, and organic liquids. Reference sources are given for the liquids in the inorganic and organic groups, and probable accuracy of the data is indicated. The tables are reproduced from typewritten copy. The work is part of a program for a critical examination of the data of physics and chemistry sponsored by the National Bureau of Standards in cooperation with the Committee on Tables of Constants and Numerical Data of the National Research Council and the Commission on Tables of Constants of the International Union of Chemistry.

WESSON, L. G.

Tables of electric dipole moments, compiled by L. G. Wesson. Cambridge, Mass. The Technology Press 1949. 90 p. 24 cm. $2.50. 724

Note: A tabulation of more than 1,500 compounds, from molecules as unsymmetrical and for which the dipole moment has been calculated. The inorganic compounds are listed alphabetically, the organic by formula, and each entry includes the solvent used, the temperature at which the substance was measured, the dipole moment value, and the literature reference. The values, which are important in determining the dielectric properties of gases, liquids, and solids, were compiled by the Laboratory for Insulation Research at Massachusetts Institute of Technology.

GENERAL TEXTBOOKS

ALBRIGHT, JOHN GROVER

College physics. New York: Ronald Press Company 1948. 735 p. illus. 23 cm. $5.00 725

Contents: Part I, Mechanics. Physical quantities and measurement. Motion—Velocity. Uniformly accelerated motion. Angular motion (rotational motion). Force and Newton's laws of motion. Gravitational forces. Torques and rotary motion. Equilibrium of static forces. Circular motion. Oscillatory motion. Work and energy. Power—Machines. Matter and properties of matter. General properties of matter. Hydrostatics. Surface tension. Fluids in motion. Mechanics of gases. Pneumatic appliances. Part II, Heat. Temperature and its measurement. Thermal expansion. Calorimetry. Change of state. Transfer of heat. Thermodynamics. Part III, Wave motion and sound. Wave motion. Production and transmission of sound. Sound reception. Physical basis of music. Part IV, Magnetism and electricity: Magnetism. Electrostatics. Electrodynamics. Electrochemical action. Heating effects of an electric current and thermoelectricity. Electromagnetism. Action between currents and magnets. Electromagnetic induction. Electric generators and motors. Alternat-

ing currents. Conduction of electricity through gases. Part v Light Nature and propagation of light. Reflection—Mirrors. Refraction—Prisms—Lenses. Photometry Spectroscopy and color Optical instruments. Interference—Diffraction—Polarization. Appendix. Answers to problems. Index.

Note A prominent feature of this introductory textbook is the clear and comparatively full treatment of fundamental principles and phenomena. The chapter on surface tension, for example, contains about 30 per cent more text than the average amount devoted to the subject in four other standard textbooks. The same chapter contains 12 illustrations. Somewhat more space is given to mechanics and somewhat less to electricity and magnetism than is usual in such books. Practical applications of fundamental principles are mentioned in passing, but the treatment does not lean on them. The book is eminently suitable for library use, in addition to its use in organized courses.

AVERY, MADALYN

Household physics, a textbook for college students in home economics Third edition. New York The Macmillan Company 1955 472 p illus 22 cm. $6.25 726

Contents (abridged) Mechanics Introduction to mechanics. Work, energy and power Simple machines. Density and specific gravity Mechanics of liquids and gases. Household water supply and sewage disposal. Heat Thermometers. Quantity of heat. Change of state. Fuels. Heat transfer. Refrigeration. Air conditioning the home. The weather Electricity Sources and uses of electricity Magnetism. Electrostatics. Simple electromagnetic generators. Electrical measurements. Electric heating devices. Electric motors. Chemical effects of a current. House wiring. Light. Reflection of light. Prisms, lenses, and gratings. Color Home illumination. The production and transmission of sound. Musical sounds and musical instruments. Electrical sound devices. Appendix. Index.

Note The special bias of this book is indicated by the subtitle. Essentially it is a simple introduction to classical physics in which basic principles and concepts are related to household equipment and practices. The exposition of the principle of the lever, for example, is supplemented by illustrations and descriptions of scissors, tongs, etc. The discussion of electrical principles is followed by whole chapters on electrical devices used in homes. The first edition was published in 1938 and the second edition in 1946. The level of treatment and the basic topics covered are essentially the same in this third edition. However new applications are described, such as hearing aids based on transistors.

BACHMAN, C H

Physics, a descriptive interpretation New York John Wiley & Sons, Inc., 1955 497 p illus. 23 cm $5.50 727

Contents (abridged) Introduction—some fundamental working knowledge. Microcosmic physics. Macrocosmic physics. Cosmic physics. Body applications of physical principles. Some practical applications of physics—engineering. The acceleration of scientific progress. Index.

Note As the subtitle implies, this book is an elementary and nonmathematical survey It is addressed primarily to college students who are preparing for fields which will not require a scientist's knowledge of physics, and it appeals also to some lay readers. The concepts of radiation and the electromagnetic spectrum are introduced very early thus, the account is made interesting from the beginning. Unlike some of the descriptive books on physics, little space is given to descriptions of applications. Only a few devices which are found in the average American home such as electric lights, telephones, television, heating system, and refrigerators are described.

BALLARD, STANLEY S , AND OTHERS

Physics principles By Stanley S Ballard Edgar P Slack, and Erich Hausmann Princeton D Van Nostrand Company Inc. 1954 743 p illus. (part col d) 23 cm $7 75 728

Contents (abridged) Mechanics. Heat. Electricity & magnetism. Wave motion & sound. Optics. Modern physics Quantum optics. Nuclear physics. Appendixes. Answers to odd-numbered problems. Index.

Note A textbook intended for use in introductory courses offered to students who are preparing for further study of physical science of careers in engineering. The level of exposition is more advanced than in introductory textbooks of the "cultural" type, and the book's scope is more comprehensive. Calculus is used in the exposition and problems, but is introductory in such a way that the book can be studied by students who are taking courses in calculus concurrently Although some paragraphs and sections are essentially identical with their counterparts in E. Hausmann and E. P Slack, *Physics*, described below, the discussions of most topics differ between the two books and are somewhat more advanced in *Physics principles*. The subject scope of the latter is somewhat broader and the problems included for students to solve are different.

BAYLEY, PAUL LEVERN, AND CHARLES CLARENCE BIDWELL

An advanced course in general college physics. New York The Macmillan Company, 1936 340 p illus. 22 cm. $6 00 729

Contents (abridged) Mechanics Fundamental concepts of position and motion. Equilibrium. Work and energy Elasticity Sliding friction. Impact. Wave motion and sound. Heat: Thermometry Expansion of gases. Heat as energy Properties of gases. Thermodynamics. The transfer of heat. Electricity and magnetism Electrostatics. Magnetism. Electrical measuring instruments. The ballistic galvanometer Light. The nature of light. Luminous intensity Illumination and brightness. Diffraction. Electron physics and the quantum theory: Electrons and their properties. The quantum theory Index.

Note This book has been designed for the second-year course in general college physics. A knowledge of calculus is essential, but the arrangement and treatment are such that calculus need not precede, but may be taken concurrently The problems have been selected to give practice in both the metric and English units.

BENNETT, CLARENCE E

First year college physics New York The Ronald Press Company 1954 526 p. illus. 23 cm $6 00 730

Contents (abridged) Introduction. Fundamental concepts—standards. Mechanics—study of forces and vectors. Kinematics of translation. Linear dynamics. Work and energy Kinematics of rotation. Dynamics of rotation. Elasticity Fluid phenomena. Wave motion. Heat transfer and thermodynamics. Electrostatics. Electric circuits. Magnetism. Alternating currents. Electronics. Nuclear physics. Nature of light photometry Regular reflection and refraction. The thin lens in air Optical instruments. Interference, diffraction, and polarized light. Index.

Note The author of this book is head of the Department of Physics of the University of Maine, and the book is designed for use in full-length college courses. It is largely devoted to the traditional contents of introductory courses in classical physics. Elementary algebra and trigonometry are the only mathematics used in the exposition. Due attention is given to careful definitions of terms and elucidation of basic concepts, and the descriptive material is limited to descriptions of instruments based on physical principles.

BERGMANN, PETER GABRIEL

Basic theories of physics mechanics and electrodynamics. New York Prentice-Hall Inc., 1949 280 p. illus. 22 cm (Prentice-Hall physics series Donald H Menzel editor) $6 00 731

Contents Part I Classical mechanics: Mechanics of mass points. Analytical mechanics. Matter in bulk. Summary of classical mechanics. Part II, Electrodynamics Electrostatics and magnetostatics. Electromagnetic interaction. The electromagnetic field. Waves. Relativity Optics. Conclusion. Further reading. Index.

Note A brief textbook presenting the theoretical foundations of classical physics, that is, Newton's mechanics and Maxwell's electrodynamics, and tracing the development of classical physics through to the special theory of relativity Attention is concentrated on physical ideas, and the mathematical techniques are considered as tools and discussed as needed. The work is intended for graduate students in theoretical physics.

BITTER, FRANCIS

Currents, fields, and particles. New York Published jointly by The Technology Press of Massachusetts Institute of Technology and John Wiley & Sons Inc., 1956 599 p. illus. 24 cm. $8.50 732

Contents: The basic electrical quantities and their measurement. Electric fields. The electrical properties of matter. Applied electricity. Magnetic fields. Induced electromotive force and inductance. Electromagnetic oscillations. The Poynting vector and electromagnetic waves. Optics: reflection and refraction—interference and diffraction. The experimental basis of atomic physics. Wave mechanics. Atoms and electrons. Atomic nuclei and nuclear radiations. Index.

Note: A new physics textbook in which the treatment is more quantitative, and there is more emphasis on abstract concepts, than are traditional in undergraduate texts. The chapter titles are listed above. Within the chapters occur such sub-topics as "Metals and semi-conductors," "Fields inside of polarized bodies," "Maxwell's equations," "Magnetic resonance phenomena," "The quantization of electromagnetic energy," and "The angular momentum of the hydrogen atom." Such topics are treated more briefly than they would be in a graduate-level text, but the reader is introduced to them. The book was planned as a text for second courses in physics offered to students majoring in science and engineering. The author is Professor of Physics on the faculty of the Massachusetts Institute of Technology.

BLACK, NEWTON HENRY AND ELBERT PAYSON LITTLE

An introductory course in college physics. Fourth edition. New York The Macmillan Company 1956 786 p. illus. 22 cm. $6.75 733

Contents (abridged): Mechanics: Simple machines, elementary torque. Power and efficiency. Pressure in liquids. Pressure of gases. Concurrent and nonparallel forces. Uniformly accelerated motion. Newton's laws and universal gravitation. Energy and momentum. Rotary motion. Simple vibratory motion. Heat: Temperature and expansion. Change of state. Physics of the atmosphere. Transmission of heat. Steam engines. Internal combustion engines. Magnetism and electricity: Electrostatics. Electric circuits. Electric power, heating, and lighting. Induction coils and transformers. Alternating currents. Electric waves. Vacuum tubes and transistors. Sound: Sound waves. Musical sounds. Optics: Lenses and illumination. Refraction of light. Lenses. Spectra and color. Polarized light. Structure of the atom. Appendix. Index.

Note: A long-established textbook for use in introductory college courses. The first edition was published in 1933 and the third edition in 1946. The level is more elementary than in most American physics textbooks also intended for the use of beginning students. The exposition of physical principles is supplemented by descriptions of applications, but these are not a predominant feature. The traditional topics of classical physics are covered, and atomic physics is given relatively little space. This fourth edition is the first to bear the name of a collaborator. In comparison to the preceding edition, there has been some reorganization of the material, the old problems have been deleted and new ones substituted, and paragraphs or sections have been added on a selected number of new topics and developments, such as nuclear fission and the transistor.

BLACKWOOD, OSWALD AND WILLIAM KELLY

General physics. Second edition. New York John Wiley & Sons Inc., 1955 704 p. illus. 23 cm. $6.75 734

Contents (abridged): Mechanics: Science and measurement. Pressure in liquids at rest. Resultants and components of forces. Work, power and machines. Rectilinear motion. Curvilinear motion. Energy and momentum. Fluids in motion. Rotary motion. Gravitation. Molecular physics and heat: Molecular forces. Molecular motion. Quantity of heat. Change of phase. Heat, work, and entropy. The physics of the weather. Vibrations, wave motion, and sound. Electricity and magnetism: Electric fields and potential difference. Electric circuits. Electrolysis and voltaic cells. Electrical power and heating effects. Magnetism. Generators and motors. Electronics. Light: Reflection and refraction. Lenses and curved mirrors. Optical instruments. Polarized light. The new physics: Gaseous conduction, X-rays, and isotopes. Photoelectricity, the Bohr atom, and matter waves. Radioactivity, nuclear energy, and cosmic rays. Appendices. Index.

Note: A textbook written for use in introductory courses in colleges. Wherever possible, the exposition of principles is related to a specific illustration or application, within the experience of average college students. Mathematics is introduced very gradually and calculus is not employed. Most of the space is devoted to the traditional topics of classical physics, but, as shown in the above contents, there are three terminal chapters on modern physics. The first edition was published in 1941. In this second edition, the level of treatment has been raised somewhat, but the book is still a relatively simple text. Many sections of the text have been revised, and the majority of illustrations are revised or newly added.

BLÜH, OTTO

Principles and applications of physics. By Otto Blüh in collaboration with Joseph Denison Elder New York Interscience Publishers Inc., 1955 866 p illus. 25 cm $7.00 735

Contents (abridged): The methods of physics. The basic concepts of physics (mechanics). Forms of energy. Fields of force. Oscillations and waves. Thermodynamics. The constitution of matter. Corpuscles and quanta. The constitution of the atom. Scope and importance of the physical sciences. Historical table. Index.

Note: A college textbook with certain uncommon qualities. It is introductory to the study of physics, but it contains more matter and carries the subject farther than is customary in texts for first courses. Furthermore, it seeks to give a rounded picture of present-day physics, including its significance and relation to the humanities. In most sections the exposition is written out rather fully as if the authors intended the reader to assimilate much of it without assistance from an instructor. Although not primarily a descriptive treatment, some of the chapters do contain extensive passages on applications. The first-named author is a member of the faculty of the University of British Columbia, and the second-named is Science Editor of the Harvard University Press.

BROWN, THOMAS BENJAMIN

Foundations of modern physics. Second edition. New York John Wiley & Sons Inc., 1949 391 p. illus. 24 cm. $6.50 736

Contents: The elementary electric charge and the electron. Dimensions of atoms. The wave character of light. Polarized light. Electrical oscillations and electromagnetic waves. The electromagnetic spectrum—infrared light, ultraviolet light, and X-rays. Light particles and electron waves. The hydrogen spectrum and the hydrogen atom. Optical spectra and atomic structure. X-ray spectra and many-electron atoms. Molecular motions. Molecular energy. Crystals. Black body radiation. Radioactivity. Nuclear [illegible]. Nuclear research. Nuclear energy. Cosmic rays. Epilogue. Appendices. Index.

Note: A textbook for college use in which the discoveries and theories of the past century that form the basis for present-day developments in physics are discussed. Emphasis is placed on experimental methods, and only elementary mathematics is employed. This edition has been revised in the light of recent developments in the field, and the chapter on nuclear theory has been expanded to form three new chapters covering nuclear energy and its applications. Review problems and suggested readings are again included at the end of each chapter.

BURTON, ELI FRANKLIN AND OTHERS

College physics by E. F. Burton, H. Grayson-Smith and F. M. Quinlan. New York Pitman Publishing Corporation, 1948. 724 p. illus. 24 cm. $4.50 737

Contents: Part I, Mechanics. Part II, Properties of matter. Part III, Wave motion. Part IV, Heat. Part V, Electricity and magnetism. Part VI, Sound. Part VII, Light. Index.

Note: In this well-written text, the material has been selected for the benefit of preprofessional students rather than for students who plan to specialize in physics. The section on electricity and magnetism is fuller than it is in most books, and in it the emphasis is on electrical measurements and measuring instruments, alternating-current motors, and radio reception and transmission. The discussion of sound and sound waves contains many interesting experiments to illustrate refraction phenomena and quality of sounds. The book ends with the quantum theory and with a [illegible] growing out of the experiment which indicates that cathode rays are particles.

Cable, Emmett James, and others

The physical sciences. By Emmett James Cable, Robert Ward Getchell, William Henry Kadesch, with chapters on astronomy by Harry E Crull. Third edition. New York Prentice Hall, Inc., 1951 496 p illus (part col d) 25 cm $6 00 738

Contents (abridged) The dawn of science. Weights and measures. Energy utilized. Energy wasted. Force and motion. Fluids and fluid pressure. Building stones of matter States of existence. The behavior of molecules. Heat as a form of energy Our atmosphere. Winds and weather Optical instruments. Spectra. Electrostatics and magnetism. Electric currents. Electrical communication. X-rays. Radioactivity Some fundamental chemical processes. Ionization and equilibrium. Nitrogen and its compounds. The halogens. The classification of the elements. Sulfur Some common metals. Organic and food chemistry The earth and its rocks. Ground water and its work. Diastrophism, an ever-working process. Earthquakes and volcanism. The earth as an astronomical body The moon and eclipses. Other members of the solar system. The sun and its radiation. The stars and nebulae. The Milky Way and extragalactic systems. Science and the world of to-morrow Questions. References. Index.

Note. A survey of the physical sciences in language as non technical as the subject matter permits. The book indicates the essential unity of the physical sciences and the pronounced effect they have had upon modern life. In the third edition the book has been given larger and more attractive format, and the number of illustrations has been increased from 319 to 345. The section on astronomy has been completely rewritten and the list of questions and problems has undergone revision. The work was particularly written for use in freshman survey courses in science in teachers colleges. It may also be used to advantage by non-academic readers interested in an introductory view of the physical sciences.

Constant, F Woodbridge

Theoretical physics, mechanics of particles, rigid and elastic bodies, fluids, and heat flow Reading, Mass Addison Wesley Publishing Company, 1954 281 p illus. 24 cm $7 50 739

Contents: Part I, Vector analysis The algebra of vectors. The calculus of vectors. Dyadics. Part II, Mechanics Velocity and acceleration. Newton's laws. The linear motion f particle. Motion of particle in two or more dimensions. Motion of group f particles. Rigid bodies. Advanced dynamics. Elastic media. Elastic waves and sound. Viscous media. General principles f fluid dynamics. Part III, Heat flow References. Index.

Note. A college textbook designed for senior and first-year graduate students who have completed standard introductory courses in physics and mathematics. It is an "easy" introduction to theoretical physics rather than a full-scale treatise and is characterized by careful selection of material and patient exposition. The scope and basic ideas of theoretical physics are delineated, concepts and terms are carefully defined, and selected mathematical techniques are expounded in detail. Many of the problems illustrate applications to common problems in physics.

Durbin, Frank M

Introduction to physics. New York Prentice Hall, Inc., 1955 780 p illus. 23 cm. $6 75 740

Contents (abridged) Measurement and problem solving. Scalar and vector quantities. Work and energy Machines. Mechanics of liquids and gases. Uniformly accelerated motion. Rotary motion. Periodic motion. Gravitation. Heat and temperature. Change f state. Heat transfer and radiation. Vibrations and waves. Audible sound. Electricity—some fundamental principles. Magnetic and chemical effects f currents. Generation, distribution and consumption of electrical energy The nature and measurement of light. Spectra. Interference and diffraction. Optical instruments. The physics of small particles. The electron. Electronic devices. The structure of the atom. Natural radioactivity Nuclear reactions. Appendix. Index.

Note. Although the topics in classical physics which are traditionally covered in introductory courses in colleges in the United States of America are all included in this book, the treatment of them has been shortened somewhat, so as to give m[illegible] necessary space to modern physics. The treatment begins with "The physics of small particles" and includes all the chapters whose titles are listed subsequently in the above table of contents. These topics are treated at an elementary level, but the student is afforded a fair view of the scope of modern physics and an explanation of some of its basic concepts. The book is offered for courses offered to students who are not preparing for engineering or the physical sciences. The author is Professor of Physics in Oklahoma Agricultural and Mechanical College.

Ference, Michael, Jr., and others

Analytical experimental physics. Third revised edition. By Michael Ference, Jr., Harvey B Lemon, and Reginald J Stephenson. Chicago University of Chicago Press, 1956. 623 p illus 26 cm $8 00 741

Contents Kinematics and statics of particle. Dynamics of particle—mass—force. Conservation of momentum. Work and energy Rigid bodies in equilibrium [illegible] Elasticity Simple harmonic [illegible] Surface tension. Temperature and its [illegible] heat—calorimetry Gas laws and the [illegible] and changes of phase. The transmission [illegible] and heat engines. Electrostatics. Ohm's law [illegible] of electricity through liquids—electric cells [illegible] plications f Ohm's law Electromagnetism [illegible] ments and measurements. Electromagnetic induction [illegible] properties of iron. Magnetostatics. Thermoelectricity [illegible] motors and generators. Alternating currents. [illegible] Instruments for varying currents. Electronics. [illegible] Musical sounds and the science of music. Light—[illegible] Physical optics. Polarized light. Spectra—quantum [illegible] state phenomena. The electron, isotopes, and [illegible] Appendix. Index.

Note When it was first published in 1943 this textbook attracted much attention because of its various devices to make physics attractive to beginners without oversimplifying it. Among the devices employed: free use of pictorial matter and an explicit easy-to-read [illegible] this second revised edition some of the pictorial [illegible] ticularly the sequences from moving pictures f laboratory experiments, has been deleted, but the book is still printed in the large-page format, two columns to the page the typography still attractive and of course the style is still readable. The principal emphasis is on basic principles; however there are some narrative accounts of famous experiments and also some references to engineering applications. The book has been extensively revised both in text and illustrations, and printed from reset type.

Freeman, Ira M

Modern introductory physics New York McGraw Hill Book Company Inc. 1949 49[illegible] p illus 23 cm. 74[illegible]

Contents The method f science. Physics as an exact science. Force and equilibrium. Motion. Force and motion. Mechanical energy Heat energy and molecules. Rotation and vibration. Waves. The nature of light. Ray optics. Dispersion and spectra. Diffraction, interference and polarization of light. Electrostatics. Electric currents. Electromagnetism. Electrons. Isotopes, X rays, and natural radioactivity Origin and early development of the quantum theory. Waves and corpuscles, the newer quantum theory Nuclear disintegration. The structure of the nucleus. Conclusion. Appendix. Index.

Note. A college textbook specifically written for students who do not study physics as foundation for further work in science or engineering. Fewer topics are covered than in conventional texts, and most of those included are treated at an elementary level and without the use of mathematics or with no mathematics advanced than elementary algebra. However the treatment is not superficial Basic concepts are clearly explained, and such landmark experiments as Millikan's oil-drop experiment are described and their significance made clear A second edition, 497 p was published in 1957

Frye, Royal M

Essentials of applied physics. In collaboration with Robert E Hodgdon Second ed[illegible] Englewood Cliffs, N J Prentice-Hall 1954 369 p illus. 23 cm. $4 75

Contents (abridged) Foundations of mechanics. Simple machines. Fluids. Elasticity Vectors. Complete equilibrium. Uniform acceleration. Newton's second law Dynamics of rotation. Vibratory motion. Properties of waves. Production and transmission of sound. Heat and temperature. Magnetism. Static electricity Electrons in motion. Cells and simple circuits. Electromagnetism. Alternating currents. Elementary electronics. Photometry reflection and refraction of light. Lenses, optical instruments. Appendices. Index.

Note A simplified and relatively short textbook intended for use in trade schools and technical institutes rather than in full-scale college courses. Topics have been selected for inclusion, partly on the basis of their obvious relation to the everyday world. Nevertheless, modern physics has been taken into account at appropriate places in the text. Relativity and quantum mechanics are discussed briefly and special attention is devoted to the importance and definition of dimensions. The principal author is Professor of Physics in Simmons College, Boston.

HAUSMANN ERICH AND EDGAR P SLACK

Physics. Third edition. New York D Van Nostrand Company Inc., 1948. 793 p. illus. 24 cm. 744

Contents (abridged) Mechanics. Heat. Electricity and magnetism. Sound. Light. Appendix. Answers to problems. Index.

Note A widely-used college textbook. In it principles are clearly presented and are then used to explain engineering processes and machines, as well as to devise formulas for solving practical problems. In this edition considerable material has been added on new developments such as radar the betatron, and the atomic bomb and the problems supplied in the second edition have been largely replaced with new ones. A fourth edition was published in 1957 772 p., $8.00.

HOLTON GERALD

Introduction to concepts and theories in physical science. Reading Mass. Addison-Wesley Publishing Company Inc., 1952 624 p. illus. 22 cm. $7.50 745

Contents (abridged) Part I. The study of motion. Galileo and the kinematics of free fall. Projectile motion. Part II. The study of forces: Newton's laws of motion. Rotational motion. Part III. The laws of planetary motion and universal gravitation. The astronomy of ancient Greece. Copernicus' heliocentric theory. The nature of scientific theory. Kepler's laws. Galileo contribution to astronomy Newton's law of universal gravitation. Part IV On structure and method in physical science. Concepts. The growth of science. Part V. The laws of conservation. The law of conservation of matter. The laws of conservation of momentum. The law of conservation of energy. Part VI. Origins of the atomic theory in physics and chemistry. The physics of gases and of heat. The atomic theory of chemistry. Part VII. Quantum theory and the nuclear atom. Electrostatics. Properties of light. The quantum theory of light. Radioactivity and the nuclear atom. Bohr's model ... Alphabetic list of the elements. Periodic table of the elements. Summary of some trigonometric relations. Natural trigonometric functions. Common logarithms. Index.

Note A textbook which is designed for use in introductory college courses. Its organization and content reflect the critical examination of college instruction in science which has been going on in recent years under the leadership of James Bryant Conant. As the chapter titles show, selected basic concepts from both classical and present-day physics are emphasized, and there is also considerable discussion of the history of science and of scientific methods. The author is Assistant Professor of Physics and of General Education in the Physical Sciences in Harvard University.

HOWE HARLEY EARL

Introduction to physics. Second edition. New York McGraw Hill Book Company Inc., 1948 599 p. illus. 24 cm. $6.00 746

Contents (abridged) Newton's laws of force and motion. Equilibrium of a particle. The effect of force on motion. Simple harmonic motion. Equilibrium of a rigid body. The behavior of spinning bodies. Machines and friction. Forces in liquids at rest. Forces in gases at rest. Vibrations and waves. Sound and hearing. Heat and temperature. Thermal properties of gases. Change of state. Transfer of heat: radiation. The nature of electric current. Electrical quantity and electrical potential. Electric currents and magnetic phenomena. Electromagnetic induction. Electric oscillations. Light phenomena in gases. The atomic nucleus. General properties of light. Lenses. Dispersion and spectra. Diffraction and interference. Polarization. Answers to problems. Index.

Note An established presentation of classical physics, written chiefly for use in courses offered to students who are not preparing for professions which require rigorous knowledge of physical principles and techniques. The author style is clear, and the various topics are presented so as to hold the interest of the typical nontechnical student. However not a great deal of the space is given to the applications of physics. Instead, the emphasis is on the fundamental laws and phenomena. In revising the work for this edition a considerable number of changes were made.

HULL GORDON FERRIE

Elementary modern physics A revision of *An elementary survey of modern physics* New York The Macmillan Company 1949 503 p. illus. 22 cm. $6.50 747

Contents Molecules. The electron, discovery Radiation. The photoelectric effect. Orbits. Atomic spectra and the Bohr theory X-rays. Electron tubes. Electric phenomena in gases and solids. The Zeeman and Raman effects. Radioactivity Rutherford discovery of transmutation of atoms. Cosmic rays, photons or particles Transmutation of the elements. Waves and particles. Limitations imposed by nature. Fission discovered by Hahn and Strassmann. Appendix. Index.

Note A well-written introduction to modern physics, suitable for students and other readers who have completed a course in basic physics. Such topics as light pressure how the mean free path of a molecule is calculated, and nuclear fission are discussed briefly and lucidly The present edition includes much material that was not in the original edition published in 1936.

JAUNCEY GEORGE ERIC MACDONNELL

Modern physics a second course in college physics. Third edition. Princeton D Van Nostrand Company Inc., 1948 561 p. illus. 22 cm. $7.00 748

Contents (abridged) Historical introduction. Some useful mathematics. Wave motion. Alternating currents. Electromagnetic theory of radiation. Properties of moving charged bodies. The electron. Kinetic theory of gases. Specific heats and heat radiation. Electrons in metals. The photoelectric effect. Electronics and radio. Relativity —special theory X-rays. Bohr theory of spectra. The quantum theory Critical potentials. Radioactivity and isotopes. Nuclear physics. Nuclear fission. Cosmic rays. Astrophysics. Relativity—general theory Philosophical implications. Appendices. Answers to problems. Index.

Note A text for college courses offered to students who have had one-year courses in classical physics and in college mathematics. It is valuable both for students who merely want an understanding of modern physics for cultural purposes and for those who are preparing for professional work in chemistry or physics. In the preparation of this edition, some parts of the work were rearranged, and some matter that appeared in the second edition was dropped. Many passages were rewritten, and material was added on nuclear fission and on other significant developments since 1937

KOLIN ALEXANDER

Physics its laws ideas and methods New York McGraw Hill Book Company Inc., 1950 890 p. illus. 24 cm. $8.00 749

Contents Part I, Phenomenological approach to physics: Mechanics of points and of rigid bodies. Mechanics of fluids. Vector fields. Heat as a form of energy Part II, Theoretical approach to physics using mechanical model theories: A mechanical explanation of heat phenomena. A mechanical explanation of electrical phenomena. A mechanical explanation of electromagnetic phenomena. Part III, Transition from a mechanical model theory to an electromagnetic field theory: Periodic motion of matter and wave propagation in material media. Wave propagation in the hypothetical ether. Periodic motion of electric charges and propagation of electromagnetic waves. Part IV The failure of the classical mechanical and electromagnetic theories and the revision of the fundamental assumptions of physics. Inability of classical electrodynamics to explain emission and absorption of light. Replacement of deterministic description by statistical laws. Modification of our ideas on the immutability of elements and on the permanence of mass and energy Revision of our concepts of space and time. Tables. References for further study Index.

CABLE, EMMETT JAMES, AND OTHERS

The physical sciences By Emmett James Cable, Robert Ward Getchell, William Henry Kadesch, with chapters on astronomy by Harry E Crull Third edition. New York Prentice-Hall, Inc., 1951 496 p illus (part col'd) 25 cm $6 00 738

Contents (abridged) The dawn of science. Weights and measures. Energy utilized. Energy wasted. Force and motion. Fluids and fluid pressure. Building stones of matter. States of existence. The behavior of molecules. Heat as a form of energy Our atmosphere. Winds and weather. Optical instruments. Spectra. Electrostatics and magnetism. Electric currents. Electrical communication. X-rays. Radioactivity Some fundamental chemical processes. Ionization and equilibrium. Nitrogen and its compounds. The halogens. The classification of the elements. Sulfur Some common metals. Organic and food chemistry The earth and its rocks. Ground water and its work. Diastrophism, an ever-working process. Earthquakes and volcanism. The earth as an astronomical body The moon and eclipses. Other members of the solar system. The sun and its radiation. The stars and nebulae. The Milky Way and extragalactic systems. Science and the world of tomorrow Questions. References. Index.

Note. A survey of the physical sciences in language as non-technical as the subject matter permits. The book indicates the essential unity of the physical sciences and the pronounced effect they have had upon modern life. In the third edition the book has been given a larger and more attractive format, and the number of illustrations has been increased from 329 to 345 The section on astronomy has been completely rewritten and the list of questions and problems has undergone revision. The work was particularly written for use in freshman survey courses in science in teachers colleges. It may also be used to advantage by non-academic readers interested in an introductory view of the physical sciences.

CONSTANT, F WOODBRIDGE

Theoretical physics mechanics of particles, rigid and elastic bodies, fluids, and heat flow Reading, Mass Addison Wesley Publishing Company, 1954 281 p illus. 24 cm $7 50 739

Contents Part I, Vector analysis. The algebra of vectors. The calculus of vectors. Dyadics. Part II, Mechanics Velocity and acceleration. Newton's laws. The linear motion of a particle. Motion of a particle in two or more dimensions. Motion of a group of particles. Rigid bodies. Advanced dynamics. Elastic media. Elastic waves and sound. Viscous media. General principles of fluid dynamics. Part III, Heat flow References. Index.

Note. A college textbook designed for senior and first-year graduate students who have completed standard introductory courses in physics and mathematics. It is an "easy" introduction to theoretical physics rather than a full-scale treatise and is characterized by careful selection of material and patient exposition. The scope and basic ideas of theoretical physics are delineated, concepts and terms are carefully defined, and selected mathematical techniques are expounded in detail. Many of the problems illustrate applications to common problems in physics.

DURBIN, FRANK M

Introduction to physics New York Prentice-Hall, Inc. 1955 780 p illus. 23 cm. $6 75 740

Contents (abridged) Measurement and problem solving. Scalar and vector quantities. Work and energy Machines. Mechanics of liquids and gases. Uniformly accelerated motion. Rotary motion. Periodic motion. Gravitation. Heat and temperature. Change of state. Heat transfer and radiation. Vibrations and waves. Audible sound. Electricity—some fundamental principles. Magnetic and chemical effects of currents. Generation, distribution, and consumption of electrical energy The nature and measurement of light. Spectra. Interference and diffraction. Optical instruments. The physics of small particles. The electron. Electronic devices. The structure of the atom. Natural radioactivity Nuclear reactions. Appendix. Index.

Note Although the topics in classical physics which are traditionally covered in introductory courses in colleges in the United States of America are all included in this book, the treatment of them has been shortened somewhat, so as to give more than the customary space to modern physics. The treatment of the latter begins with "The physics of small particles" and includes all the chapters whose titles are listed subsequently in the above table of contents. These topics are treated at an elementary level, but the student is afforded a fair view of the scope of modern physics and offered an explanation of some of its basic concepts. The book is designed for courses offered to students who are not preparing for engineering or the physical sciences. The author is Professor of Physics in Oklahoma Agricultural and Mechanical College.

FERENCE, MICHAEL, JR., AND OTHERS

Analytical experimental physics. Third revised edition. By Michael Ference, Jr., Harvey B Lemon, and Reginald J Stephenson. Chicago University of Chicago Press, 1956. 623 p illus 26 cm $8 00 741

Contents Kinematics and statics of a particle. Dynamics of a particle—mass—force. Conservation of momentum. Work and energy Rigid bodies in equilibrium [illegible] center of mass. Rotational motion. Mechanics of fluids and measurements. Quantity of [illegible]tion. Elasticity Simple harmonic motion [illegible] kinetic theory Latent heat. Surface tension. Temperature and its [illegible] of heat. Thermodynamics heat—calorimetry Gas laws and the [illegible] resistance. Conduction and changes of phase. The transmission [illegible] Circuit theory [illegible] and heat engines. Electrostatics. Ohm's law [illegible] Direct-current [illegible] of electricity through liquids—electric cells [illegible] The magnetic [illegible] plications of Ohm law Electromagnetism [illegible] Direct-current [illegible] ments and measurements. Electromagnetic induction [illegible] properties of iron. Magnetostatics. Thermoelectricity [illegible] motors and generators. Alternating currents. [illegible] instruments for varying currents. Electronics. [illegible] Musical sounds and the science of music. Light [illegible] Physical optics. Polarized light. Spectra—quantum [illegible] state phenomena. The electron, isotopes, and [illegible] Appendix. Index.

Note: When it was first published in 1943 this [illegible] textbook attracted much attention because of its [illegible] various devices to make physics attractive to beginners without oversimplifying it. Among the devices employed [illegible] free use of pictorial matter and an explicit easy-to-read [illegible] this second revised edition some of the pictorial matter [illegible] ticularly the sequences from moving pictures of laboratory experiments, has been deleted, but the book is still printed [illegible] large-page format, two columns to the page the typography [illegible] still attractive and of course the style is still readable. The principal emphasis is on basic principles however there are [illegible] narrative accounts of famous experiments and also some references to engineering applications. The book has been extensively [illegible] both in text and illustrations, and printed from reset type.

FREEMAN, IRA M

Modern introductory physics. New York McGraw Hill Book Company Inc. 1949 45[illegible] p illus 23 cm 74[illegible]

Contents: The method of science. Physics as an exact science Force and equilibrium. Motion. Force and motion. Mechanical energy Heat energy and molecules. Rotation and vibration. Waves The nature of light. Ray optics. Dispersion and spectra. Diffraction, interference, and polarization of light. Electrostatics. Electric currents. Electromagnetism. Electrons. Isotopes, X rays, and natural radioactivity Origin and early development of the quantum theory Waves and corpuscles, the newer quantum theory Nuclear disintegration. The structure of the nucleus. Conclusion. Appendix Index.

Note: A college textbook specifically written for students who do not study physics as a foundation for further work in science or engineering. Fewer topics are covered than in conventional texts and most of those included are treated at an elementary level and without the use of mathematics or with no mathematics more advanced than elementary algebra. However the treatment is not superficial. Basic concepts are clearly explained, and such landmark experiments as Millikan's oil-drop experiment are described and their significance made clear A second edition 497 p. was published in 1957

FRYE, ROYAL M

Essentials of applied physics. In collaboration with Robert E Hodgdon. Second edition. Englewood Cliffs N J Prentice-Hall Inc., 1954 369 p illus. 23 cm. $4 75 743

ton D. Van Nostrand Company, Inc., 1951 639 p. illus. 24 cm. $7.00. 755

Contents (abridged): Length and time. Linear motion. Mass, momentum, and force. Motion in space. Some properties of matter. Mechanical energy. Wave motion. Thermal energy. Radiation. Optical instruments. Rotation. Fields of force. Electric currents and potentials. Molecules and atoms. The behavior and theory of gases. Electromagnetic induction. Atomic and nuclear structure. The behavior and theory of liquids and solids. Oscillations. Electromagnetic waves. Waves and particles. Atomic theory. Appendixes. Index.

Note: A textbook for college courses in which the authors have made a special effort to treat introductory physics from the viewpoint of present-day physicists. The conventional division into mechanics and electricity has been abandoned. Physics is presented as a unified body of thought in which there is no fundamental cleavage between classical physics and "modern" physics or between introductory physics or advanced physics. As an instance of the method may be cited the discussion of the speed of protons and the experimental methods of measuring this speed in Chapter three. Throughout the book the authors use analogies which are very helpful in presenting physical concepts and laws as logical ideas.

PERKINS, HENRY AUGUSTUS

College physics. Third edition. New York Prentice-Hall Inc., 1948 786 p. illus. (part col'd) 24 cm. (Prentice-Hall physics series Donald H. Menzel editor) $6.75 756

Contents (abridged): Part i, Mechanics. Part ii, Heat. Part iii, Wave motion and sound. Part iv, Light. Part v, Electricity and magnetism. Part vi, Corpuscular physics. Appendix. Index.

Note: An established textbook which is particularly suitable for introductory courses taken by students who are going to pursue the subject of physics further or to specialize in some branch of science where sound knowledge of physical principles is necessary. Many topics are pursued further than is customary in introductory texts, and the discussion of some subjects, for example physical optics, is unexpectedly full. Some historical material is included. Although shorter in this edition than in the preceding one, there has been a fair amount of revision which includes the introduction of new topics, such as radar, and the inclusion of others, such as cosmic rays.

RICHTMYER, F. K., AND OTHERS

Introduction to modern physics, by F. K. Richtmyer, E. H. Kennard, and T. Lauritsen. Fifth edition. New York McGraw-Hill Book Company Inc., 1955 666 p. 23 cm. (International series in pure and applied physics Leonard I. Schiff consulting editor) $8.50. 757

Contents: Historical sketch. The theory of relativity. Electrons and the photoelectric effect. The origin of the quantum theory. The nuclear atom and the origin of spectral lines. Wave mechanics. Atomic structure and optical spectra. X-rays. Wave mechanics of matter in bulk. The nucleus. Cosmic rays and fundamental particles. Appendixes. Index.

Note: A standard work, first published in 1928, and published in fourth edition in 194[illegible]. It is addressed to fourth-year undergraduate or first-year graduate students who have completed basic college courses in mathematics and classical physics. As the chapter titles listed in the above Contents show, it provides a broad view of the field. Mathematical analysis and physical descriptions are combined in the exposition. Also, considerable attention is paid to the historical development of modern physics. In this fifth edition, the book is almost 100 pages shorter than in the preceding edition. This is due to deletion of some material and condensation of some of the material carried over. The shorter length notwithstanding, the chapter entitled "Wave mechanics of matter in bulk" is new in this edition, and new matter has been added to several other chapters which have been rewritten.

RUSK, ROGERS D.

Introduction to college physics. New York Appleton-Century-Crofts, Inc., 1954 816 p. illus. 23 cm. $6.50. 758

Contents: Mechanics—the concept of force. Mechanics—the concept of energy. Properties of matter. Heat and internal energy. Vibrations, waves, sound. Electric and magnetic forces, electric currents. Electric and magnetic energy. Electric power, electromagnetic [illegible]. Electrons and nuclear physics. Light, color, spectra. Applications. Answers to problems. Index.

Note: A broad introduction to classical physics, suitable as a first college course for students who are planning to pursue additional study of science is provided in this text. In addition, there is a long chapter on the physics of electrons and nuclei. Numerous applications of physics are described, but the main emphasis is on basic phenomena and concepts. The author's style is plain and easy to read. The book is well illustrated.

SAUNDERS, FREDERICK A., AND PAUL KIRKPATRICK

College physics. Fourth edition. New York Henry Holt and Company 1953 603 p. illus. (part col'd) 24 cm. $6.25 759

Contents (abridged): Mechanics. The nature of physics. Vector quantities. Force and acceleration. Work, energy and power. Rotation. Elasticity. Fluids at rest and in motion. Heat. Kinetic theory. Heat transfer. Change of state. Heat engines. Sound. Vibrations. Sound waves. Hearing. Electricity and magnetism. Currents and charges. Elementary electrostatics. Magnetism. Conductors and circuits. Induced currents. Generators and motors. Electron properties. Electric oscillations and waves. Light. Reflection and refraction of light. Lenses and curved reflectors. Dispersion and spectra. Color and interference. Polarization of light. Atomics. Relativity. Waves and particles. Atomic nuclei. Nuclear reactions. Appendix. Index.

Note: A standard textbook whose scope and organization is based on an extensive experience in teaching physics to college students. It presents an introductory exposition of classical physics and is written in a lucid style. It is a new and much revised edition of the senior author's *A survey of physics* of which the first edition was published in 1930 and a third edition in 1943. The 30-page terminal section on atomic physics is new in this edition. Most of the other sections also contain newly added material.

SEARS, FRANCIS WESTON, AND MARK W. ZEMANSKY

College physics. Second edition. Reading Mass. Addison-Wesley Publishing Company Inc. 1952 912 27 p. illus. (part col'd) 24 cm. (Addison-Wesley physics series Francis Weston Sears, consulting editor) $8.50 760

Contents (abridged): Composition and resolution of vectors. Friction. Rectilinear motion. Newton's second law. Motion of a particle. Work and energy. Impulse and momentum. Circular motion. Rotation. Elasticity. Harmonic motion. Hydrostatics. Hydrodynamics and viscosity. Temperature. Transfer of heat. The first law of thermodynamics. Thermal properties of matter. The second law of thermodynamics. Wave motion. Vibrating bodies. Acoustical phenomena. The electric field. Potential. Properties of dielectrics. Current and resistance. Principles of electrochemistry. The magnetic field. Induced electromotive force. Magnetic properties of matter. Capacitance and inductance. Alternating currents and electromagnetic waves. Electronics. The nature and propagation of light. Lenses and lens aberrations. Optical instruments. Illumination. Color. Interference and diffraction. Polarization. Spectra and atomic physics. Radioactivity and nuclear physics. Tables. Index. Answers to problems.

Note: A textbook for use in two-year courses. In it basic principles are developed with little attention to the practical applications or the historical background of the subject. Abridged from the authors' *Principles of Physics* which was developed for a two-year course in physics at the Massachusetts Institute of Technology; the first edition of this title was published in 1947. The present edition includes newly added material on surface tension, the kinetic theory of gases, convection coefficients, acoustical phenomena, electricity and light, and a new set of problems.

SEARS, FRANCIS WESTON

Mechanics, heat and sound. Second edition. Reading, Mass. Addison-Wesley Publishing Company Inc., 1950. 527 p. illus. 23 cm. $8.50 761

Contents: Composition and resolution of vectors. Statics. Moments—center of gravity. Linear motion. Newton's second law. Motion of

Note An introductory textbook developed at the University of Chicago. The basic phenomena and laws usually presented in a textbook for first college courses are covered, but the applications introduced are largely biological. This emphasis and the attention given to the scientific method suit the book to the needs of students whose main interest is biology or some area of science other than physics. However the physics content of the book has not been skimped, nor are physical ideas treated superficially

LEMON, HARVEY BRACE

From Galileo to the nuclear age, an introduction to physics Revised edition of "From Galileo to cosmic rays" Photographs by the author, drawings by Chichi Lasley Chicago The University of Chicago Press, 1946 451 p illus 23 cm $7 00 750

Contents (abridged) Part I, Mechanics Galileo and the principle of inertia. Newton's first two laws of motion. Paths of projectiles. Balanced forces and Newton third law of motion. Applications of the law of conservation of momentum. Energy potential and kinetic. Power Our two oceans—atmosphere and hydrosphere. Part II, Heat Temperature and expansion. Quantity of heat and temperature. The kinetic theory of heat. Part III Electricity and magnetism Conduction induction. Thunderstorms. Artificial production of charge. Magnetism. The energy of electric and magnetic fields. Part IV Electricity and matter Conductors, solid and liquid. The conduction of electricity by gases. Cathode rays. Electrons their mass and velocity Positive rays, protons, neutrons, and isotopes. Radioactivity and transmutation. Part V Waves and radiation About wave phenomena in general. On sound. Electromagnetic waves. Visible light. Radiation and atomic structure. Index.

Note Although planned primarily as a textbook, this work is also suitable for adult readers studying by themselves. Th style is light, almost conversational and it is supplemented by an abundance of ingeniously conceived illustrations. In comparison to the first edition, published in 1934 this one is not greatly changed except for about 20 inserted pages on new atomic particles and occasional paragraphs on new applications, such as radar

LINDSAY, ROBERT BRUCE

Concepts and methods of theoretical physics Princeton D Van Nostrand Company, Inc 1951 515 p 23 cm $7.25 751

Contents The nature of theoretical physics. Part I, Particle physics Kinematics—the geometry of motion. Concepts of the theory of mechanics—the principles of dynamics. Motion of particle in a straight line—oscillations. Motion of particle in a plane. Motion of collection of particles. Dynamics of a rigid body Minimal principles—Lagrange's equations. The transformation theory of mechanics—atomic structure. Statistical mechanics and thermodynamics. Quantum theory Part II, Field physics Scalar and vector fields. Deformable material media and tensor fields. Wave motion in solid and fluid media. The electromagnetic field. Electromagnetic radiation. Electron theory and relativity Problems. Index.

Note This book is a text for upperclass undergraduate college students who are majoring in physics. The author has assumed that his readers will have completed courses in advanced calculus and elementary partial differential equations. For readers with the necessary preparation the book provides an introductory and fairly simple treatment of some of th basic ideas and the chief mathematical techniques of present-day physics.

MCCUE, J J G

The world of atoms an introduction to physical science By J J G McCue, with the assistance of Kenneth W Sherk. New York The Ronald Press Company 1956 659 p illus 23 cm. $6 50 752

Content (abridged) Mechanics. Heat. Foundations of chemistry Some chemical reactions. Electricity Solutions. The classification of the elements. The structure of atoms. Chemical binding. The atomic nucleus. Appendix. Index.

Note A college textbook in physics. It covers the traditional ground of introductory courses in American colleges. However as the title is meant to indicate there is more than the usual emphasis on atomic physics. The arrangement is chronological but not rigidly so, and there is emphasis on the succession of experiments and ideas that led to the present body of basic physical knowledge. Some applications of physics are discussed, but they do not dominate the fundamental material. The author was formerly Associate Professor of Physics on the faculty of Smith College, and Professor Sherk is presently Professor of Chemistry in the same college.

MARGENAU, HENRY, AND OTHERS

Physics, principles and applications. By Henry Margenau, William W Watson and C G Montgomery Second edition New York McGraw Hill Book Company, Inc., 1953 714 p illus 23 cm $7 75 753

Contents (abridged) The methods of physics. Introduction to mechanics. Description of motion—kinematics. Force and acceleration—dynamics. Dynamics of a rigid body Motions under inverse-square laws of force. Oscillations. Hydrostatics. Hydrodynamics. Intermolecular forces. Temperature and thermal expansion. Calorimetry Change of state. Kinetic theory The laws of thermodynamics. Transfer of heat. Meteorology The electric field and potential. Electric currents. Chemical and thermal electromotive forces. Magnetic forces on currents. electrical instruments. The magnetic field produced by currents. The magnetic properties of matter Alternating currents. Electronics. Wave motion. Production and reception of sound. The nature of light. Optical instruments. Spectra and color Radiant energy Atomic structure. Nuclear physics. Appendixes. Index. Index of tables. Answers to problems.

Note A college textbook written by present and former members of the Department of Physics of Yale University The authors' purpose was to present an account of physics which is "rigorous, vital, and modern. The treatment of certain topics in the second edition has been simplified somewhat, but the book is still more comprehensive and advanced than the usual run of introductory texts. Calculus is employed freely in the exposition and is required for solving many of the problems. Except for instruments, there is little discussion of the applications of physics. The first edition was published in 1949 Various sections of the book were rewritten, some sections were deleted, and discussions of number of new topics, such as the Schmidt camera and the transistor, have been added in this edition. Also, changes have been made in the problems included for students to solve.

MENDENHALL, C E, AND OTHERS

College physics. Fourth edition By C. E Mendenhall A. S Eve, D A Keys, R. M Sutton Boston D C Heath and Company 1956 660 p illus 23 cm $6 75 754

Contents (abridged) Statics. Force and motion. Energy and power Friction and machines. Curvilinear motion. Rotation. Elasticity Gravitation. Hydrostatics. Mechanics of gases. Hydrodynamics. Vibrations and oscillations. Wave motion and sound. The measurement of temperature. Kinetic theory of gases. Mechanical equivalent of heat. Transfer of heat. Magnetism. Electrostatics. Condensers and capacitance. Current electricity Magnetic fields and motion. Electromagnetic induction. Conduction of electricity through gases. Radio. The nature of light and photometry Lenses. The eye and vision Optical instruments. Polarization of light. Photoelectricity Radioactivity Atomic structure. Nuclear physics and atomic energy Appendix. Answers to problems. Index to tables in text. Index to text.

Note A long-established (the first edition was published in 1935) textbook for introductory college courses The mathematical requirements are simple. The reader's interest is stimulated by the use of many pictures and by mentions of applications of physical principles in familiar machines and devices. The traditional topics of introductory courses in classical physics are discussed in somewhat more detail than in many textbooks of more recent origin. On the other hand, the concepts of atomic and nuclear physics are not introduced until the last three chapters and are then treated very briefly In comparison to the third edition, the fourth edition does not represent a major revision, although important changes have been made in various sections of the text and in the illustrations. The attractive format of the third edition has been retained.

MICHELS, WALTER CHRISTIAN, AND A L PATTERSON

Elements of modern physics Illustrations by Richard Barbera and George Berk. Prince

SLATER, JOHN C.

Modern physics. New York McGraw Hill Book Company 1955 332 p. illus. 24 cm. $6.00. 767

Contents: The atom in nineteenth-century physics. The electron theory and relativity. Beginning of the quantum theory. The nuclear atom. The Bohr atom. X-rays and crystal structure. Atomic spectra and the periodic system of the elements. Complex spectra and molecular spectra. Wave mechanics. Atoms, molecules, and solids. Nuclear physics and high-energy particles. Appendixes. Index.

Note: An elementary lucidly written account of the great development in physics in our century. The author himself describes it as [illegible] history of the development of ideas that together with only enough theory to make it comprehensible. Some mathematics is employed, but the book is written so that these parts may be skipped if necessary. It is organized as a textbook, and the intended audience includes college students, graduate and undergraduate, who are not physics majors but who recognize the need of some understanding of quantum mechanics, atomic particles, nuclear fission, etc. The author, a widely known mathematical physicist, is a member of the faculty of Massachusetts Institute of Technology.

SMITH, ALPHEUS WILSON

The elements of physics. Fifth edition. New York McGraw Hill Book Company, Inc., 1948 745 p. illus. (part col'd) 24 cm. $6.50 768

Contents (abridged): Part I, Mechanics. Part II, Wave motion and sound. Part III, Heat. Part IV, Magnetism and electricity. Part V, Electronics. Part VI, Physical and geometrical optics. Part VII, Radiation and atomic structure. Appendixes. Index.

Note: This textbook has been widely used in American universities and colleges since the publication of the first edition in 1923. The author's method is to impart a thorough understanding of the fundamental physical principles and phenomena by showing their many applications. Along with the basic theory are several descriptions and illustrations of interesting devices based on physics are included. A fair amount of new material has been added in the present edition. There are an entirely new chapter on [illegible] and numerous shorter articles on recent developments, particularly in atomic physics and electronics. There are now more than 900 illustrations.

SPROULL, ROBERT L.

Modern physics: a textbook for engineers. New York John Wiley & Sons, Inc., 1956 491 p. illus. 24 cm. $7.75 769

Contents: Fundamental particles. Assemblies of particles. Atoms and nuclei. Wave-particle experiments. Introductory quantum mechanics. Atomic structure and spectra. Molecules. Binding and energy bands in solids. Electrical, thermal, and magnetic properties of solids. Imperfections in solids. Semiconductors. Physical electronics. Applied nuclear physics. Appendixes. Index.

Note: Primarily a college text, this book consists of expositions of topics selected from atomic physics, nuclear physics, solid state physics, quantum mechanics, etc. It is addressed to such readers as last-year graduate students and graduate engineers, and a grasp of classical physics and college mathematics on the part of the reader has been assumed. The author's approach to most topics is analytical but without emphasis on mathematical analysis. Also, he has not hesitated to lighten the exposition with occasional descriptive passages. Selected literature references, most of them to books, are included.

SUTTON, RICHARD MANLIFFE, editor

Demonstration experiments in physics. New York McGraw Hill Book Company Inc., 1938. 545 p. illus. 23 cm. $7.50 770

Note: A collection of nearly 1,300 lecture experiments in physics prepared under the auspices of the American Association of Physics Teachers, with contributions from 200 physicists in 130 institutions. Contains many familiar experiments and many new ones designed to illustrate the principles of physics as taught in high school and college courses.

WATERMAN, ALAN T

Arthur L. Kimball's College textbook of physics. Sixth edition revised by Alan T Waterman. New York Henry Holt and Company 1954 942 p. illus 24 cm. $7.95 771

Contents (abridged): Aim and method of physical science. Fundamental conceptions. Units and measurements. Mechanics. Mechanics of liquids and gases. Properties of matter and its internal forces. Wave motion and sound. Heat. Magnetism. Electrostatics. Electric currents or electrodynamics. Light. Modern physics. Appendix. Index.

Note: First published in 1911, this textbook, under the name of the original author, was widely used in colleges and universities in the United States of America for approximately four decades. It held its place partly because of its logical organization, but primarily because of the author's clear and explicit style. The original style has been retained in this major revision done by the Director of the United States National Science Foundation, and the book is still primarily an exposition of classical physics with five chapters that serve as a preview of modern physics. However extensive revisions have been made in the text, illustrations, and problems.

WHITE, HARVEY E.

Descriptive college physics. Princeton D Van Nostrand Company Inc. 1955 485 p illus. (part col'd) 23 cm. $5.75 772

Contents (abridged): Mechanics: Units of measurements. Newton's laws of motion. Forces, vectors, and center of gravity. Conservation of energy and momentum. Properties of matter. The atomic theory of matter. Fluids in motion. Heat: Temperature and expansion. Heat transfer. Change of state and low temperatures. Sound: Vibrations and waves. Musical instruments. Light. Electricity and magnetism. Atomic physics: The discovery of electrons. The discovery of atoms. Atoms and their spectra. Nuclear Physics: Radioactivity. Atomic collisions and nuclear disintegrations. Cosmic rays. Atomic accelerators. Atomic energy. Appendices. Index.

Note: Specifically planned as an informative exposure to physics for college students who are not preparing for careers in the physical sciences, this book is a descriptive treatment, as stated in the title. The nature and scope of classical and modern physics is delineated in terms of physical concepts and by the use of well-described analogies. Almost no mathematics is used. The volume is thoroughly illustrated and many of the illustrations are [illegible] of lecture demonstrations. The section on atomic physics is 130 pages long and is one of the book's main features.

WHITE, HARVEY E.

Modern college physics. Third edition Princeton D Van Nostrand Company Inc., 1956 824 p. illus. (part col'd) 23 cm. $6.75 773

Contents (abridged): Mechanics. Properties of matter. Heat. Sound. Light. Electricity and magnetism. Atomic physics. Electronics. Quantum optics. Nuclear physics. Appendices. Index.

Note: A successful textbook used in full-length, introductory college courses. It is specifically designed for the instruction of students who are preparing to major in a physical or biological science. Among the chapters on conventional topics are interspersed chapters on such topics as aeronautical mechanics and optical instruments, and even the chapter on heat contains a tabulation of the "heat content of average servings of food." Nevertheless, the main emphasis is on the principles of classical physics and atomic physics. The first edition under this title was published in 1948, and the second edition in 1952. The main changes in this second edition are in the problems, of which many new ones have been added, and in the treatments of atomic and nuclear physics, which have been revised to bring them up to late 1955. The author is Professor of Physics in the University of California.

WHITE, MARSH W., AND OTHERS

Practical physics. By Marsh W White, Kenneth V Manning and Robert L. Weber Second edition. New York McGraw Hill Book Company Inc., 1955 484 p illus. (part col'd) 23 cm. $5.30 774

a projectile. Center of mass. Work and energy Impulse and momentum. Circular motion. Moment of inertia. Rotation and translation. Elasticity Harmonic motion. Gravitation. Hydrostatics and surface tension. Hydrodynamics and viscosity Temperature—expansion. Quantity of heat. Transfer of heat. Change of phase. Properties of gas—the ideal gas. Real gases. The second law of thermodynamics. Kinetic theory of gases. Wave motion. Vibration of strings and air columns. Sound waves. The ear and hearing. Index.

Note An outstanding textbook designed for use in first courses in physics offered to college students who are planning to specialize in a physical science or engineering. It is primarily concerned with principles, little space being given to practical applications. Many of the problems are identical with those used in examinations given in the course taught by the author at the Massachusetts Institute of Technology The volume is very well illustrated.

SEARS, FRANCIS WESTON, AND MARK W ZEMANSKY

University physics, complete edition Second edition with supplementary problems Reading, Mass Addison Wesley Publishing Company, Inc., 1955 1,031 p illus. (part col'd) 23 cm $9 50 762

Contents (abridged) Mechanics. Heat. Sound. Electricity and magnetism. Optics. Atomic physics. Answers to problems. Conversion factors. Index.

Note An introductory textbook of comprehensive scope designed for use in full-length courses offered to undergraduate college students who are preparing for further work in physics or in another physical science or in engineering. It is based on the author's three-volume *Principles of physics* but differs from that work largely in that the treatment does not assume that the reader has completed a course in calculus. Calculus is used in the exposition, but the book is so arranged that it can be studied concurrently with an introductory course in calculus. As in *Principles of physics*, the primary emphasis is on fully detailed exposition of fundamental principles. The first edition was published in 1949 A number of changes were made in its text in preparing the second edition. These included the addition of new topics and revised treatments of some others. New problems were appended to the chapters, but the long section of supplementary problems has been reprinted without change from the first edition.

SEMAT, HENRY

Fundamentals of physics. Revised edition. New York Rinehart & Company, Inc., 1951 849 p illus 24 cm. 763

Contents (abridged) Part I, Mechanics Forces and equilibrium. Motion of a particle. Periodic motion. Work and energy Fluids at rest. Fluids in motion. Properties of matter Rotational motion. Part II, Heat: Heat and work. Kinetic theory of matter Change of phase. Transfer of heat. Heat engines. Application to meteorology Part III, Wave motion and sound. Part IV Electricity and magnetism Magnetism. Electrostatics. The electric circuit. Electrochemical effects. Electromagnetic effects. Electromagnetic induction. Alternating currents. Electrical communication. Part V Light Photometry Reflection and refraction. Optical instruments. Light as a wave motion. Part VI, Atomic physics Charged particles. Spectra and atomic structure Nuclear physics. Appendices. Tables. Glossary Index.

Note. The first edition of this college textbook was the result of planned effort to produce small book in which brevity was achieved largely by selection of the topics to be discussed. In the present revision that idea has been abandoned, and the book is comparable in scope to other introductory texts intended for courses of standard length. The emphasis is on basic principles and phenomena and applications are mentioned only incidentally The author is Professor of Physics in the College of the City of New York. A third edition, 914 p., $9.00, was published in 1957

SEMAT, HENRY

Physics in the modern world New York Rinehart & Company Inc. 1949 434 p. illus 23 cm. $6 00 764

Contents: Part I, Motion and energy: Motion. Force and motion. Work and energy Fluids and motion. *Part II, Power Sources of power* Heat and work. Electric power Part III, Radiant energy Sources of radiant energy Utilizing light. Communication. Part IV The atomic world. Structure of the atom. Nuclear energy Appendices Suggestions to teachers and students. A list of books for supplementary reading Tables. *Glossary Answers to problems.* Index.

Note Planned specifically as a text for use in courses in physics offered to students *who are not preparing for careers in science*, this book contains the traditional descriptions and illustrations of applications of physics, portraits and biographical notes on physicists, and simple exercises of such texts. On the other hand, there is due emphasis on fundamental principles. A knowledge of elementary algebra is all the mathematics required. The author is Professor of Physics in the College of the City of New York.

SHORTLEY, GEORGE, AND DUDLEY WILLIAMS

Elements of physics for students of science and engineering Second edition New York Prentice-Hall, Inc., 1955 880 xviii p illus 23 cm $8 75 765

Contents (abridged) Part I, Mechanics Scalar and vector quantities displacement, force, torque. Statics. Kinematics of translational motion Dynamics of a particle. Work, energy and power Mechanics of fluids. Elasticity and strength of materials. Rotational motion. Mechanics of rigid bodies. Periodic motion. Part II Heat Calorimetry Heat transfer Properties of gases. Solids, liquids, and gases. Thermodynamics. Part III, Wave motion and sound. Part IV Light Illumination and photometry Reflection of light. Refraction of light. Physical optics. Dispersion and spectra. Part V Electricity and magnetism Electrostatics. Capacitance. Current electricity Electrochemistry—thermoelectricity Magnetic effects of electric currents. Alternating-current circuits. Part VI, Modern physics. Electromagnetic waves—photons—electrons. Nuclear physics. Appendix. Index.

Note. A carefully written, full-length introductory textbook. As *indicated in the subtitle, it is addressed to students who will do* further work in science or engineering, rather than to those who *are studying the subject for cultural reasons.* Much attention is given to definitions, which are stated in operational terms. Most of the space is devoted to classical physics, with a brief introductory view of modern physics at the end of the book. A large number of problems for students to solve is included. A first edition was published in 1953 Revisions and additions in this second edition are so numerous that it was printed from reset type.

SHORTLEY, GEORGE, AND DUDLEY WILLIAMS

Physics fundamental principles for students of science and engineering Englewood Cliffs, N J Prentice Hall Inc., 1950. 2 v illus. 23 cm Vol I $5 75, vol II $6 75 766

Contents. Volume I. Part I, Mechanics Scalar and vector quantities, displacement, force, torque. Statics. Statics of fluids. Kinematics. Dynamics. Work, energy and power Rotational motion. Elasticity and strength of materials. Impacts and conservation of momentum. Vibratory motion *Fluid dynamics. Gyroscopic motion.* Part II, Heat Temperature thermal expansion Calorimetry Heat transfer Properties of gases. Solids, liquids, and gases. Thermodynamics. *Appendix. Index. Volume II, Part III,* Sound Wave motion. Production of sound. Properties of sound waves. Part IV Light The nature of light and its propagation. Illumination and photometry Reflection and refraction of light. Optical instruments. Interference and diffraction of light. Dispersion, spectra, and color Polarization of light. Emission and absorption of radiation. Part V Electricity and magnetism Electrostatics. Condensers. Direct electric currents. Electrochemistry Thermoelectricity *Magnetic effects of electric currents. Ferromagnetism* permanent magnets the earth's field. Ideal magnetic materials the magnetic circuit real magnetic materials. Electromagnetic induction. Alternating-current circuits. The fundamental electrical units. Electrical measuring instruments. Part VI, Modern physics Electronics. Electromagnetic waves. Elementary particles. Appendix. Index.

Note A thorough and rigorous introduction to classical physics, designed for the instruction of college students who are preparing for careers in science or engineering. Although the main emphasis is on principles, applications in such basic devices as radio communications systems are described. Throughout both volumes, the discussions are exceptionally full. The authors are Professors of Physics in Ohio State University

Tubes densimeter (experimental model). Discussion. Interpretation of the results of the tests.

Note: Preface: At the request of the American Society for Testing Materials, a critical study was made (by the National Bureau of Standards) of the commercial instruments for the determination of the specific gravities of gases. Eleven different instruments were studied with the use of 15 test gases of known specific gravities. Determinations were made of the accuracy and reproducibility of the effects of changes of temperature, relative humidity and water content of the surrounding air, and of sources of error and applicable corrections. It is believed that the results herein presented will be of considerable value to those requiring accurate data on the specific gravity of gases.

STRONG, JOHN, AND OTHERS

Procedures in experimental physics, by John Strong in collaboration with H. Victor Neher, Albert E. Whitford, C. Hawley Cartwright, and Roger Hayward. Illustrated by Roger Hayward. New York, Prentice-Hall, Inc., 1938. 642 p. illus. 23 cm. (Prentice-Hall physics series, E. U. Condon, editor) $7.50. 781

Contents: Fundamental operations in laboratory glass blowing. Laboratory optical work. Technique of high vacuum. Coating of surfaces. Evaporation and sputtering. Use of fused silica. Electrometers and electroscopes. Geiger counters. Vacuum thermopiles and the measurement of radiant energy. Optics. Light sources, filters, and optical instruments. Photoelectric cells and amplifiers. Photography in the laboratory. Heat and high temperatures. Notes on the materials of research. Notes on the construction and design of instruments and apparatus. Molding and casting. Rubber and some index.

Note: The authors endeavored to bridge the gap between laboratory demonstrations and experiment, and theoretical teaching, by collecting and co-ordinating up-to-date methods of experimental procedure and presenting them in easy to follow form. Procedures, apparatus, and techniques are described, and the sources of supplies are given. Over 400 drawings present graphic demonstrations.

THOMAS, JAMES LOUIS

Precision resistors and their measurement. Washington, D. C., Government Printing Office, 1948. 32 p. illus. 26 cm. (United States. National Bureau of Standards. Circular 470) $0.20. 782

Contents: Introduction. Resistance materials and construction methods. Methods of comparison of resistors. Special apparatus for precision measurements. Calibration of precision bridges. Resistivity of solid conductors. References.

Note: The Wheatstone bridge in one or another of its several forms is almost universally used in scientific investigation when accurate measurement of electrical resistance is required. This circular supplies information on the use and practical limitations of resistance-measuring bridges for persons interested in accurate measurement of electrical resistance. It also presents methods for the direct-current calibration of such bridges, the methods described being those regularly used at the National Bureau of Standards when an accuracy of 0.01 percent or better is required.

WHITEHEAD, T. N.

The design and use of instruments and accurate mechanism: underlying principles. New York, Dover Publications, Inc., 1954. 283 p. illus. 21 cm. $1.95. 783

Contents: Instruments and their parts. Part 1, The theory of errors. Systematic errors (false elements). Probability as applied to errors. Short period errors (disturbed elements). Erratic errors (incomplete elements). Conclusions of Part 1, and an example. Part 2, Design. Precision—kinematic design—semikinematic design. Stiffness, balance, and protection of elements. Accuracy. The planning of an instrument. The human factor. Index.

Note: A classic work, first published in 1934, its primary subject is instrumental errors. The author's approach is both physical and mathematical; however, physical concepts and terms predominate. Hence, the book can be read with profit by instrument designers whose knowledge of mathematics is slight. Part 1 is devoted to analyses of the kinds of errors that occur in instruments and to their causes. In this part, the author states: "The central problem in design is first to try to eliminate errors; secondly to persuade such as remain to figure in measurements as systematic or unbiased errors; and thirdly to provide the necessary facilities to enable the observer to cope successfully with these two classes." In Part 2, the author has illustrated the application of the basic theory to typical mechanisms, not as a guide to actual design of mechanisms, but as further exposition of the basic thesis. Except for a new preface and revisions of minor errors, the text of this "second printing" is the same as that of the first edition.

WEIGHTS AND MEASURES

LASHOF, T. W., AND L. B. MACURDY

Precision laboratory standards of mass and laboratory weights. Washington, D. C., Government Printing Office, 1954. 24 p. illus. 26 cm. (United States. National Bureau of Standards. Circular 547, section 1) $0.25. 784

Contents: Introduction. Classification of weights. Requirements for precision laboratory standards of mass—classes J, M, S, and S-1. Requirements for laboratory weights—classes P, Q, and T. Weight calibration service of the National Bureau of Standards. Regulations governing the submission of weights to the National Bureau of Standards for test. Suggestions for the purchase of weights meeting this specification. Appendices: Conversion factors for units of mass. Units and abbreviations for marking weights.

Note: This publication presents the specifications of the National Bureau of Standards for precision laboratory standards and other laboratory weights. It also presents the regulations governing the submission of these weights to the Bureau for test, and outlines the weight calibration service of the Bureau. It supersedes parts of Circular 3, *Design and test of standards of mass*. Other parts of Circular 3 will be superseded by forthcoming sections of Circular 547.

NATIONAL CONFERENCE ON WEIGHTS AND MEASURES

Specifications, tolerances, and regulations for commercial weighing and measuring devices. Second edition. Washington, D. C., Government Printing Office, 1955. 196 p. 20 cm. (United States. National Bureau of Standards. Handbook 44) $2.00. 785

Contents (abridged): Introduction. Fundamental considerations associated with the enforcement of specifications, tolerances, and regulations. Specifications, tolerances, and regulations: General code. Scales. Weights. Liquid-measuring devices. Vehicle tanks. Farm milk tanks. Liquid measures. Graduates. Measure-containers. Milk bottles. Lubricating-oil bottles. Linear measures. Fabric-measuring devices. Cordage-measuring devices. Mileage-measuring devices. Definitions. Specifications. Tolerances. Regulations. Dry measures. Index of definitions. Appendix: Tables of United States customary weights and measures. Notes on British weights and measures tables. Tables of metric weights and measures. Tables of interrelation of units of measurement. Tables of equivalents.

Note: The specifications, tolerances, and regulations given in this handbook are recommended by the National Bureau of Standards for official promulgation in, and use by, the states of the United States of America in exercising their control of commercial weighing and measuring apparatus. The National Conference on Weights and Measures is a body made up of state and local weights-and-measures officials from all parts of the United States, which normally meets annually at the National Bureau of Standards, Washington, D. C. This second edition of Handbook 44 supersedes Handbook 44, published in 1949. It contains the codes adopted by the Conference in 1955. The publication is available in the cloth-bound edition listed above and also in a loose-leaf format, price $3.00. Replacement sheets showing amendments and additions are available for the latter.

Contents (abridged) Physics, the science of measurement. Heat. Properties of matter Mechanics. Sound. Electricity Light and modern physics. *Experiments. Appendix.* Index.

Note A concise, simplified treatment of general physics, designed primarily for use in courses in colleges, technical institutes, and other educational and training efforts directed towards students whose interests in physics are practical. Only elementary algebra and trigonometry are used, and even these mathematical concepts are introduced in such a way that the reader can review them concurrently with the study of the book. The first edition was published in 1943 Three chapters have been added, and many other changes important from the pedagogical standpoint have been made in this edition. The authors are members of the faculty of the University of Pennsylvania.

WINANS, JOHN GIBSON

Introductory general physics. New York Ginn and Company, 1952 *765 p illus 24 cm* $6.25 775

Contents (abridged) Words and measurements. The algebra and geometry of physics. Work and power. Efficiency of machines. Forces acting on liquids at rest. Gases. Molecular forces. Vectors. Vector equations and *projectile motion Newton's laws of motion.* Rotational motion. Combinations of rotational and translational motion. Sound waves and their sources. Heat. The molecular theory of matter Magnetism. Electricity in motion. Chemical effects of electricity Magnetic effects of electric currents. Electric waves. Radio. The conduction of electricity through gases. The intensity of light. The velocity of light. Optical instruments. Color and the spectrum. Atomic energy Appendix. Index.

Note The first edition of a college textbook which has a number of notable features. The concept of a vector is introduced early and is employed throughout most of the book. The numerous illustrations are well chosen. Outstanding are the numerous graphical demonstrations of physical principles and the reproductions of photographs of physical experiments. Discussions of recently developed devices such as the transistor are included. Although typical applications are described, the book is not a descriptive text in the usual sense of that term. However the mathematics is simple.

LABORATORY TECHNIQUES

DUSHMAN, SAUL

Scientific foundations of vacuum technique. New York John Wiley & Sons, Inc., 1949 882 p illus. 24 cm. $16 00 776

Contents Kinetic theory of gases. *Flow of gases through tubes* and orifices. Mechanical pumps. *Steam-jet ejectors* and mercury vapor pumps. Vapor pumps using *organic liquids. Manometers for* low gas pressures. Sorption of gases and vapors by solids. Sorption of gases by "active" charcoal, silicates (including glasses) and cellulose. Gases and metals. Chemical and electrical clean-up of gases at low pressures. Vapor pressures and rates of evaporation Dissociation pressures of oxides, hydrides, and nitrides and rates of oxidation *Significance of reference abbreviations. Name index* Subject index.

Note Although pumps and other apparatus used in the production and measurement of high vacua are thoroughly described as to principles, characteristics and limitations, this book is not primarily description of apparatus and its manipulation. Rather it is a presentation of fundamental information from the fields of physics, chemistry and metallurgy which has application to high vacuum technique. It is written on professional level and is intended for scientists and engineers. There are numerous footnote references to the pertinent literature. It contains much more material than was contained in the author's *Production and measurement of high vacuum,* Schenectady N Y 1922.

HELDMAN, JULIUS DAVID

Techniques of glass *manipulation* in scientific *research. New York* Prentice Hall, Inc. 1946 132 p. illus 23 cm $3 00 777

Contents Properties of glass. Flames and torches. Equipment Basic operations. Blowing *involving one piece of glass. End and T* seals. The triple, ring, or inner seal. The Dewar seal. Use of the hand torch. Other operations. *Glass-to-metal seals. Finished-equipment exercises.* Glossary Index.

Note This book is designed for workers in scientific laboratories who may need to repair chemical glassware or to construct simple pieces. The author has included very detailed instructions on how to cut, bend, shrink, bulge, flange, and polish glass tubing. The reader is shown, step by step, how to make elbows, ties, wyes, coils, condensers, aspirators, manometers, McLeod gauges, diffusion pumps, and other glass equipment. The glossary includes a page of information on the trade names and kinds of glass that should be used.

KORFF, SERGE A

Electron and nuclear counters, theory and use. With chapter on scintillation counters by H Kallmann *Second edition Princeton* D Van Nostrand Company, Inc., 1955 363 p. illus 22 cm $6 75 778

Contents Introduction. Ionization chambers. Proportional counters. *Geiger counters. Preparation* and construction of counters. Errors and corrections in counting. *Auxiliary* electronic circuits. Scintillation counters, by H. Kallmann. References. Appendices. Author index. Subject index.

Note An introduction to the subject and reference handbook for physicists and other persons with scientific or engineering training *who are interested in the use of electron* and nuclear counters in research work. It covers basic theory and phenomena, design and construction, auxiliary circuits and practical uses, including the important subject of corrections for errors. The first edition was published in 1946. In this second edition, the book has been extensively revised, and its length substantially increased. In addition *to the new chapter by H. Kallmann,* mentioned in the title, the chapter on errors and corrections contains a new 11-page discussion of errors on counting written by *Professor* Yardley Beers of New York University *Among* other changes, the literature references have been revised, and a list of suppliers of equipment in the United States of America and in England has been added.

ROSSI, BRUNO B , AND HANS H STAUB

Ionization chambers and counters, experimental techniques New York McGraw Hill Book Company, Inc 1949 243 p illus. 24 cm. (National nuclear energy series Manhattan Project technical sections. Division v— vol. 2) $3.25 779

Contents Behavior of free electrons and ions in gases. Operation of ionization chambers with constant ionization *Operation* of ionization chambers with variable ionization. Gas multiplication. Beta-ray Gamma-ray and X-ray detectors. *Alpha-particle* detectors. Detectors for neutron recoils. *Detection of (n,α) and (n,p) reactions. Fission* detectors. Appendix. Index.

Note Based on work done under the *Manhattan District Project* in connection with the development of the atomic bomb, this book presents—as do the others in the series—a selection of material which has potential nonmilitary uses and is of general scientific interest. The first four chapters deal with ionization phenomena and the general principles upon which detectors and counters are based. *The remainder is devoted to descriptions of specific types of counters* which were developed mainly at the Los Alamos Laboratory The volume is of interest to research chemists and physicists working with radio-active substances.

SMITH, FRANCIS ALBERT, AND OTHERS

Tests of instruments for the determination indication or recording of the specific gravities of gases by Francis A. Smith John H *Eiseman and E* Carroll Creitz. Washington, D C Government Printing Office, 1947 143 p. illus 24 cm (United States. National Bureau of Standards Miscellaneous publication *M177)* $1 00 780

Contents Introduction *History* of the project. Definitions. Equipment Laboratory facilities. Test gases. Instruments studied. Plan of the tests: *Methods.* Corrections applicable and their evaluation. Results of tests of individual instruments Pressure balances. Arndt portable gas balance *Ac Me recording gravitometer no. 111* Arndt recording gas gravitometer *Sigma recorder no. 1 for specific gravity* Metric indicating gravitometer Ranarex specific gravity recorder no. A2160 and portable specific gravity indicator no. P1184.

Mechanics

Contents. Hydrodynamical paradoxes. Recent progress in free boundary theory. Modelling and dimensional analysis. Group theory and fluid mechanics. Virtual mass and groups. Bibliography. Index.

Note: An unusual book in which the author examines a number of noted paradoxes in fluid mechanics, shows "plausible reasoning" is not applicable in many hydrodynamic situations, discusses theory and practice in the use of models and the application of symmetry concepts, and then explores the applications of group-theoretic ideas to flow problems. The discussions are predominantly mathematical, and many of the ideas are original. The book is of interest to advanced workers in fluid mechanics, aeronautical design, etc. This is a reprint of the title published by the Princeton University Press, 1950.

CAMPBELL, JOHN WILLIAM

An introduction to mechanics. New York Pitman Publishing Corporation 1947 372 p. illus. 24 cm. $4 75 792

Contents: Rectilinear kinematics. Vector quantities. Plane kinematics. Particle dynamics. Centers of mass. Plane statics. Some properties of matter. Miscellaneous topics. Moments of inertia. Plane motion of a rigid body. Flexure and torsion. Kinematics of plane motion of rigid bodies. Further conditions for equilibrium. Flexible chains and cables. The general motion of a rigid body. Gravitation. Lagrange's equations. Appendices: Principles of computation. Elementary calculus. Definite integrals. A useful reduction. The integral. Simpson's rule. Hyperbolic functions. Bracketing Tables. Answers. Index.

Note: A textbook suitable for use in rigorous courses offered to students in engineering colleges. Mathematical methods involving the use of ordinary and vector calculus are explained. Worked examples are incorporated in the text, and there are additional problems for the students to solve. The author is Professor of Mathematics at the University of Alberta.

CLEMENTS, GUY ROGER, AND LEVI THOMAS WILSON

Analytical and applied mechanics. Third edition. New York McGraw Hill Book Company Inc. 1951 463 p. illus. 24 cm. $7.00. 793

Contents: Vectors. Concurrent forces. Coplanar forces—resultant. Coplanar forces—equilibrium. Framed structures and trusses. Forces in space. Cables. Center of gravity. Kinematics. Kinetics of particles. Impulse and momentum. Dynamics of a body. Stress and strain. Beams. Struts and columns. Combined stress. Problems for review. Appendix. Answers to problems. Index.

Note: An introductory text for use in college courses offered to students who are preparing to specialize in mechanical engineering or another division of engineering that requires a sound fundamental knowledge of mechanics. A fairly rigorous exposition of the basic mathematics and physics is combined with numerous worked examples. Though essentially the same as the text of the second edition published in 1943, revisions and additions have been made in numerous places.

COE, CARL JENNESS

Theoretical mechanics a vectorial treatment. New York The Macmillan Company 1938. 555 p. 21 cm. $7.25 794

Contents: Introduction. Rectilinear motion of a particle. Introduction to vectors. Curvilinear motion of a particle. Displacement and motion of a rigid body. Sliding vectors. Statics of particles and of a rigid body. Statics of a flexible cord. Principles of virtual work. Kinetics of particles. Kinetics of a rigid body. General principles of mechanics. Vector calculus. Potential theory. Index.

Note: A textbook for students of mathematics and mathematical physics, presenting an introduction to classical mechanics, mathematical physics, and the postulates on which they rest, and at the same time explaining and applying immediately the basic principles of vector analysis. The book presents sufficient material for an introductory and an advanced course. A year's work in calculus is required mathematical background, and the last three chapters will be more readily understood by the student who has had a first course in differential equations. Selected exercises are offered both in application of the theory and in simple extensions of it. Answers are given to most of the problems.

CORBEN, HERBERT CHARLES, AND PHILIP STEHLE

Classical mechanics New York John Wiley & Sons Inc., 1950 388 p illus. 22 cm. $7.50 795

Contents: Kinematics of particles. The law of motion. Conservative systems with one degree of freedom. Miscellaneous theorems on systems of particles. Lagrange's equations of motion. Applications of Lagrange's equations. Linear vector spaces. Small oscillations of conservative systems. Rigid bodies. Hamiltonian theory. Contact transformations. Contact transformations which simplify the equations of motion. Poisson brackets. Infinitesimal contact transformations. Further development of transformation theory. Miscellaneous generalizations and analogies. Introduction to special relativity theory. The motion of particles in high energy accelerators. Index.

Note: A college textbook of interest to superior and graduate students who are majoring in physics. It presents the knowledge and concepts in classical mechanics which are valid and useful in present-day physics and afford a sound preparation for the understanding of quantum mechanics.

COURANT RICHARD AND K O FRIEDRICHS

Supersonic flow and shock waves New York Interscience Publishers, Inc., 1948 464 p. illus. 24 cm. (Pure and applied mathematics series H Bohr R. Courant and J J Stoker editors) $8.50 796

Contents: Compressible fluids. General equations of flow. Thermodynamic notions. Differential equations for specific types of flow. Appendix—wave motion in shallow water. Mathematical theory of hyperbolic flow equations for functions of two variables. Appendix. One-dimensional flow. Continuous flow. Rarefaction and compression waves—Appendix. Shocks. Interactions. Detonation and deflagration waves. Appendix—wave propagation in elastic plastic material. Isentropic irrotational steady plane flow. Hodograph method. Characteristics and simple waves. Oblique shock fronts. Interactions—shock reflection. Approximate treatments of interactions. Airfoil flow. Remarks about boundary value problems for steady flow. Flow in nozzles and jets. Flow in three dimensions. Steady flow with cylindrical symmetry. Conical flow. Spherical waves. Bibliography. Index of symbols. Subject index.

Note: The authors, professors of mathematics at the Institute for Mathematics and Physics at New York University, have based this volume on a report which they prepared for the Office of Scientific Research and Development in 1944. Intended as an advanced text for mathematicians, engineers and physicists, it presents in mathematical form the principles and theories regarding the behavior of fluids and gases when subjected to extremely high pressures. Particularly important is the detailed development of the theory of nonlinear wave motion. The extensive bibliography is limited to nonrestricted war-time reports and other readily available material.

DRYDEN HUGH L AND OTHERS

Hydrodynamics. By Hugh L. Dryden, Francis D Murnaghan H Bateman. New York Dover Publications, Inc., 1956 634 p illus. 21 cm. $2 75 797

Contents: Part I, The physics of fluids and classical hydrodynamics. General survey of experimental aerodynamics. The hydrodynamics of a perfect fluid. General physical properties of a viscous fluid. Part II, Motion of an incompressible viscous fluid. General analytical theory. Motion in one direction. Viscous fluid in rotation. Motion in two dimensions. Laminar motion in a boundary layer. Motion in three dimensions. Approximate methods of calculating the resistance to motion through a viscous fluid. Part III, Turbulent flow. General theory. The use of the idea of eddy viscosity. Hydraulic flow in channels of various shapes. Part IV, Compressible fluids. Dynamical equations of motion. Discharge of gases. Flow past an irregular boundary or obstacle. Appendix. Additional references. Author index. Subject index.

Note: This book is a reprint without changes in the text of work that was first published in 1932 as Bulletin 84 of the National Research Council. It was a report of the Council's Committee on Hydrodynamics. It is a cyclopedic survey of the field as of about 1930. The extensive literature references in the text itself and in the appendix of additional references constitute a comprehensive bibliography of the subject to approximately 1931.

THE NATIONAL COUNCIL OF TEACHERS OF MATHEMATICS

Twentieth yearbook The metric system of weights and measures Compiled by the Committee on the Metric System Washington, D C National Council of Teachers of Mathematics, 1948 303 p illus 24 cm. $3 00 786

Contents (abridged) System in measures The metric system—what it is and why we need it, by C. J Arnold. Weights and measures through the ages, by J O. Monasterio Is all this really necessary? by C. Pollock. The early history of the metric system, by E. W Schreiber Later trends in metric usage, by J J Urbancek. The system at work The metric system in chemistry by H. W Baker The metric system in meteorology by C. F Brooks. The metric system in electrical engineering, by A. E. Kennelly The metric system in mechanical engineering, by L. Elliott. The metric system in automotive engineering. The metric system in metalworking, by T H. Miller The international system in research and development engineering, by A. B Smith. The metric system in merchandising, by H. I. Kleinhans. The metric system in medicine, by A. Smith. Metric and avoirdupois in the drug industry by E. V Smith. The metric system from the Pan-American standpoint, by W C. Wells. The metric system and the armed forces, by G. S. Martin, Jr The metric system—an Anglo-American opportunity by H. Allcock. An auxiliary system for the measurement of time, by F J Moles. Decimalization of English measures and computation with approximate data, by C. N Shuster The metric system in science education by P O Johnson. Appendix Relationship between the inch and millimeter by R. E. Hanson. Convenient ways to use equivalent tables.

Note An organized plea for adoption of the metric system of weights and measures in the United States of America. The volume contains original essays and reprints of magazine and newspaper articles by many contributors who describe advantages of the metric system and discuss ways of securing its official adoption.

SMITH, RALPH WEIR

Testing of measuring equipment A manual for weights and measures officials. Issued May 15 1951 Washington, D C. Government Printing Office, 1951 205 p illus 24 cm (United States National Bureau of Standards Handbook 45) $1.25 787

Contents Introduction. Inspection of measuring equipment. Adjustment, rejection and sealing of measuring equipment. Linear measures. Fabric-measuring devices. Taximeters. Odometers. Liquid measures. Graduates. Measure-containers. Milk bottles. Lubricating-oil bottles. Liquid-measuring devices. Grease-measuring devices. Vehicle tanks. Dry measures. Berry baskets and boxes. Water gas, and electricity meters.

Note A manual for state and local weights and measures officials in which various types of commercial measuring equipment, the principles of their operation, and methods for their inspection and test are described. It is devoted primarily to procedures recommended for use by officials when exercising their routine regulatory controls over measuring equipment of all kinds. Testing procedures recommended are in general the minimum requirements considered necessary to enable the official to determine whether or not equipment should be approved for commercial use This handbook is a companion volume to Handbook 37 1945 *Testing of weighing equipment.*

UNITED STATES NATIONAL BUREAU OF STANDARDS

Units of weight and measure (U S customary and metric), definitions and tables of equivalents Issued July 1, 1955 Washington D C. Government Printing Office 1955 64 p 25 cm (United States National Bureau of *Standards* Miscellaneous publication 214) $0 40 788

Contents Introduction. Fundamental equivalents. Definitions of units. Standards of measurement. Spelling and abbreviation of units. Tables of interrelation of units of measurement. Comparison of metric and customary units from 1 to 9. Special tables. Tables of equivalents from 1 to 999 units. Status of international metric system in the United States. Index.

Note In this publication, the units of length, area volume, capacity and mass as used in the United States of America are defined. Tables of interrelations and tables of equivalents for these units in the metric system and in the U S. Customary system are given. There is a section in which the fundamental equivalents are stated, one containing the approved spelling and abbreviation of each of the most common units of weight and measure, and one showing the current status of the metric system in the United States. The conversion tables are confined to simple units, excluding all compound units such as foot-pounds, pounds per cubic foot, and feet per second. This supersedes Miscellaneous publication 121.

ZIMMERMAN, O T, AND IRVIN LAVINE

Industrial Research Service's Conversion factors and tables. Second edition. Dover, N H. Industrial Pesearch Service, Inc., 1955 501 p 16 cm $5 00 789

Contents (abridged) Definitions and fundamental values. Physical constants. Conversion factors—U. S., British, metric. Foreign conversion factors. Foreign monetary equivalents. Conversion tables: mensuration. Temperature conversions. Thermocouple tables. Vapor pressure of water Hydrometer conversions. A.P.I. gravity factors. Viscosity conversions. Color scale conversions. Hardness conversions. Wire and sheet metal gages. Decimal equivalents. Five-place common logarithms. Index.

Note In technical libraries, scientific laboratories and on the desks of scientists and engineers, the first edition of this little book proved to be one of the most useful reference books of our times. In this second edition, the main section has been expanded, and the factors recalculated, so as to take into account new standards and new values for the pertinent physical constants. A new section of conversion factors for units used in foreign countries (other than Great Britain) has been added. This section is arranged by country and is 119 pages long. The section on foreign monetary equivalents is also new and there are a number of less prominent though equally useful additions.

MECHANICS

BECKER, ROBERT A

Introduction to theoretical mechanics New York McGraw Hill Book Company, Inc., 1954 420 p illus 24 cm $8 00 790

Contents: Fundamental principles. Statics of a particle. Statics of rigid bodies. Statics of the suspended string or cable. Work and the stability of equilibrium. Motion of a particle in a uniform field. Oscillatory motion of a particle in one dimension. Motion of systems of particles. Motion of a rigid body in a plane. Motion of a particle under the action of a central force. Accelerated reference systems and constrained motion of a particle. Motion of a rigid body in three dimensions. Generalized coordinates. Vibrating systems and normal coordinates. Vibrating strings and wave motion. Appendixes Area and volume elements in common coordinate systems. Elements of ordinary differential equations Note on hyperbolic functions. Commonly employed expressions involving partial derivatives. Note on Fourier series. Problems. Index.

Note. An advanced undergraduate- and graduate-level textbook developed in a course given by the author at the University of Illinois and designed for students who are preparing for careers in areas of science or engineering where a sound grasp of mechanics is essential. The subject matter is primarily classical Newtonian mechanics however the treatment has a definitely modern flavor In both the expository text and problems, there is emphasis on theory and methods useful in modern science and technology The final three chapters constitute an introduction to the use of coordinate methods in the study of motion.

BIRKHOFF, GARRETT

Hydrodynamics a study in logic, fact and similitude. Published with the Taft Fund of the *University of Cincinnati* New York Dover Publications, 1955 186 p illus 22 cm $1.85 791

Contents: Hydrodynamical paradoxes. Recent progress in free boundary theory. Modeling and dimensional analysis. Group theory and fluid mechanics. Virtual mass and groups. Bibliography. Index.

Note: An unusual book in which the author examines a number of noted paradoxes in fluid mechanics; shows "plausible reasoning" is not applicable in many hydrodynamic situations; discusses theory and practice in the use of models and the application of symmetry concepts; and then explores the applications of group-theoretic ideas to flow problems. The discussions are predominantly mathematical, and many of the ideas are original. The book is of interest to advanced workers in fluid mechanics, aeronautical design, etc. This is [illegible] reprint of the title published by the Princeton University Press, 1950.

CAMPBELL, JOHN WILLIAM

An introduction to mechanics. New York Pitman Publishing Corporation, 1947 372 p illus. 24 cm. $4 75 792

Contents: Rectilinear kinematics. Vector quantities. Plane kinematics. Particle dynamics. Centers of mass. Plane statics. Some properties of matter. Miscellaneous topics. Moments of inertia. Plane motion of [illegible] rigid body. Flexure and torsion. Kinematics of plane motion of rigid bodies. Further conditions for equilibrium. Flexible chains and cables. The general motion of [illegible] rigid body. Gyroscopes. Lagrange's equations. Appendices: Principles of computation. Elementary calculus. Definite integrals. A useful reduction integral. Simpson's rule. Hyperbolic functions. Reading Tables. Answers. Index.

Note: A textbook suitable for use in elementary courses offered to students in engineering colleges. Mathematical methods involving the use of ordinary and vector calculus are explained. Worked examples are incorporated in the text, and there are additional problems for students to solve. The author [illegible] Professor of Mathematics at the University of Alberta.

CLEMENTS GUY ROGER, AND LEVI THOMAS WILSON

Analytical and applied mechanics. Third edition. New York McGraw Hill Book Company Inc., 1951 463 p illus. 24 cm. $7.00 793

Contents: Vectors. Concurrent forces. Coplanar forces—resultant. Coplanar forces—equilibrium. Framed structures and trusses. Forces in space. Cables. Center of gravity. Kinematics. Kinetics of [illegible] particle. Impulse and momentum. Dynamics of [illegible] body. Stress and strain. Beams. Shafts and columns. Combined stress. Problems for review. Appendix. Answers to problems. Index.

Note: An introductory text for use in college courses offered to students who are preparing to specialize in mechanical engineering or another branch of engineering that requires [illegible] sound fundamental knowledge of mechanics. A fairly rigorous exposition of the basic mathematics and physics is combined with numerous worked examples. Though essentially the same as the text of the second edition published in 1943, revisions and additions have been made in numerous places.

COE CARL JENNESS

Theoretical mechanics a vectorial treatment. New York The Macmillan Company 1938 555 p. 21 cm. $7.25 794

Contents: Introduction. Rectilinear motion of [illegible] particle. Introduction to vectors. Curvilinear motion of [illegible] particle. Displacements and motion of [illegible] rigid body. Sliding vectors. Statics of particles and of [illegible] rigid body. Statics of [illegible] flexible cord. Principles of virtual work. Kinetics of particles. Kinetics of [illegible] rigid body. General principles of mechanics. Vector calculus. Potential theory. Index.

Note: A textbook for students of mathematics and mathematical physics, presenting an introduction to classical mechanics, mathematical physics, and the [illegible] to which they lead, and at the same time explaining and applying [illegible] the basic principles of vector analysis. The book presents sufficient material for an introductory and an advanced course. A [illegible] work in calculus is [illegible] required mathematical background, and the last three chapters will be more readily mastered by the student who has had [illegible] first course in differential equations. Selected exercises are offered both in application of the theory and in simple extensions of [illegible] Answers are given to most of the problems.

CORBEN HERBERT CHARLES AND PHILIP STEHLE

Classical mechanics New York John Wiley & Sons Inc., 1950 388 p. illus. 22 cm. $7.50 795

Content: Kinematics of particles. The laws of motion. Conservative systems with one degree of freedom. More general theorems on systems of particles. Lagrange equations of motion. Applications of Lagrange equations. Linear vector spaces. Small oscillations of conservative systems. Rigid bodies. Hamiltonian theory. Contact transformations. Contact transformations which simplify the equations of motion. Poisson brackets. Infinitesimal contact transformations. Further developments of transformation theory. More advanced generalizations and analogies. Introduction to special relativity theory. The motion of particles in high energy accelerators. Index.

Note: A college textbook of interest to upperclass and graduate students who are majoring in physics. It presents the knowledge and concepts in classical mechanics which are vital and useful in present-day physics and afford [illegible] sound preparation for the understanding of quantum mechanics.

COURANT RICHARD AND K O FRIEDRICHS

Supersonic flow and shock waves. New York Interscience Publishers Inc., 1948 464 p illus. 24 cm. (Pure and applied mathematics series H. Bohr R. Courant and J J Stoker editors) $8.50 796

Contents: Compressible fluids: General equations of flow. Thermodynamic notions. Differential equations for specific types of flow. Appendix—wave motion in shallow water. Mathematical theory of hyperbolic flow equations for functions of two variables. Appendix. One-dimensional flow: Continuous flow. Rarefaction and compression waves—Appendix. Shocks. Interactions. Detonation and deflagration waves. Appendix—wave propagation in elastic-plastic material. Isentropic irrotational steady plane flow. Hodograph method. Characteristics and simple waves. Oblique shock fronts. Interactions—shock reflection. Approximate treatments [illegible] interactions. Airfoil flow. Remarks about boundary value problems for steady flow. Flow in nozzles and jets. Flow in three dimensions. Steady flow with cylindrical symmetry. Conical flow. Spherical waves. Bibliography. Index of symbols. Subject index.

Note: The authors, professors of mathematics at the Institute for Mathematics and Physics at New York University, have based this volume on [illegible] report which they prepared for the Office of Scientific Research and Development in 1944. Intended as an advanced text for mathematicians, engineers and physicists, it presents in mathematical form the principles and theories regarding the behavior of fluids and gases when subjected to extremely high pressures. Particularly important is the detailed development of the theory of nonlinear wave motion. The extensive bibliography is limited to unrestricted war-time reports and other readily available material.

DRYDEN HUGH L., AND OTHERS

Hydrodynamics. By Hugh L. Dryden Francis D Murnaghan, H Bateman. New York Dover Publications, Inc., 1956. 634 p. illus. 21 cm. $2 75 797

Contents: Part I. The physics of fluids and classical hydrodynamics. General survey of experimental aerodynamics. The hydrodynamics of [illegible] perfect fluid. General physical properties of a viscous fluid. Part II. Motion of an incompressible viscous fluid. General analytical theory. Motion in one direction. Viscous fluid in rotation. Motion in two dimensions. Laminar motion in [illegible] boundary layer. Motion in three dimensions. Approximate methods of calculating the resistance to motion through [illegible] viscous fluid. Part III. Turbulent flow. General theory. The use of the idea of eddy viscosity. Hydraulic flow in channels of various shapes. Part IV. Compressible fluids: Dynamical equations of motion. Discharge of gases. Flow past an irregular boundary or obstacle. Appendix. Additional references. Author index. Subject index.

Note: This book is [illegible] reprint without changes in the text of [illegible] work that was first published in 1932 as Bulletin 84 of the National Research Council. It was [illegible] report of the Council Committee on Hydrodynamics. It is [illegible] encyclopedic survey of the field as of circa 1930. The extensive literature references in the text itself and in the appendix of additional references constitute [illegible] comprehensive bibliography of the subject to approximately 1931.

Authors of the cited literature are indexed in the author index. The page size of the original report has been reduced in this reprint but the text is still legible.

GIRVIN, HARVEY FRANK

A historical appraisal of mechanics Scranton International Textbook Company, 1948 275 p illus 23 cm $4 75 798

Contents Foreword, by A. A. Potter Part I, The creation of science and scientific thinking: Introduction. Early Greek philosophy Medieval period, 500–1500. Part II, Scientific thought begins to function: The Renaissance, 1400–1600. The beginning of the modern period. Dynamics, the science of motion. Period between Galileo and Newton Isaac Newton, 1642 1727 Work of Newton's contemporaries and followers. In retrospect. Part III, Mechanics of materials Pre-elastic development. Theory of elasticity Post Saint Venant period. Mechanics and engineering education in the United States. The nineteen-forties. Appendices. Index.

Note An easy-to-read account of the gradual development of man s knowledge of physical mechanics. It is intended to provide students and interested laymen with a critical survey and considerable part of the story is told in the form of résumés of the contributions of noted men. Because titles, dates and places of publication are cited for both periodical articles and books in which important advances were revealed, the work has considerable utility as reference book.

GOLDSTEIN, HERBERT

Classical mechanics. Reading, Mass. Addison Wesley Publishing Company, Inc., 1950 399 p illus 24 cm $8 50 799

Contents Survey of the elementary principles. Variational principles and Lagrange's equations. The two-body central force problem. The kinematics of rigid body motion. The rigid body equations of motion. Special relativity in classical mechanics. The Hamilton equations of motion. Canonical transformations. Hamilton-Jacobi theory Small oscillations. Introduction to the Lagrangian and Hamiltonian formulations for continuous systems and fields. Bibliography Index of symbols. Index.

Note A presentation f classical mechanics for graduate students in physics. Instead of following the traditional pattern for this science the author has selected those topics which are of greatest pertinence to modern physics. A further restriction is that such topics as elasticity which have already been thoroughly treated from the modern viewpoint in other books are not covered. The treatment assumes that the reader will have had courses in advanced calculus and analysis. The more difficult mathematical techniques such as matrix algebra are presented in the book itself.

INGLIS, DAVID RITTENHOUSE

Dynamic principles of mechanics New York McGraw Hill Book Company Inc. 1949 174 p illus 24 cm $4 50 800

Contents Kinematics of particle Dynamics of a particle. Coupled oscillators and normal coordinates. Inverse-square force and planetary motion. A dynamical system f several particles. Statics. Rotation of rigid body Impact. Index.

Note A well-organized presentation intended for course use by advanced undergraduates and also by graduates who did not have a specialized course in dynamics as undergraduates. Previous courses in general physics and in calculus are assumed. It is designed as preparation for professional work in modern physics and chemistry consequently although the subject matter is all from classical physics, the treatment is such that the student is prepared, in habits of thinking at least, for the study of quantum mechanics. The uthor is associate Professor of Physics at Johns Hopkins University

LINDSAY ROBERT BRUCE

Physical mechanics an intermediate text for students of the physical sciences. Second edition Princeton D Van Nostrand Company, Inc. 1951 451 p illus 22 cm (University physics series Walter C Michels consulting editor) $6 25 801

Contents The elemental concepts f mechanics. Rectilinear motion of particle. Curvilinear motion in plane Energy in particle dynamics. Statics of particle. Motion of system of particles. Mechanics of rigid body Constrained motion. Oscillations. Deformable bodies and wave motion. Mechanics of fluids. Advanced mechanics. Index.

Note A substantial presentation of classical mechanics. Its primary use is as a textbook in courses offered to college students who are preparing for careers in physics and who hav completed thorough courses in elementary physics and mathematics through calculus and introductory differential equations. The treatment is analytical, and considerable part of the exposition is expressed in mathematics. The first edition was published in 1933 In this edition discussions of several important topics hav been reorganized and rewritten, and new chapter designed to give the student some idea of the scope of advanced mechanics has been added.

SLATER, JOHN CLARKE, AND NATHANIEL H. FRANK

Mechanics New York McGraw Hill Book Company, Inc., 1947 297 p illus 23 cm. (International series in pure and applied physics, G P Harnwell, consulting editor) $5 00 802

Contents The linear motion of particle. The linear oscillator Motion in two and three dimensions. Lagrange's and Hamilton's equations. The motion of rigid bodies. The motion of symmetrical rigid body Coupled systems and normal coordinates. The vibrating string. Wave propagation in the string. The string with variable tension and density The vibrating membrane. Stresses, strains, and vibrations of an elastic solid. Flow of fluids. Appendices. Suggested references. Index.

Note A fuller and more rounded treatment of mechanics than was included in the authors' *Introduction to theoretical physics*, 1933 As in the original volume, emphasis is placed on the theoretical aspects of the subject, and the book is intended for use in rigorous courses in college physics. The general arrangement and form of presentation are similar to the chapters on mechanics in the 1933 work but such topics as linear motion and motion of rigid bodies are discussed in greater detail. In the appendix the mathematical background necessary for an understanding of the subjects discussed is summarized and reviewed.

STEPHENSON, REGINALD JOSEPH

Mechanics and properties of matter New York John Wiley & Sons, Inc. 1952 371 p illus 24 cm. $6 00 803

Contents Kinematics. Force and motion of particles. Work and energy of particles. Newton's law of gravitation and some of its consequences. Free and forced harmonic oscillations. Translational and rotational motion of rigid bodies. Elasticity Statics. Hydrostatics and hydrodynamics. Wave motion. Problems. Index.

Note. An intermediate-level textbook intended for college students who are majoring in physics or in engineering. More advanced aspects of mechanics are considered, and the treatment of them is more rigorous than in lementary texts. On the other hand, the author has taken special pains to mak the techniques and concepts clear Usually word explanation precedes the mathematical expression, and the expository material includes many fully worked examples.

STOKER, JAMES JOHN

Nonlinear vibrations in mechanical and electrical systems New York Interscience Publishers Inc., 1950 273 p 24 cm (Pure and applied mathematics Volume 2) $6 75 804

Contents (abridged) Linear vibrations. Free ibrations of undamped systems with nonlinear restoring forces. Free oscillations with damping and the geometry of integral curves. Forced oscillations of systems with nonlinear restoring force Self-sustained oscillations. Hill equation and its application to the study of the stability of nonlinear oscillation Appendices Mathematical justification of the perturbation method. Bibliography Index

Note Essentially this book is digest of the work done on linear vibrations from about the end of the 19th century when

the fundamental contributions of [illegible] [illegible] were published, to about the end of 1930, together with selections from the significant work since that year. Applications of the mathematical techniques are indicated constantly; thus the book is of interest both to physicists and engineers who have sufficient knowledge of mathematics to follow the exposition. It is also of interest to graduate students in mathematics and professional mathematicians who may wish to pursue research in the field.

STREETER, VICTOR LYLE

Fluid dynamics. New York McGraw Hill Book Company Inc., 1948. 263 p. illus. 23 cm. (McGraw Hill publications in aeronautical science Jerome C. Hunsaker consulting editor) $6.00. 805

Contents: Fluid flow concepts. Fundamentals of frictionless fluid flow. Theorems and basic flow definitions. Three-dimensional flow examples. Application of complex variables to two-dimensional fluid flow. Two-dimensional flow examples. Blasius theorem—flow around cylinders and airfoils. Schwarz-Christoffel theorem—free streamlines. Vortex motion. Equations for viscous flow. Examples of viscous flow. The boundary layer. Index.

Note: An introduction to the general theory of fluid flow intended primarily for use in graduate courses in fluid mechanics. The treatment centers largely on the development and solution of equations which express the behavior of fluids under varying conditions. It is assumed that the reader has a working knowledge of elementary and differential calculus. More advanced mathematical concepts, such as the theories of complex variables and conformal mapping, are explained in the text as the need arises. The illustrative matter includes many original graphic representations of field nets and patterns.

SYMON KEITH R.

Mechanics. Reading, Mass. Addison-Wesley Publishing Company Inc., 1953 358 p. illus. 23 cm. $8.50 806

Contents: Elements of Newtonian mechanics. Motion of a particle in one dimension. Motion of a particle in two or three dimensions. The motion of a system of particles. Rigid bodies—statics. Gravitation. Moving coordinate systems. Introduction to the mechanics of continuous media. Lagrange's equations. Answers to problems. List of symbols. Index.

Note: The most distinctive feature of this textbook treatment of mechanics is that it is written from the viewpoint of physics rather than of engineering. It is a rigorous and rather detailed treatment designed for advanced undergraduate students who have completed courses in basic physics and elementary calculus. Differential equations and vector analysis are employed in the exposition, but it is not essential that readers have familiarity with them before undertaking this text. The bibliography is a well selected list of books.

SYNGE, JOHN L. AND BYRON A. GRIFFITH

Principles of mechanics Second edition. New York McGraw Hill Book Company Inc., 1949 530 p. illus. 24 cm. $7 75 807

Contents: Part I. Plane mechanics. Foundations of mechanics. Methods of plane statics. Applications in plane statics. Plane kinematics. Methods of plane dynamics. Applications in plane dynamics—motion of a particle—motion of a rigid body and of a system. Plane impulsive motion. *Part II.* Mechanics in space. Products of vectors. Statics in space. Kinematics. Kinetic energy and angular momentum. Methods of dynamics in space. Applications in dynamics in space—motion of a particle—motion of a rigid body. Lagrange's equations. The special theory of relativity. Appendix: The theory of dimensions. Index.

Note: In this work, the author departs considerably from the method of approach and the scope of the conventional introductory text in mechanics. More than average attention is devoted to the philosophical background and the discussion of fundamental laws and mechanics in two dimensions and particles; detailed treatment of mechanics in space. Both parts may be used separately, the first as an elementary text requiring a working knowledge of calculus and analytical geometry, the second as an advanced text based on a more advanced mathematical background. The major changes in the second edition consist of thorough revision of the sections on the motion of a particle in an electromagnetic field, and more detailed discussion of principal axes of inertia, Foucault's pendulum and the gyrocompass.

SOLID STATE PHYSICS

GOMER, ROBERT, AND CYRIL STANLEY SMITH editors

Structure and properties of solid surfaces A conference arranged by the National Research Council Lake Geneva, Wisconsin September 1952 Chicago University of Chicago Press, 1953 491 p illus 22 cm. (The University of Chicago Committee on Publications in the Physical Sciences Walter Bartky and others) $10.00 808

Contents: The use of classical macroscopic concepts in surface-energy problems, by C. Herring. Atomic theory of surface energy by P. P. Ewald and H. Juretschke. The mechanical properties of crystalline metal surfaces, by A. J. Shaler. Wetting of solids as influenced by the polarizability of surface ions, by W. A. Weyl. The study of solid surfaces, by G. P. Thomson. The adhesion of solids, by F. P. Bowden and D. Tabor. Crystal growth and chemical structure, by A. F. Wells. Some remarks on facts and theories of crystal growth, by H. E. Buckley. Epitaxy, by H. Seifert. Physical adsorption of gases on solids, by T. L. Hill. Surface structure from the standpoint of chemisorption and catalysis, by M. Boudart. Physical and chemical adsorption of gases on iron synthetic ammonia catalysts, P. H. Emmett. Chemisorption on solid surfaces, by A. Wheeler. The catalytic action of spinels, by G. M. Schwab and others. Index.

Note: Papers first presented at the conference mentioned in the above title have been published in this volume, together with extensive excerpts from the discussions of the individual papers at the conference. The purpose of the conference was not only to summarize the previous and present recent developments in the understanding of solid surfaces, but also to call attention to the many unsolved problems. Eminent scientists working at the research level in fields where the physics and chemistry of surfaces is important participated in the conference, and, generally speaking, addressed themselves to their colleagues. Both the papers and the discussion are technical. The book can be used as an introduction to the field by persons who have the necessary basic knowledge of physics, or the papers can be used as independent monographs by graduate physicists and chemists. Literature references are given in the form of footnotes. There is no index to the authors of the cited literature but the volume does contain an adequate subject index.

KITTEL, CHARLES

Introduction to solid state physics. Second edition. New York John Wiley & Sons, Inc., 1956 617 p. illus. 23 cm. (Wiley series on the science and technology of materials J. H. Hollomon, advisory editor) $12.00. 809

Contents: The description of crystal structures. Diffraction of X-rays by crystals. Classification of solids—Lattice energy of ionic crystals. Elastic constants of crystals. Lattice vibrations. Thermal properties of solids. Dielectric properties. Ferroelectric crystals. Diamagnetism and paramagnetism. Free electron model of metals. Band theory of solids—Brillouin zones. Application of Brillouin zone theory to metals and alloys. Semiconductor crystals. Semiconductor rectifiers and transistors. Ferromagnetism and antiferromagnetism. Superconductivity. Lattice vacancies, diffusion, and color centers. Excitons, photoconductivity and luminescence. Dislocations. Appendix. Author index. Subject index.

Note: Addressed primarily to advanced students of physics, chemistry and engineering, this book introduces the reader to the modern knowledge of the physics of solids. It is not a comprehensive treatment, but those areas of the field which are named in the chapter titles listed above are covered. The level of treatment assumes previous introductory courses in basic physics and atomic physics. Although mathematics is used in all chapters, the exposition is not primarily mathematical, and certain advanced mathematical topics are included only in the appendix. Literature references are given for all chapters, and in this edition they include some publications as recent as 1954. Although only three years lapsed between the first and second editions, the latter is some 200 pages longer. Numerous topics are explained more fully in the second edition, and topics have been added in several chapters.

National Research Council Division of Physical Sciences Committee on Solids

Imperfections in nearly perfect crystals Symposium held at Pocono Manor, October 12–14 1950 *Editorial committee W Shockley*, J H Hollomon R. Maurer and F Seitz. New York John Wiley & Sons, Inc., 1952 490 p illus 24 cm $10 00 *810*

Contents I, On the nature of imperfections in nearly perfect crystals *Imperfections in nearly perfect crystals—a synthesis*, by F Seitz. On the geometry of dislocations, by W T Read, Jr and W Shockley II, The role of imperfections in deformation Imperfections from transformation and deformation, by C. S. Barrett. Experimental information on slip lines, by W T Read, Jr X-ray diffraction studies of cold work in metals, by B. E. Warren and B L. Averbach. Mechanical strength and creep in metals, by N F Mott. The influence of dislocations and impurities on the damping and the elastic constants of metal single crystals, by J S. Koehler. III, Diffusion and related phenomena Relaxation effects in ionic crystals, by R. G Breckenridge. Studies of alkali halides *by photoelectric methods, by L. Apker and E. Taft. Diffusion* in alloys and the Kirkendall effect, by J Bardeen and C. Herring. Theory of diffusion, by C. Zener IV On the properties and effects of external and internal surfaces of crystals *Surface and interfacial tensions* I single-phase solids, by J C. Fisher and C. G. Dunn. Dislocation models of grain boundaries, by W T Read, Jr and W Shockley Interphase interfaces, by C. S. Smith. Substructures in crystals, by A. Guinier *The properties and effects of grain* boundaries, by B Chalmers. Movement and diffusion phenomena in grain boundaries, by R. Smoluchowski. Author index. Subject index.

Note A valuable addition to the literature of the physics of solids. It contains both the final papers whose titles are given above and excerpts from the discussions at the symposium. The first paper is an authoritative survey of the current status of the knowledge of imperfections in crystals. The other papers, for the most part, describe results of recent investigations. In addition to being a fundamental work for specialists in crystallography the *book is of interest to physicists working in the fields of semi*conductors and the physics of metals and to metallurgists conducting fundamental research.

National Research Council Division of Physical Sciences Committee on Solids

Phase transformations in solids Symposium held at Cornell University August 23–26 1948 Editorial committee R. Smoluchowski, *J E Mayer and W A Weyl. New York* John Wiley & Sons Inc., 1951 660 p 22 cm. $12 00 *811*

Contents. On the general theory of phase transitions, by L. Tisza. A general method for imperfect crystals and phase transitions, by J E. Mayer Crystallization as cooperative phenomenon, by J. G. Kirkwood. Fundamental aspects of diffusion in solids, by F Seitz. Nucleation theory by R. Smoluchowski. Crystallographic aspects of phase transformations, by M. J Buerger *The solid-liquid transition* in argon, by O K. Rice. Transitions in silver halides, by M. L. Huggins. Phase transformations in one-component silicate systems, by F C. Kracek. Phase transformations in polycomponent silicate systems, *by J F Schairer Transitions in glass, by W A. Weyl.* Phase transitions in ferroelectrics, by B Matthias. Transformations in pure metals, by C. S. Barrett. Order-disorder transitions in metal alloys, by S. Siegel. Precipitation *from solid solutions of metals*, by A. H. Geisler *The eutectoid reaction, by R. F Mehl and A. Dubé* The martensite transformation, by M. Cohen.

Note The phenomena of phase transformations in solids is of interest in variety of fields, some of which, such as photography and metallurgy are not obviously related. The papers are addressed primarily to scientists working in laboratories and industry They are accompanied by lists of related literature and by transcripts of discussions. Although the book is a valuable contribution to knowledge, no index has been provided.

Photoconductivity Conference

Photoconductivity conference held at Atlantic City, November 4–6, 1954 Editorial committee R. G Breckenridge, B R Russell and E E Hahn Sponsored by University of *Pennsylvania, Radio Corporation of America* and Office of Naval Research. New York John Wiley & Sons Inc., 1956 *653* p illus. *23 cm. $13 50* 812

Contents Part I, Phenomenological theory of photoconductivity *Performance of photoconductors*, by A. Rose. The relation between lifetime, limit of sensitivity and information rate in photoconductors, by R. L. Petritz. Part II, Photon absorption process: Theoretical ideas pertaining to traps or centers, by C. Herring. The influence of lattice vibrations on electronic transitions in solids, by M. Lax. *Indirect transitions from the valence to the conduction* bands, by J Bardeen and others. Absorption near the edge in insulators, by D L. Dexter *Infrared absorption and energy-band* structure of germanium and silicon, by H. Y Fan and others. Note on the statistical mechanics of semiconductor crystals with electron-vibration coupling, by H. M. James. Part III, Electron processes: *Electron processes in photoconductors, by E. S. Rittner. The range* of charge carriers in photoconductors, by F Stöckmann. *The role* of chemisorption in *surface trapping*, by P H. Miller, Jr Interfacial photoeffects in germanium at room temperature, by C. G. B. Garrett and W H. Brattain. The photoelectromagnetic effect, by L. Pincherle *The trapping of minority carriers in silicon*, by J. R. Haynes and J A. Hornbeck. Part IV *Photoconducting materials*: Optical and photoconductive properties of silicon and germanium, by E. Burstein and others. Photoconductivity and photovoltaic effect in intermetallic compounds, by H. P R. Frederikse and R. F Blunt. Absorption and photoconductivity in InSb, by T S. Moss. Photoexcitation in ionic crystals, by J A. Krumhansl. The electrical and optical properties of PbS and allied semiconductors, by R. P Chasmar *Photoconductivity of PbS*, by G. W Mahlman and others. Electrical and optical properties of ZnO, by E. Mollwo. Part V Current topics. *Photoeffects in InSb*, by S. W Kurnick and R. N Zitter. Gold-doped germanium, by W C. Dunlap, Jr Impurity photoconduction in germanium, by G. A. Morton and others. Carrier lifetime in tellurium by D Redfield. Superlinear photoconductivity *by R. H. Bube. Fine-spot scanning of PbS films*, by D Dutton. The electrical and optical properties of PbTe films, by H. Levinstein. The chemical and physical properties of *PbS single crystals*, by W W Scanlon and others. Hall effect and resistivity measurements on photoconductive *PbS films under illumination*, by J. F Woods. Author index. Subject index.

Note. Although it lacks the unity of well-planned treatise, this volume results nevertheless as major contribution to solid state physics. The authors of the papers are scientists who are taking prominent part in research (both academic and applied) in solid state physics and, more particularly photoconductivity in the U.S.A. and other countries at the present time. The participants in the conference also participated in the discussions of the individual papers following their presentation, and excerpts from these discussions are included in the published volume. Also included are selected literature references.

Seitz, Frederick

The modern *theory of solids* *New York* McGraw Hill Book Company Inc., 1940 698 p illus 23 cm (International series in physics L. A. DuBridge consulting editor) $10 00 813

Contents Empirical classification of solid types. *The classical* theory of ionic crystals. The specific heats of simple solids. The free-electron theory of metals and semi-conductors. Quantum-mechanical foundation. *Approximate treatment of the many-body* problem. Molecular binding. The band approximation. Approximational methods. The cohesive energy The work function and the surface barrier The excited electronic states of solids. The electronic structure of the five solid types. The dynamics of nuclear motion phase changes. Theory of conductivity The magnetic properties of solids. The optical properties of solids.

Note Presents survey of the theory of the properties of all types of crystalline solids, treating them from common viewpoint. Besides dealing with the theory of metals, the book discusses the properties of salts and other insulators as well, showing the factors which account for differences and similarities of all these materials.

SOLID STATE PHYSICS advances in research and applications. Editors Frederick Seitz and David Turnbull. Volume I. New York Academic Press, Inc., 1955 469 p illus. 23 cm. $10.00. 814

Contents: Methods of the one-electron theory of solids, by J. R. Reitz. Quantitative analysis of the cohesion in metals, by E. P. Wigner. The quantum defect method, by F. S. Ham. The theory of order-disorder transitions in alloys, by T. Muto and Y. Takagi. Valence semiconductors, germanium and silicon, by H. Y. Fan. Electron interaction in metals, by D. Pines. Author index. Subject index.

—— Volume II. New York Academic Press, Inc., 1956 468 p. illus. 24 cm. $10.00. 815

Contents: Nuclear magnetic resonance, by G. E. Pake. Electron paramagnetism and nuclear magnetic resonance in metals, by W. D. Knight. Applications of neutron diffraction to solid state problems, by C. G. Shull and E. O. Wollan. The theory of specific heats and lattice vibrations, by J. de Launay. Displacement of atoms during irradiation, by F. Seitz and J. S. Koehler. Author index. Subject index.

—— Volume III. New York Academic Press, Inc., 1956. 588 p. illus. 23 cm. $12.00. 816

Contents: Group III—Group V compounds, by H. Welker and H. Weiss. The continuum theory of lattice defects, by J. D. Eshelby. Order-disorder phenomena in metals, by L. Guttman. Phase changes, by D. Turnbull. Relations between the concentrations of imperfections in crystalline solids, by F. A. Kröger and H. J. Vink. Ferromagnetic domain theory, by C. Kittel and J. K. Galt. Author index. Subject index.

Note: The physics of solids is an area of science in which the volume of research and accumulated knowledge has expanded tremendously in the last decade. The discovery of the transistor was a principal factor in this expansion, but solid state physics finds applications also in other fields, notably crystallography and metallurgy. This series provides a summary of advances and a guide to the current literature. The pattern is a familiar one: surveys written by experts and tied rather closely to the literature. According to the editors it is planned to published three types of articles: (1) broad elementary surveys for newcomers to the field, (2) more advanced for research workers already at work in it, and (3) specialized articles on new techniques. The volumes published through 1956 contain the reviews whose authors and titles are listed above.

VON HIPPEL, R.
Dielectrics and waves. New York John Wiley & Sons, Inc. 1954 284 p. illus. 29 cm. $16.00 817

Contents (abridged): Macroscopic approach. Complex permittivity and permeability. Polarization and magnetization. Correlations between electric and magnetic phenomena. Electromagnetic waves in unbounded space. Dimensions and units. Description of dielectrics by various sets of parameters. Polarized radiation. Dipole radiation. Fresnel equations. Reflection and refraction of plane waves by loss-free dielectrics. Skin effect. Electromagnetic fields in wave guides. Treatment of field phenomena by equivalent circuits. Representation of dielectrics by lumped circuit equivalents. Molecular approach. Molecular mechanisms of polarization. The Clausius-Mosotti-Lorentz-Lorenz equation. Electronic polarization. The energy level diagram of atoms. Wave functions of molecules and the concept of quantum-mechanical resonance. Bond energies and dipole moments of diatomic molecules. Polyatomic molecules. The band-width of spectral lines. Microwave spectroscopy. Formation and structure of liquids and solids. Piezoelectricity. Ferroelectricity. Ferromagnetism and ferrimagnetism. Conduction and breakdown. Appendix: Problems and illustrative examples. Elements of vector analysis. Values of physical constants. Table of symbols. Reference list of books and summarizing articles. Index.

Note: In scope, this book is a companion volume to *Dielectric materials and applications*, edited by von Hippel. It is characterized by the same broad, fundamental approach, the central theme of which is the study and understanding of dielectrics in terms of atomic and molecular structure and properties. Essentially it is a survey of the current status of the knowledge of dielectric phenomena from this viewpoint. The traditional or classical view is summarized in the first part, and the new view is covered in the much larger second part. The term "dielectrics" is interpreted broadly so as to include not only electrical insulators but all nonmetals and even metals under certain conditions. Graduate physicists, chemists and electrical engineers are the intended audience.

CRYSTALLOGRAPHY

BUCKLEY, HAROLD EUGENE
Crystal growth. New York John Wiley & Sons, Inc., 1951 571 p. illus. 22 cm. $11.00. 818

Contents: Solution and solubility. Solubility and supersolubility. The artificial preparation of crystals. The Curie theory of crystal growth. The so-called velocities of growth. The diffusion theories. Recent theories of crystal growth. Ideal and real crystals. Miscellaneous types of crystallization. Dissolution phenomena. Crystal habit modification by impurities. Relationship of substances during crystallization. Peculiarities of crystal growth. Appendix: Habit modification in crystals as a result of the presence of impurities. Name index. Subject index.

Note: A substantial survey of the current knowledge of the phenomena of crystal formation and of the techniques of growing large crystals in the laboratory. Due attention is paid to the historical development of the field. Reference numbers in the text are keyed to extensive literature citations at the end of each chapter, and the names of the authors of the quoted articles are brought out in the name index. There are 88 plates made principally from photographs of crystals and 140 figures based chiefly on line drawings.

BUERGER, MARTIN JULIAN
Elementary crystallography an introduction to the fundamental geometrical features of crystals. New York John Wiley & Sons, 1956 528 p. illus. 23 cm. $9.50. 819

Contents: The crystalline state and its relation to other states of matter. Repetition theory. The translation periodicity of crystals. The basic rotational symmetries of crystals. Derivation of the crystal classes. Combinations of symmetry operations involving reflections and inversions. The symmetrical plane lattices. The symmetrical space-lattice types. The coordinate systems of crystallography. Crystal forms. Practical determination of point-group symmetry. The algebra of operations. Space groups isogonal with the cyclic point groups. The dihedral space groups. The isometric axial space groups. Space groups containing operations of the second sort. Résumé of space groups and their derivation. Equivalent positions in space groups. The determination of space groups and the utilization of space-group information. Group theory. Group theory applied to point symmetries. Group theory applied to space symmetries. Index.

Note: An introductory but full-scale treatment of crystal symmetry. Early in the book the author points out that there are only 230 possible types of three-dimensional space patterns. Most of the text that follows is concerned with the derivation of these patterns and with their characteristics in crystals. Allied topics, such as piezoelectric properties of crystals, are covered. Information is included on practical techniques of examining and classifying natural crystals, but this phase of the subject is not emphasized. The mathematics used in most of the book is essentially solid geometry. However in the last two chapters the reader is introduced to the mathematical theory of groups, and the importance of this theory to advanced work in crystallography is indicated. The author is Professor of Mineralogy and Crystallography in the Massachusetts Institute of Technology.

BUERGER MARTIN JULIAN
X-ray crystallography an introduction to the investigation of crystals by their diffraction of monochromatic X radiation. New York John Wiley & Sons Inc., 1942 531 p. illus. 26 cm. $9.50. 820

Contents: Introduction. Some geometrical aspects of lattices. The diffraction of X-rays by crystals. Space-group extinctions. The rotating-crystal method, preliminary account. The reciprocal lattice. Geometrical interpretation of Bragg's law. Rotating-crystal photographs and their interpretation. Practical aspects of rotating-

crystal investigations. Oscillating-crystal photographs and their interpretation. An introduction to moving-film methods. A general introduction to the Weissenberg method. The normal-beam Weissenberg method. The equi-inclination Weissenberg method. Moving-film photographs taken with the X-ray beam inclined to the layers of the reciprocal lattice. The Sauter and the Schiebold methods. The de Jong and Bouman method. The geometry of oblique cells and their reciprocals. The experimental determination of the lattice constants of the crystals belonging to the oblique systems. The theory of attaining precision in the determination of lattice constants. The precision determination of the linear and angular lattice constants of single crystals. The theory and interpretation of reciprocal lattice projections.

Note An introduction to the investigation of crystals and their diffraction of monochromatic X-ray radiation. This volume deals exclusively with modern X-ray crystallography. Essential theory, design and operation of apparatus, simple indexing procedures, connections with group theory, precision determination of lattice constants, and related topics are treated in great detail. The book is addressed primarily to those actively engaged in some phase of crystal structure analysis and should be particularly useful to the beginner in the field. A modest background in physics and mathematics is required, the development is extremely detailed, and the text is replete with excellent diagrams and illustrations. Much of the important data is placed in tabular form. Lists of references are given at the end of each chapter.

CADY, WALTER GUYTON

Piezoelectricity, an introduction to the theory and applications of electromechanical phenomena in crystals New York McGraw Hill Book Company, Inc., 1946 806 p illus. 23 cm (International series in pure and applied physics, Lee A DuBridge, consulting editor) $13 00 821

Contents (abridged) Crystallography. Crystal elasticity. Rotated axes and transformation of elastic constants. Vibrations of crystals. Elastic constants of crystals. Dielectric properties of crystals. Principles of piezoelectricity. Special piezoelectric properties of certain crystals. Production and measurement of piezoelectric effects. Alternative formulations of piezoelectric theory. The piezoelectric resonator. The electrical equivalent of the piezo resonator. Properties and technique of quartz. The quartz resonator. Resonators from other crystals, and composite resonators. The piezo oscillator. Rochelle salt—history, general properties, and technique—piezoelectric observations—dielectric observations—interaction theory and dielectric properties—piezoelectric and elastic properties. The domain structure of Rochelle salt. Internal-field theory of Seignette-electric crystals. Pyroelectricity. Piezo-optic, and other optical effects. Piezoelectricity in the light of atomic theory. Ferromagnetism. General bibliography. Author index. Subject index.

Note In spite of the subtitle, this work ranks as a comprehensive treatment. It is written on the level of graduate students in physics and physicists engaged in piezoelectric work in laboratories and industry. As the chapter titles indicate, topics allied to piezoelectricity are also discussed, and the material on crystals includes quartz and all other kinds that are of interest. The techniques of manufacturing oscillators and other devices from crystals are covered but the treatment of them is less full than the treatment of the theoretical and mathematical aspects of the subject. The main bibliography contains 603 numbered entries to which statements and formulas in the text are keyed.

CULLITY, B D

Elements of X ray diffraction Reading, Mass Addison-Wesley Publishing Company Inc. 1956 514 p illus 24 cm. (Addison Wesley metallurgy series, Morris Cohen consulting editor) $10 00 822

Contents Fundamentals. Properties of X-rays. The geometry of crystals. Diffraction—The directions of diffracted beams—The intensities of diffracted beams. Experimental methods. Laue photographs. Powder photographs. Diffractometer measurements. Applications. Orientation of single crystals. The structure of polycrystalline aggregates. The determination of crystal structure. Precise parameter measurements. Phase-diagram determination. Order-disorder transformations. Chemical analysis by diffraction. Chemical analysis by fluorescence. Chemical analysis by absorption. Stress measurement. Suggestions for further study. Appendixes. Answers to selected problems. Index.

Note. An introduction to X-ray diffraction, addressed primarily to advanced college students who are preparing for careers in such fields as chemistry, metallurgy, ceramics and mineralogy. Although fundamentals and techniques are emphasized, considerable space is devoted also to applications. The subject is not pursued beyond concepts that can be expressed in terms of the Bragg law; however, two sections of the appendix are devoted to the reciprocal lattice. In addition to its study in organized classes, the style of the book and the fullness of the exposition make it suitable for use in self-instruction by college graduates who are familiar with basic physics.

DONNAY, J D H, AND WERNER NOWACKI

Crystal data, classification of substances by space groups and their identification from cell dimensions. With the collaboration of Gabrielle Donnay and many assistants New York The Geological Society of America, 1954 719 p illus 25 cm. (Geological Society of America. Memoir 60) $5 00 823

Contents. Part I, Systematic tables—classification of crystalline substances by space groups, by W Nowacki. Introduction. Main table. Tables of statistical data (tables 1 to 6). Abbreviations of names of scientific journals. Literature references. Part II, Determinative tables—identification of crystalline substances from cell dimensions, by J D. H. Donnay. Introduction. Determinative tables. Appendix. Tables of space-group criteria, by J. D. H. Donnay and D Harker (tables 14 to 19). Formula index. Name index. Errata.

Note. The two parts of this important reference book were written independently but they complement one another. In the first part, crystalline substances are classified by space groups in the main table, which is supplemented by six tables in which the data are presented from a statistical standpoint. Part II—480 pages in length—consists of determinative tables and a series of six short tables of space-group criteria. The determinative tables give, for a long range of crystalline substances, the determinative number and other axial elements, chemical name and formula, number of formula units per cell, space-group, structural type, specific gravity, locality where found (in the case of some minerals), literature reference, and occasional critical remarks. Separate bibliographies are included in the two parts. In the case of Part I, the literature is covered to the middle of 1948; for Part II, the coverage is through 1951. Substances are fully indexed, both by chemical formula and chemical or mineralogical name.

EITEL, WILHELM

Thermochemical methods in silicate investigation New Brunswick Rutgers University Press, 1952 132 p illus. 24 cm $5 00 824

Contents: Introduction. Heats of formation and reaction. Calorimeters for the determination of heats of reaction. Thermochemical principles for the problem of reaction affinities. Experimental methods for determining reaction affinities. Examples for the calculation of free energy changes and affinities. The possibility of anomalies at low temperatures; statistical meaning of entropy. Appendixes. Index to compounds. Subject index.

Note Thermochemical concepts combined with the techniques of modern calorimetry constitute a powerful tool in investigations of structure-energy relationships and the determination of crystal structure. This book supplements the rather scanty literature on the subject. It is based largely on work of the Kaiser Wilhelm Institute for Silicate Research with which the author was associated for many years, but the contributions of American workers in the field are included also. Literature references and valuable notes are included at various points in the text. The book is of interest to research workers in such fields as crystallography, petrology and ceramics.

FRY, WILLIAM J, AND OTHERS

Design of crystal vibrating systems for projectors and other applications by William J Fry John M Taylor and Bertha W Henvis Naval Research Laboratory A H van Keuren, Rear Admiral U.S.N Director, Sound Division, H C. Hays Supt. New York

Dover Publications Inc., 1948 162 p. illus. 24 cm. $3.50 825

Contents: Part I, Design curves: Calculation of Resonant frequency Acoustic impedance of backing material combinations. Resonant frequencies of systems with multiple-material backing. Electrical input impedance and transmitting response. Sensitivity and acoustic input impedance. Efficiency and stress. Acoustic input impedance of particular backing material systems. Part II, Theory: Fundamental equations. Electrical input impedance. Acoustic input impedance. Resonant frequency. Sensitivity. Stress. Appendixes: Symbols, definitions, and conventions. Units and tables of constants. Longitudinal and thickness modes. Fundamental equations for thick wave vibrations.

Note: Essentially this volume is a presentation of technical data concerning the characteristics of piezoelectric crystal vibrating systems. It is made up largely of design curves which depict fundamental piezoelectric relations, and which are based on the analyses of a great number of crystal vibrating systems. Instructions for the use of these curves and an explanation of the methods used in their derivation are included. The calculations and the experimental verifications of them were done under the auspices of the Sonar Design Section of the Bureau of Ships, U.S. Navy and the work was published originally by the Department of Commerce in 1941, as P.B. Report 27412.

Heising Raymond Alphonsus editor

Quartz crystals for electrical circuits their design and manufacture. New York D Van Nostrand Company Inc., 1946 563 p. illus. 24 cm. $8 75 826

Contents: Introduction, by R. A. Heising. Quartz crystal applications, by W. P. Mason. Methods for specifying quartz crystal orientation and their determination by optical means, by W. L. Bond. The use of X-rays for determining the orientation of quartz crystals, by W. L. Bond and E. J. Armstrong. Raw quartz, its imperfections and inspection, by G. W. Willard. Use of the etch technique for determining orientation and twinning in quartz crystals, by G. W. Willard. Modes of motion in quartz crystals, the effects of coupling and methods of design, by R. A. Sykes. Theoretical analyses of modes of vibration for isotropic rectangular plates having all surfaces free, by H. J. McSkimin. Principles of mounting quartz plates, by R. A. Sykes. Sawing, grinding and lapping, by W. L. Bond. Adjusting to frequency by G. M. Thurston. Metal electrodes deposited on quartz crystals by the evaporation process, by H. W. Weinhart and H. G. Wehe. Piezoelectric crystals in oscillator circuits, by I. E. Fair. The mounting and fabrication of plated quartz crystal units, by R. M. C. Greenidge. Effects of manufacturing deviations on crystal units for filters, by A. R. d'Heedene. The measurement of the performance index of quartz plates, by C. W. Harrison. The wire mounted crystal unit, by W. F. Dewey and A. E. Brickhard. Low frequency quartz crystal cuts having low temperature coefficients, by W. P. Mason and R. A. Sykes. Index.

Note: The greater part of this book originated as lectures that were prepared to explain the techniques of quartz crystal design and manufacture to engineers and other technical personnel of the Western Electric Company. Here the lectures have been revised and supplemented to make an extensive presentation of both the theoretical and practical aspects. Specific details of production processes, together with illustrations of machines used in manufacturing, are given in several of the chapters.

Klug Harold P and Leroy E. Alexander

X-ray diffraction procedures for polycrystalline and amorphous materials. New York John Wiley & Sons, Inc., 1954 716 p. illus. 24 cm. $16.00. 827

Contents: Elementary crystallography. The production and properties of X-rays. Fundamental principles of X-ray diffraction. Photographic powder techniques. Spectrometric powder technique. The interpretation of powder diffraction data. Qualitative and quantitative analysis of crystalline powders. The precision determination of lattice constants from powder photographs. Crystallite-size determination from line broadening. Further applications of polycrystalline diffraction. Diffraction studies of noncrystalline materials. Small-angle X-ray scattering. Appendix: Layout for diffraction laboratory. The handling and processing of X-ray film. Miscellaneous constants and numerical data. International atomic weights. Mass absorption coefficients of the elements. Quadratic forms for the cubic system. Atomic and ionic scattering factors. Lorentz and polarization factors. Temperature factor tables. Author index. Subject index.

Note: An important treatise and manual. The fundamentals of crystallography X-rays and the phenomena and theory underlying diffraction techniques are covered in the first three chapters. The rest of the book is devoted to techniques selected by the authors as being the most useful at the present time. These are described in detail from the viewpoint of scientists and laboratory technicians who are or will be concerned with their use in academic and industrial laboratories. The mathematics necessary for understanding techniques and interpreting results is included, but the book is not primarily a mathematical treatise. The more than 300 figures include reproductions of many typical diffraction patterns. There are some illustrations of commercially available apparatus, but obviously the authors have not attempted to cover this aspect thoroughly. The chapter entitled, "Spectrometric powder technique," is based on the use of the *Geiger-counter spectrometer*. Although self-contained in the sense that seldom will a reader need to refer to the literature for details of procedure, literature references are numerous. The authors are staff members of the Mellon Institute and are well known as contributors to this field.

Mason Warren Perry

Piezoelectric crystals and their application to ultrasonics New York D Van Nostrand Company Inc. 1950 508 p. illus. 24 cm. (The Bell Telephone Laboratories series) $10.00. 828

Contents. Crystal systems, classes and symmetries. Elastic, piezoelectric, and dielectric relations in crystals. Properties of crystals determinable from small sets. Resonance measurement of the properties of large-sized crystals. Properties and uses of quartz crystals. Properties and uses of rochelle salt. Properties and uses of ammonium dihydrogen phosphate (ADP) and potassium dihydrogen phosphate (KDP). Properties and uses of ethylene diamine tartrate (EDT) and dipotassium tartrate (DKT) crystals. Measurements of the properties of a number of piezoelectric crystals. Theory of ferroelectric crystals. Electrostrictive effect in rochelle salt and barium titanate. Properties of gases and methods for measuring them by crystal transducers. Measurements of the properties of liquids. Properties of solids and their measurement by ultrasonic waves. Appendix. Index.

Note. A technical work addressed to such readers as graduate physicists and communications engineers engaged in research and design. It is one of several fundamental modern works on piezoelectricity all of which complement one another. Although there is some discussion of quartz crystals, there is much more on such crystals as EDT DKT and the others named in the table of contents. The properties of these crystals are fully described from the theoretical standpoint. The last three chapters discuss the investigation of certain properties of gases, liquids, and solids by means of ultrasonic radiation generated by piezoelectric crystals.

Read W T, jr.

Dislocations in crystals. New York Mc Graw Hill Book Company Inc., 1953 228 p. illus. 24 cm. (International series in pure and applied physics Leonard I Schiff consulting editor) $5.00 829

Contents: Why dislocations? Part I, Theory: Some simple examples. Imperfections in crystals. Dislocations in motion. Forces on dislocations. Multiplication and interaction of dislocations. Partial dislocations. The stress around a dislocation. Forces between dislocations. Part II, Applications: Application to crystal growth. Simple grain boundary. General grain boundaries. Measurements of grain boundary energy. The motion of a grain boundary. Appendix. References. Name index. Subject index.

Note: An introductory work written from the metallurgical viewpoint but of interest also to advanced students of physics who are preparing for research in the physics of the solid state. The author states: "There is a general impression that dislocation theory is an open field for the speculations of theoretical physicists. In dislocation metallurgy the different bits of theory appear as a hodgepodge of ingenious but arbitrary creations. I have tried to present the other side of the picture and develop the basic ideas as a coherent body of knowledge. ... The book is written in a concrete style that is easy to grasp, and the verbal discussions are supplemented by a number of numerous drawings. The author is on the staff of Bell Telephone Laboratories, Inc.

UNITED STATES NATIONAL BUREAU OF STANDARDS NATIONAL APPLIED MATHEMATICS LABORATORIES

Tables for conversion of X ray diffraction angles to interplanar spacing Issued September 20 1950 Washington, D C Government Printing Office, 1950 159 p 27 cm (United States National Bureau of Standards Applied mathematics series 10) $2 00 830

Contents. Introduction. Tables of spacing values [θ = 0(.01)90°; 5S] Molybdenum Kα_1 radiation, λ = 0.70926A. Copper Kα_1 radiation, λ = 1.54050A. Nickel Kα_1 radiation, λ = 1.65783A. Cobalt Kα_1 radiation, λ = 1 78890A. Iron Kα_1 radiation, λ = 1 93597A. Chromium Kα_1 radiation, λ = 2.28962A. Tables of spacing values [2θ = 0(.02)180°; 5S]: Copper Kα_1 radiation, λ = 1.54050A. Iron Kα_1 radiation, λ = 1 93597A.

Note These tables give spacing values *d* in angstrom units corresponding to the angles θ which are usually measured when diffraction patterns are used for chemical identification and crystal structure determination. The angles are related to interplanar spacings *d* by the formula $d = \frac{\lambda}{2 \sin \theta}$ where λ is the wavelength of incident X radiation and θ is half the angle between the incident and diffracted rays. The wavelengths used in the calculations are those adopted at the International Conference sponsored by the British Institute of Physics in London, July 1946.

WAHLSTROM, ERNEST EUGENE

Optical crystallography Second edition New York John Wiley & Sons, Inc., 1951 247 p illus. 24 cm. $5 00 831

Content Crystallography Physical properties. Elementary optics. Optics of isotropic substances. The polarizing microscope Measurement of index of refraction. The uniaxial indicatrix. Polarization of light. Uniaxial crystals in plane-polarized light. Uniaxial crystals in convergent polarized light. Optical accessories. Sign determination in uniaxial crystals. Biaxial crystals—the biaxial indicatrix. Biaxial crystals in convergent polarized light. Determination of optic sign in biaxial crystals. Dispersion in biaxial crystals. Microscopic examination of nonopaque substances. Appendixes. Index.

Note. The techniques and principles of optical crystallography are rapidly finding application in fields other than those of mineralogy and petrology This volume is intended to serve as an introduction to the subject for workers in these other fields who are concerned with the identification of solids. Like its predecessor this edition deals primarily with basic principles and theories. Most of the chapters have been rewritten and expanded, and numerous three-dimensional drawings have been added. The section on the universal stage method has been enlarged, and the selective bibliography has been revised and brought up to date.

WYCKOFF, RALPH WALTER GRAYSTONE

Crystal structures Section I New York Interscience Publishers Inc, 1948 504 p illus 26 cm $8 00 832

Content Preface and introduction. Inorganic structures Structures of the elements. Structures of the compounds RX. Structures of the compounds RX_2. Structures of complex binary compounds, R_nX_m. Structures of the compounds $R(MX_2)_n$. Compounds of the type $R_n(MX_3)_p$.

—— Volume II New York Interscience Publishers Inc 1951 585 p illus. 25 cm. $10 00 833

Content Compounds of the type $R_n(MX_4)_p$. Compounds of the type $R_x(MX_m)_y$ The crystal structures of hydrates and ammoniates. The structures of aliphatic compounds.

—— Volume III New York Interscience Publishers, Inc., 1953 v p illus. 25 cm $14 50 834

Contents The structures of aliphatic compounds. The structure of benzene derivatives. The crystal structures of alicyclic and heterocyclic compounds, and of carbohydrates. Illustrations. Bibliography

Note A reference work of considerable importance in crystallography It supersedes the author's *The structure of crystals*, second edition New York, 1931–34 and is designed to serve essentially the same purpose as that work. It provides concise descriptions, tabulated data, diagrams, and literature references on the crystal structures of specific compounds. It is published in loose-leaf format, and is so arranged that it can be kept up to date by the insertion of supplementary matter offered by the publisher from time to time. In 1951 a first supplement, containing additions to Chapters I through X, in the form of 72 text pages and 64 pages of tables, was published; and in 1953 Supplement II, containing 30 text pages and 64 pages of tables representing additions to Chapter XIII, was published. Chapters XI and XII, which will form parts of the third section, or volume and will cover respectively compounds of the type $R_n(MX)_p$ and silicates, are still to be published.

ATOMIC AND NUCLEAR PHYSICS

ANNUAL REVIEW OF NUCLEAR SCIENCE. Volume 6 James G Beckerley, editor, Martin D Kamen, associate editor, and Leonard I. Schiff, associate editor Palo Alto Annual Reviews, Inc. in co-operation with the National Research Council of the National Academy of Sciences, 1956 471 p. illus. 23 cm $7 00 835

Contents Time variations of primary cosmic rays, by V Sarabhai and N W Nerurkar Polarization of fast nucleons, by L. Wolfenstein. Excitation of nuclei by charged particles, by N P Heydenburg and G. M Temmer Isotope shift in atomic spectra, by J E. Mack and H. Arroe. Properties of medium-weight nuclei, by K. Way and others. Generalized acidity in radiochemical separations, by R. A. Horne and others. The masses of light nuclides, by J Mattauch and others. Nuclear radiation effects in solids, by H. Brooks. Applications of oxygen isotopes in chemical studies, by H. Taube. Recent advances in low level counting techniques, by E. C. Anderson and F N Hayes. Nuclear reactors for electric power generation, by L. Davidson and others. Cellular radiobiology by L. H. Gray Vertebrate radiobiology: Embryology by J P O'Brien.

Note. The sixth volume in an annual series, the purpose of which is to survey significant developments in nuclear science. It publishes monographic reviews of areas of the field in which there have been significant recent advances, rather than strict chronological digests of all the literature. It is addressed to graduate scientists and engineers. The sixth volume contains the reviews whose authors and titles are listed in the above contents. The authors have surveyed the literature down to March, 1956, or some other month early in 1956, and have covered the literature of several recent years. Full author and subject indexes are included.

BETHE, HANS A, AND PHILIP MORRISON

Elementary nuclear theory Second edition. New York John Wiley & Sons Inc., 1956 274 p illus 24 cm $6.25 836

Contents Part I, Descriptive theory of nuclei Basic facts about nuclei. The size of nuclei. β-disintegration (descriptive) Further facts on nuclear disintegrations. Spin and statistics. β-disintegration and the neutrino. Mesons and others. Part II, Quantitative theory of nuclear forces. Physical properties of proton neutron, and deuteron. Ground state of the deuteron. Scattering of neutrons by free protons. Effects of molecular binding coherent scattering. Interaction of the deuteron with radiation. Scattering of protons by protons. Non-central forces. Saturation of nuclear forces. Nucleon scattering at high energies. Polarization of nucleons. Sketch of the meson theory of nuclear forces. Part III, Complex nuclei—β-decay The structure of nuclei. Nuclear reactions and scattering β-disintegration. Some numerical relations. Appendix Table of nuclear species. Author index. Subject index.

Note The first edition of this book published in 1947 carried the sub-title A short course on selected topics In its second edition, the book is considerably longer but it is still an introduction to selected topics in nuclear theory rather than a comprehensive treatise. The emphasis is on basic facts about atomic nuclei, nuclear forces, and the complex reactions of heavier nuclei. Most of the

exposition is descriptive and is written in narrative form. Nevertheless, the reader will need to be familiar with the basic concepts of [illegible] physics and matrix algebra. Many topics not mentioned in the first edition are discussed in this one. The useful table of [illegible] nuclear species included in the appendix has been revised and brought down to date.

BEYER, ROBERT T., editor
Foundations of nuclear physics. Facsimiles of thirteen fundamental studies as they were originally reported in the scientific journals. With a bibliography compiled by Robert T. Beyer. New York Dover Publications 1949 272 p. illus. 24 cm. $1.75 837

Contents: Papers: The positive electron, by C. D. Anderson. The existence of a neutron, by J. Chadwick. Experiments with high velocity positive ions: II. The disintegration of elements by high velocity protons, by J. D. Cockcroft and E. T. S. Walton. Un nouveau type de radioactivité, by I. Curie and M. F. Joliot. Possible production of elements of atomic number higher than 92, by E. Fermi. Versuch einer Theorie der β-Strahlen, by E. Fermi. Über die magnetische Ablenkung von Wasserstoffmolekülen und das magnetische Moment des Protons, by R. Frisch and O. Stern. Zur Quantentheorie des Atomkernes, by G. Gamow. Über den Nachweis und das Verhalten der bei der Bestrahlung des Urans mittels Neutronen entstehenden Erdalkalimetalle, by O. Hahn and F. Strassmann. The production of high speed light ions without the use of high voltages, by E. O. Lawrence and M. S. Livingston. The scattering of α and β particles by matter and the structure of the atom, by E. Rutherford. Collision of α particles with light atoms. Part IV. An anomalous effect in nitrogen, by E. Rutherford. On the interaction of elementary particles. I, by H. Yukawa. Bibliography. List of journals.

Note: The first 14[illegible] pages of this book are occupied by the articles, whose authors and titles are listed in the above contents. As stated in the title of the volume, the articles are facsimile reprints from various journals. Following the articles is an original [illegible]-page bibliography classified under 13 such heads as "Isotopes and mass measurements," "Scattering and collision processes," "Radioactivity," "Theory of nuclear structure," and "Mathematics and apparatus." Under each heading, the bibliographical entries are arranged alphabetically by authors' names, and include titles which are translated into English, in case of original publication in other languages. There is no index.

BLACKWOOD, OSWALD H., AND OTHERS
An outline of atomic physics. Third edition. Collaborators on the third edition: Thomas H. Osgood and Arthur E. Ruark. New York John Wiley & Sons, Inc., 1955 501 p. illus. 24 cm. $7.50 838

Contents: The atomic nature of matter. The atomic nature of electricity. The nature of radiant energy. The Bohr model of the atom. X-rays. Waves associated with material particles. Atomic spectra and the Pauli principle. The periodic system. Molecular structure and related topics. Radioactivity. Elementary particles. Transmutation and nuclear structure. Applications of nuclear physics. Cosmic rays. The theory of relativity. Appendices. Index.

Note: An introductory survey of atomic and nuclear structure and radiations, addressed to college students who have completed an introductory college course in basic physics. It was originally developed in a course of lectures at the University of Pittsburgh and, although the book has been much rewritten since the appearance of the first edition in 193[illegible], this origin is still apparent in the vivid, readable style. Mathematics is used, but sparingly, and most of the exposition is conveyed in physical terms. The second edition of the book was published in 19[illegible]. In this third edition, [illegible] has been extensively revised and supplemented so as to bring [illegible] abreast of the great advances in the field in the past two decades.

BLATT, JOHN M., AND VICTOR F. WEISSKOPF
Theoretical nuclear physics. New York John Wiley & Sons, 1952 864 p. illus. 24 cm. $13.50. 839

Contents: General properties of the nucleus. Two-body problems at low energies. Nuclear forces. Two-body problems at high energies. Three- and four-body problems. Nuclear spectroscopy: I. General theory—II. Special models. Nuclear reactions: General theory—Application of the theory to experiments. Formal theory of nuclear reactions. Spontaneous decay of nuclei. Interaction of nuclei with electromagnetic radiation. Beta-decay. Nuclear shell structure. Appendixes. A. Angular momentum operators and eigenfunctions—B. Multipole radiation. References. Index.

Note: Generally speaking, the scope of this book is classical nuclear physics, or nuclear phenomena involving energies of about 50 Mev and below. Thus, cosmic rays and meson phenomena are not covered. Within this limitation the authors present the current theories, theoretical nuclear physics, and the experimental evidence which supports them, together with the pertinent mathematical formulas and manipulations. The book is addressed to graduate students of physics and graduate physicists already engaged in research. Readers need a previous introduction to quantum mechanics.

BLEULER, ERNST, AND GEORGE J. GOLDSMITH
Experimental nucleonics. New York Rinehart & Company, Inc. 1952 393 p. illus. 24 cm. $6.50 840

Contents (abridged): Radiation protection. Laboratory equipment. Preparation of sources. Part I, General techniques: Technique of measurements with Geiger-Müller counters. Routine beta measurements. Absolute beta counting. Neutron activation of silver. The naturally occurring radioactive substances. Measurement of source strength by comparison with [illegible]. Mean life of thermal neutrons in water. Absorption of continuous beta spectra. Absorption of gamma rays. Part II, Chemical techniques: Separation of active material by solvent extraction. The Szilard-Chalmers process with ethyl iodide. Separation by ion exchange. Electrochemical separations. Preparation of carrier free sources. Radioelements as tracers. Separation of nuclear isomers. Preparation of [illegible]. Measurement of C^{14} with an ionization chamber. Part III, Physical techniques: Range and energy loss of alpha particles. Tracks of particles in photographic plates. Scintillation counters. Coincidence measurements. Radiations of [illegible]. Cosmic rays. Appendix. Author index. Subject index.

Note: Primarily a laboratory manual for advanced college students who have acquired a fundamental knowledge of nuclear physics and chemistry. Specific procedures are described for 24 experiments, most of which can be performed with naturally radioactive materials. In each case the procedures are preceded by a thorough discussion of the pattern illustrated by the experiment, together with their applications in nuclear physics and other fields of scientific investigation where radioactive materials are used.

CASE, K. M., AND OTHERS
Introduction to the theory of neutron diffusion. Volume I. By K. M. Case, F. de Hoffmann, and G. Placzek. Numerical work by B. Carlson and M. Goldstein. United States Atomic Energy Commission. Los Alamos Scientific Laboratory, Los Alamos, New Mexico, June 1953. Washington, D. C. Government Printing Office 1954 174 p. illus. 26 cm. $1.25 841

Contents: Part A, Introduction. Definitions. Part B, Propagation in the absence of scattering collisions: 1, Streaming in vacuum. Continuity equation. Source-free streaming. Sources. 2, Purely absorbing medium. Consequences of the continuity equation. Point source. Plane source. Shell source. Remarks on the reciprocity theorem. Escape probabilities. Part C, One-velocity theory of neutron diffusion: 1, Equations for a general medium. The transport equation and some of its properties. Integral equations. 2, Uniform infinite medium with isotropic point source. Isotropic plane source. Anisotropic sources. 3, Application of the results obtained for the uniform infinite medium to the solution of finite problems. Reduction of finite problems to an infinite-medium problem. Standard problems. Appendices.

Note: The mathematical development of the theory of neutron diffusion forms the basis for theoretical work underlying neutron chain reactions. The aim of this monograph is to give a detailed discussion of the general equations of one-velocity neutron diffusion theory and of their solution for the special case of a homogeneous infinite medium with isotropic scattering.

CONFERENCE ON HIGH ENERGY NUCLEAR PHYSICS

High energy nuclear physics, Proceedings of the Sixth annual Rochester Conference, April 3–7, 1956 Compiled and edited by J Ballam and others New York Interscience Publishers, Inc, 1956 360 p 28 cm $3 75 842

Note The only available report of the proceedings of a conference attended by nearly 200 scientists associated with the foremost nuclear physics research centers of the world. It is not a collection of formal papers, similar to the proceedings of many conferences. Instead, the talks, papers and discussions are presented in a condensed, paraphrased version based apparently on reporters' notes. Interest in the volume's contents is due to (1) the reporting of experimental results still unpublished and (2) the discussions by experts of the current state of knowledge and theory in rapidly advancing areas of nuclear research. The volume has a table of contents but no index.

CORK, JAMES MURLE

Radioactivity and nuclear physics Second edition Princeton D Van Nostrand Company Inc., 1950 415 p. illus. 22 cm. 843

Contents Natural radioactivity The detection of radiation. Induced radioactivity-apparatus. Alpha rays. Beta rays. Gamma radiation. Neutrons. Protons, deuterons, and tritions. Mesons (mesotrons) Cosmic radiation Nuclear fission. Some applications of radioactivity Health physics. Table of isotopes. References. Appendix: Fundamental constants. Useful information concerning electrons. Data on electrons. Useful information regarding protons in motion. Useful information regarding alpha particles. Excitation potentials for the elements, in kilovolts. Author index. Subject index.

Note. An introductory work designed primarily as a text for college students, but so organized and written that it is useful also to persons outside of college who have a moderate amount of technical education and are in need of a fairly substantial survey Under each heading the historical background is sketched briefly then the current knowledge is summarized, together with formulas and data. The third edition was published in 1957 415 p., $7 75.

DUSHMAN, SAUL

Fundamentals of atomic physics. New York McGraw Hill Book Company, Inc., 1951 294 p illus 24 cm $6 00 844

Contents A brief history of physics. Mathematical introduction Kinetic theory of gases Molecular velocities. Kinetic theory of gases: Mean free path and molecular diameter Charge and mass of electron Electronics. Photoelectric effect. X-rays. Bohr theory of the origin of spectral lines. Electron configurations in atoms and the periodic arrangement of the elements. Matter waves. Isotopes. Nuclear phenomena. Generators for acceleration of high-energy particles. Appendixes. Index.

Note A book developed from material originally prepared to be used in short courses offered to high-school teachers of science under a program sponsored by the General Electric Company The treatment is compact, and a good deal of ground is covered The reader needs a knowledge of basic physics and of elementary calculus, but aside from these requirements the book is not difficult to comprehend. It is suitable not only for teachers but also for such readers as engineers who want a fairly solid book for personal reading.

EVANS ROBLEY D

The atomic nucleus New York McGraw Hill Book Company Inc, 1955 972 p illus 24 cm (International series in pure and applied physics Leonard I Schiff consulting editor) $14 50 845

Contents Charge of atomic nuclei. Radius of nuclei Mass of nuclei and of neutral atoms. *Nuclear moments, parity and statistics* Atomic and molecular effects of nuclear moments, parity and statistics. Effects of nuclear moments and parity on nuclear transitions. Isotopic abundance ratios. *Systematics of stable nuclei.* Binding energy of nuclei. Forces between nucleons. Models of nuclei. Conservation laws for nuclear reactions. Nuclear reactions, illustrated by B^{10} (α,p) and its associates. Energy dependence of nuclear reaction cross sections. *Radioactive-series decay* α-ray spectra. β-ray spectra. Ionization of matter by charged particles. Elastic scattering of electrons and positrons. Radiative collisions of electrons with atomic nuclei. Stopping of electrons by thick absorbers. *Passage of heavy charged particles through matter* The interaction of electromagnetic radiations with matter—Compton scattering and absorption. *Photoelectric effect and pair production.* Attenuation and absorption of electromagnetic radiation. Statistical fluctuations in nuclear processes. *Statistical tests for goodness of fit.* Applications of Poisson statistics to some instruments used in nuclear physics. Appendixes. *Bibliography* Glossary of principal symbols. Index.

Note A textbook developed at the Massachusetts Institute of Technology in courses offered to senior undergraduate and first-year graduate students. *It covers the basic experimental evidence and the fundamental theory of present-day nuclear physics.* It is based on an extensive literature survey and—an unusual feature for a college text—contains keyed *references from important statements* and data to the 33-page bibliography The variety and wide range of reference information make it useful as a *desk reference book* for some graduate physicists. The seven appendixes are devoted to a variety of topics, including a discussion of Thomson scattering as an illustration of wave and corpuscular concepts of cross sections

FEENBERG, EUGENE

Shell theory of the nucleus. Princeton Princeton University Press, 1955 211 p illus. 26 cm. (Investigations in physics, edited by Eugene Wigner and Robert Hofstadter) $4 00 846

Contents. The magic numbers. Single particle models. Magnetic dipole and electric quadrupole moments. Isomeric transitions. Survey of beta transitions—mostly odd *A* Survey of beta transitions—even *A* Analysis of superallowed transitions. *jj coupling matrix elements* The spheroidal core, collective motions, and shell structure. Nuclear force models and shell structure. Appendixes. Subject index. Name index.

Note: A compact statement of the current status of the concept of shell models of the atomic nucleus in general and of the spin-orbit level model in particular *It is written from the standpoint of the usefulness of this particular model in the interpretation of observed results. However the author's viewpoint is a critical one* and the model is not presented as the final representation of nuclear structure. The *historical development of the shell theory is well* outlined in the first chapter Literature references, rather inconveniently arranged, are included for each chapter The book contains many tabulations of a reference nature

FERMI, ENRICO

Elementary particles. New Haven Yale University Press 1951 110 p. 23 cm $3.00 847

Contents Quanta of a field as particles. Interaction of the fields. *The interaction constants. Pions, nucleons, and anti-nucleons.* Appendices Quantization of the radiation field. Second quantization with Pauli principle. Measurability of the fields. Relativistic invariance. Relationships between interaction constants.

Note This book is in effect a survey of current thought pertaining to the component particles of the atomic nucleus and to their interactions. Although it is based on the Silliman Memorial Lectures delivered by the author at *Yale University in April, 1950,* it is not addressed to the general public. Instead, the intended audience includes graduate students of physics and graduate physicists who are not specialists in nuclear physics but who desire some acquaintance with current concepts.

FINKELNBURG, WOLFGANG

Atomic physics translated from the revised German edition in cooperation with the author by George E Brown New York Mc Graw Hill Book Company Inc. 1950 498 p illus. 23 cm. (International series in pure and applied physics G P Harnwell, consulting editor) $8 00 848

Contents (abridged) Introduction. Atoms, ions, electrons, atomic nuclei, photons. *Atomic spectra and atomic structure.* The atomic

theory according to quantum mechanics. Nuclear physics. Molecular physics. Atomic physics of the liquid and solid state. Appendix: The most important constants and energy relations of atomic physics. Index.

Note: A comprehensive treatment of atomic and molecular physics designed for upperclass undergraduate college students majoring in physics and for graduate students. The chapters are supplemented by well-selected and rather extensive lists of references. The first edition of the book was written in German and published in Germany in 1948. The present edition has been translated from the manuscript of the revised German edition before the publication of the latter.

Note: A rather full and satisfactory presentation written in the terms of logical positivism or operational physics. The author has given particular attention to indicating the experimental bases of theories. Landmark experiments are specifically described and, in many cases, diagrams of experimental set-ups. The reader needs facility in algebraic computation, even though the presentation is more physical than mathematical. The book is designed for upperclass undergraduates and beginning graduate students who have studied general physics. The first edition was published in 1930. The book is shorter in this second edition, but the reduction in length has been achieved by eliminating material of marginal interest. A considerable mass of information and revised data has been added, and the book has been reorganized.

GLASSTONE, SAMUEL

Sourcebook on atomic energy. Princeton: D. Van Nostrand Company, Inc., 1950. 546 p. illus. 24 cm. 849

Contents: Foundations of the atomic theory. Constituents of the atom. Energy and radiation. The structure of the atom. Natural radioactivity. Measurement of radioactivity. Nuclear radiations. Isotopes. The acceleration of charged particles. Nuclear transmutation and artificial radioactivity. The neutron. Nuclear structure and nuclear forces. Nuclear fission. The utilization of nuclear energy. The new elements. The uses of isotopes. Cosmic rays and mesons. Radiation protection and health physics. Name index. Subject index.

Note: This book is not a popularization in the usual sense of the term, but is instead a reliable presentation in terms that such nonspecialist readers as journalists, teachers, and industrial executives can understand. In each chapter the historical development of the particular facts under discussion is outlined; then a factual, reasonably detailed account of the current state of the subject is given. The names of scientists who have contributed to the development of atomic energy and the knowledge of the atom are mentioned frequently and are brought together in the author index, but there is no formal bibliography. A second edition was published early in 1958, 640 p., $4.40.

HARNWELL, GAYLORD P., AND WILLIAM E. STEPHENS

Atomic physics: an atomic description of physical phenomena. New York: McGraw-Hill Book Company, Inc., 1955. 401 p. illus. 24 cm. (International series in pure and applied physics, Leonard I. Schiff, consulting editor) $8.00 852

Contents: Classical foundations of atomic theory. Atomic nature of matter and radiation. Atomic structure. Electron spin and polyelectronic atoms. Molecular structure. Statistics of atomic processes. Elementary properties of matter. Relationships between units. Principal atomic constants. Index.

Note: Designed as a text for use in first year graduate courses, the book is a well-organized and broad introduction to the basic knowledge of atomic physics. The first chapter is a concise résumé of background concepts and laws from classical physics. This material is used as a logical introduction to the birth and development of atomic physics. Throughout the book, relationships between classical physics and atomic physics are pointed out where they exist. The chapter on statistics is organized on this pattern. It deals first with classical statistics, then introduces the reader to quantum statistics. Mathematics is used freely in the exposition, but the book can be fairly described as a descriptive rather than a mathematical treatment.

GREEN, ALEX E. S.

Nuclear physics. New York: McGraw-Hill Book Company, Inc., 1955. 535 p. illus. 24 cm. (International series in pure and applied physics, Leonard I. Schiff, consulting editor) $9.00 850

Contents: Relativistic dynamics and review of atomic physics. Static properties of nuclei. Accelerators. Precision instruments and methods. Detectors and nuclear techniques. Radioactivity. Nuclear reactions. Systematics and tendencies of nuclei. Liquid-drop model and fission. Quantum mechanics and the nucleus. Nuclear periodic table. Nuclear decay. Theory of nuclear reactions. Nuclear forces. Appendixes: Some useful constants and conversion factors. Beta-stable nuclides: their mass decrements (in mMU) and mass differences between adjacent isobars (in mMU). Index.

Note: A well-organized, introductory account of accumulated knowledge, experimental techniques and current hypotheses pertaining to the behavior and structure of atomic nuclei. It is designed for use as a college text by advanced students of physics. Selected parts of it, particularly the chapters on accelerators, instruments and techniques, are potentially useful as background information for graduate scientists working in other fields who need a working acquaintance with nuclear instruments, etc. In the final chapter the reader is given a [illegible] view of the current state of theory pertaining to nuclear forces and is told that formulation of a satisfactory theory remains as a challenge to scientists working in the field. Each chapter contains an extensive list of literature references.

HOAG, J. BARTON

Electron and nuclear physics. Third edition, revised by S. A. Korff. Princeton: D. Van Nostrand Company, Inc., 1948. 522 p. illus. 22 cm. $6.00 853

Contents: Electron physics. The charge of the electron. The mass of the electron. The wave-length of the electron. Photoelectric emission. Thermionic emission. High-vacuum, low-voltage tubes. The outer part of the atom. The passage of electricity through gases. X-rays. Nuclear physics. Positive rays and isotopes. Spontaneous disintegration. Alpha, beta and gamma rays. The acceleration of ions. Artificial transmutation. Cosmic rays. Laboratory technique. Vacuum technique. Small current technique. The detection of particles. Notes on high voltage technique. Problems. Tables. Index.

Note: This book has two main purposes: first, to give concise accounts of experiments which have established or confirmed currently accepted facts and theories in electron and nuclear physics; second, to give instructions for performing similar experiments in the college laboratory. It is designed chiefly for senior college and graduate students of physics, but it has also considerable historical and reference value for persons trained in physics. The scope and arrangement of material remain the same as in the previous edition (1938) but considerable material has been added to cover later developments. The chapters on artificial transmutation and cosmic rays show the greatest revision, but other sections, such as those dealing with counter tubes, have also been extended.

HALLIDAY, DAVID

Introductory nuclear physics. Second edition. New York: John Wiley & Sons, Inc., 1955. 493 p. illus. 22 cm. $7.50 851

Contents: Basic nuclear concepts. Elements of quantum mechanics. Two-particle systems. Radioactive decay and alpha emission. Gamma radiation and internal conversion. Beta decay. Passage of charged particles and gamma rays through matter. Detection of charged particles and photons. Neutrons. Nuclear masses, mass numbers, and mass abundances. Nuclear structure. Charged particle accelerators. Nuclear reactions. Nuclear fission. Nuclear spin and moments. Cosmic rays and subnuclear particles. References. Appendixes. Index.

HUGHES, DONALD J., AND JOHN A. HARVEY

Neutron cross sections. New York: Pergamon Press Inc., 1955. 328 p. illus. 26 cm. $ 854

Contents: Thermal cross sections: Introduction. Tables—Z<[illegible]—[illegible]. References. Resonance parameters: Introduction. Tables—light nuclei—heavy nuclei—fissionable nuclei. References. Cross section curves: Introduction. Curves. Additional data. References. Angular distributions: Introduction. Curves. References.

Note An edition published in the regular book trade of a reference compendium emanating from the Brookhaven National Laboratory and widely known as *BNL325* It presents in tabular and graphical form "best values" for neutron cross sections as determined by several measurements. In cases where published data was used, references are given to the source publication. Also each of the sections contains an introduction in which the treatment of data used in determining the values given is discussed. A *Supplement* was issued by the United States Government Printing Office in 1957 $1 75

HUGHES, DONALD J

Neutron optics New York Interscience Publishers, Inc. 1954 136 p illus 21 cm (Interscience tracts on physics and astronomy, edited by R. E Marshak) $2 50 855

Contents Principles. Experimental methods. Measurement of nuclear interactions. Measurement of crystal lattice structures. Magnetic scattering.

Note. A rather brief survey of basic principles and applications, designed for readers who have backgrounds in the fundamentals of physics and who understand advanced physical terminology but who are not specialists in nuclear physics. Whenever possible, the author has framed his exposition in terms of analogies to light optics. However he has also stressed the differences between light optics and neutron optics. The chapter on experimental methods and applications in such physical problems as measurements of crystal lattices will be of particular interest to the intended audience. A selection of related literature is cited as footnotes. The author is a member of the staff of Brookhaven National Laboratories.

HUGHES, DONALD J

Pile neutron research. Reading Mass Addison Wesley Publishing Co , 1953 386 p illus 24 cm. (Addison Wesley nuclear science and engineering series, Clark Goodman consulting editor) $10 00 856

Contents Fundamental concepts of neutron physics. The pile as a neutron source. Neutron standardization Fast neutron research. Resonance neutrons in the pile. Resonance neutron beams. Thermal neutrons inside the pile. Neutron diffusion measurements. Thermal neutron beams. Neutron diffraction. Neutron refraction, reflection and polarization. Health physics. Appendices Constants, conversion factors, and formulas Atomic masses. Thermal cross sections. A set of experiments for pile physics course. Symbol index. Index.

Note The new field of pile neutron research is a distinct yet broad one, according to the author "in which physicists, chemists, biologists, and engineers take advantage of the specific facilities that have been developed to make use of pile neutrons The book, on the level of first year graduate course in physics, describes the techniques and the instruments used in pile neutron research, going into some detail for those that are peculiar to this work. New instruments such as choppers, crystal spectrometers, and neutron mirrors are covered in detail. Mathematics is limited to that needed for the explanation of physical principles involved, and useful references enable the reader to find the necessary background information for basic principles that are not fully covered. The chapter on health physics deals with precautionary measures that should be employed to ensure protection from radiation accidents. The author is Senior Physicist at Brookhaven N tional Laboratory

INGHRAM, MARK G , AND RICHARD J HAYDEN

A handbook on mass spectroscopy Prepared for the Subcomittee on Instruments and Techniques of the Committee on Nuclear Science Division of Physical Sciences National Research Council Nuclear science series Report number 14 Washington D C National Academy of Sciences—National Research Council 1954 51 p illus 28 cm (National Research Council Publication 311) $2 00 857

Contents Introduction. Mass analyzers Theory Practice. Ion sources for mass spectroscopy Ion detectors for mass spectroscopy Sample introduction systems for mass spectroscopy List of symbols. References.

Note This publication was originally prepared for the Subcommittee on Nuclear Instruments and Techniques of the Committee on Nuclear Science of the National Research Council as chapter for proposed handbook (subsequently abandoned) on nuclear instruments and techniques. It appears as separate publication to fill the need for a review and compilation of the background information needed for the successful operation of the mass spectrometer as equipment to determine masses of charged ions by electric and magnetic deflection. It is especially useful to investigators in fields other than physics who need assistance in selecting tools and in interpreting data obtained from the mass spectrometer Although the manuscript was completed in April, 1952 and reference to more recent work in the field of mass spectroscopy is necessarily lacking, the handbook is still valuable as source of information on basic principles and procedures of mass spectroscopy

JAUCH, J M , AND F ROHRLICH

The theory of photons and electrons, the relativistic quantum field theory of charged particles with spin one-half Reading Mass. Addison Wesley Publishing Company Inc., 1955 488 p illus 24 cm. $10 00 858

Content General principles. The radiation field. Relativistic theory of free electrons. Interaction of radiation with electrons. Invariance properties of the coupled fields. Subsidiary condition and longitudinal field. The S-matrix. Evaluation of the S-matrix. The divergences in the iteration solution. Renormalization. The photon-electron system. The electron-electron system. The photon-photon system. Theory of the external field. External field problems. Special problems. Appendixes The invariant functions. The gamma-matrices. A theorem on the representation of the extended Lorentz group by irreducible tensors. The ordering theorem. On the evaluation of certain integrals. A limiting relation for the δ-function. The method of analytic continuation. Notation. Author index. Subject index.

Note The authors of this book have stated that for the first time it has become possible to give unified and consistent presentation of radiation theory in full conformity with the principles of relativity and quantum mechanics. T this task the present book is devoted. The book is masterly and comprehensive presentation of the theory of quantum electrodynamics in its present *state of development. The general theory is presented in detail, and* its applications to a selection of problems in physics are discussed in several chapters. Throughout the book the presentation is unavoidably mathematical however much of the highly specialized mathematics appears only in the appendix.

KAPLAN, IRVING

Nuclear physics. Reading Mass. Addison Wesley Publishing Company 1955 609 p illus 24 cm. $9 00 859

Contents Part I, The background of nuclear physics The chemical foundations of atomic theory Atoms, electrons, and radiations. The nuclear atom. *X-rays and atomic structure* The quantum theory of radiation. The special theory of relativity Atomic spectra and atomic structure. Part II, The nucleus The constitution of the nucleus. Isotopes Natural radioactivity and the laws of radioactive transformation. Artificial nuclear disintegration. Artificial radioactivity Alpha-decay Beta-decay Gamma-rays and gamma-decay Nuclear reactions. Nuclear forces and nuclear structure. Part III, Special topics and applications Neutron physics. Nuclear fission Nuclear energy sources. The acceleration of charged particles. Isotope separation Appendixes. Index.

Note A textbook for college students and others who have completed thorough courses in basic physics and an introductory college course in calculus. It is introductory to the field of nuclear physics, however it is broad in coverage and rather detailed. The style of presentation is such that the graduate engineer who wishes an introduction for reading without the guidance of an instructor will find the presentation easy to follow Literature references are included.

LAPP RALPH E , AND HOWARD L ANDREWS

Nuclear radiation physics. Second edition New York Prentice Hall Inc. 1954 532 p illus 23 cm. $7 50 860

Contents: Particles and waves. Atomic structure. Isotopes and nuclear structure. Natural radioactivity. X-rays and gamma rays. Alpha particles. Beta particles. Ionization-chamber instruments. Pulse counters. Particle accelerators. Induced nuclear transformations. Neutron physics. Nuclear fission. Nuclear power. Radiation measurement techniques. Radioactive tracer techniques. Radiation health protection. Appendix. Index.

Note: A textbook for college courses which provides a well-rounded introductory exposition of nuclear physics. The first edition (1948) has been completely revised, recent developments in this rapidly expanding field and further discussion of some of the material previously touched on have been expertly integrated with the original text. As in the first edition, the authors take as their point of departure the more elementary concepts of the physics pertaining to nuclear radiation, and they keep mathematical expression at a minimum.

LIBBY WILLARD F

Radiocarbon dating Second edition. Chicago University of Chicago Press, 1955 175 p. illus. 24 cm. $4.50 861

Contents: Principles. World-wide distribution of radiocarbon. Half-life of radiocarbon. Preparation of the sample for measurement. Measurement of the sample. Radiocarbon data. Reflections upon the significance of radiocarbon dates, by F Johnson. Appendices: Special equipment and chemicals for the C^{14} sample preparation apparatus. Special materials for screen-wall counter. Index of subjects. Index of names. Index of samples.

Note: In its second edition, this pioneer book on the principles and techniques of estimating the ages of organic materials, especially products of archeological interest, by measuring their radioactive carbon contents have been extended in length by some 50 pages. The chapter titles are identical with those of the first edition published in 1952. However revisions and augmentations have been made in the passages on measurement techniques, the tabulations of date determinations have been greatly extended, and Johnson's chapter on the significance of dates established by the radiocarbon method has been substantially revised and enlarged. References to literature published since 1951 have been added.

LIVINGSTON M STANLEY

High-energy accelerators. New York Interscience Publishers Inc., 1954 157 p. illus. 21 cm. (Interscience tracts on physics and astronomy edited by R. E. Marshak) $3.25 862

Contents: High-energy accelerators as tools for nuclear research. Principles of acceleration to high energies. The electron synchrotron. The synchrocyclotron. Linear accelerators. The proton synchrotron. Alternating gradient focusing. References. Index.

Note: The high-energy accelerator is our chief tool in studying the atomic nucleus. In this new book, readers are provided with an exposition of the principles on which such devices are based and descriptions of the chief types which have been developed and are in use. Although the style is largely descriptive and the mathematics used is not difficult, the book is addressed to graduate scientists. It will appeal particularly to such readers as teachers of physics and graduate students who are preparing for careers in nuclear research.

MARSHAK, ROBERT E

Meson physics. New York McGraw Hill Book Company Inc., 1952 378 p. illus. 24 cm. (International series in pure and applied physics G P Harnwell, consulting editor) $8.00 863

Contents: Single production of [illegible] mesons in photon-nucleon collisions. Single production of [illegible] mesons in nucleon-nucleon collisions. Nuclear production of slow [illegible] mesons. Properties of [illegible] mesons. The capture and absorption of slow negative mesons. Properties of the [illegible] meson. Nuclear interaction of fast [illegible] mesons. Production of mesons at relativistic nucleon energies. New particles and new processes. Name index. Subject index.

Note: A survey of the knowledge accumulated to the date of writing, on the production, properties, and nuclear interactions of mesons. Source articles and reports are cited in footnotes. The author points out that he has restricted himself to "real meson processes," and has not attempted to cover virtual meson theory. The book originated in a series of lectures delivered at the University of Rochester and at Columbia University in 1950. It is addressed to advanced graduate students and to graduate physicists.

MAYER MARIA GOEPPERT AND J HANS D JENSEN

Elementary theory of nuclear shell structure New York John Wiley & Sons Inc., 1955 269 p. illus 24 cm. $8.25 864

Contents: Stable nuclei. Empirical evidence for the magic numbers. Review of electronic structure of atoms. Individual orbits in the nucleus. Properties of nuclear ground states. Discussion of the empirical data for odd-A nuclei. Determination of parity and occupation numbers by the angular distribution of (d,p) and (d,n) reactions. Quadrupole moments and isotope shifts. β decay in particular for nuclei of odd A. Light nuclei. Nuclei of even A. General facts about nuclear spectroscopy. Isomerism in nuclei of odd A. Appendices: Eigenfunctions of [illegible] single-particle orbits. Coupling of identical nucleons. Coupling of non-identical nucleons. Multipole moments and their radiation fields. Index.

Note: The concept of nuclear shells, analogous to the shells in the electronic structure of noble gas atoms, has proved to be a useful framework for correlating a considerable mass of observations and data on nuclear properties. This book is an authoritative carefully written exposition and survey of the shell theory and of the qualitative and quantitative knowledge that may be systematized by its use. Elementary in level as indicated by the title, it is addressed to such readers as graduate students preparing for careers in nuclear physics and for graduate physicists in other fields who wish to keep abreast with thought and progress in nuclear physics. Although there are occasional references to quantum mechanics in the main part of the book, mathematics beyond the knowledge of the average physics graduate is found only in the appendices.

MILLIKAN ROBERT ANDREWS

Electrons (+ and —) protons photons neutrons, mesotrons and cosmic rays. Revised edition 1947 Chicago University of Chicago Press 1947 642 p. illus. 19 cm. $9.00 865

Contents: Early views of electricity. The extension of the electrolytic laws to conduction in gases. Early attempts at the direct determination of e. General proof of the atomic nature of electricity. The exact evaluation of e. The mechanism of ionization of gases by X-rays and radium rays. Brownian movements in gases. Is the electron itself divisible? The structure of the atom. The nature of radiant energy. Waves and particles. The spinning electron. The discovery of the cosmic rays. The direct measurement of the energy of cosmic rays and the discovery of the free positive electron. The neutron and the transmutation of the elements. The release and utilization of nuclear energy. Geomagnetic studies in cosmic rays at low altitudes, 1932–36. The mesotron. The nature and number of the incoming primary rays. The atom-annihilation hypothesis as to the origin of the cosmic rays. Appendixes. Indexes.

Note: The author of this book—during his lifetime one of the most eminent of American physicists—received the 1923 Nobel Prize in physics in recognition of his famous oil-drop experiment and other work on the electron. The first edition of this book appeared in 1917 and was titled simply The electron. The changed title, which first appeared in the 1935 edition, reflects the enlargement of the scope of the book to include additional topics in nuclear physics. In this revised and final edition, the last six chapters of the 1935 edition have been replaced by the five detailed chapters whose titles are listed above, beginning with "The release and utilization of nuclear energy." These chapters account for approximately one-third of the length of the volume. Although some parts of it are now outdated, the book enjoys the status of a classic. It is written in a nontechnical style, and is appropriate for reading by such groups as advanced undergraduate students who are majoring in physics. It is important, also, as a first-hand account of some of the author's own work.

MITCHELL ALLAN C G AND MARK W ZEMANSKY

Resonance radiation and excited atoms. New York Cambridge University Press 1934 338 p. illus. 22 cm. $6.50 866

Contents Introduction. Physical and chemical effects connected with resonance radiation. Absorption lines and measurements of the lifetime of the resonance state. Collision processes involving excited atoms. The polarization of resonance radiation. Appendix. Index.

Note A comprehensive, critical account of the knowledge of resonance radiation down to approximately the beginning of 1934. It is concerned with the phenomena and theory; however some of the applications that have been developed, for example sodium vapor lamps, are foreshadowed. The book is based on the literature and careful references to source articles are a feature. The author named first on the title page (Mitchell) is currently Chairman of the Department of Physics of Indiana University and his colleague is Head of the Department of Physics in the College of the City of New York.

MOORE, CHALLOTTE EMMA

Atomic energy levels as derived from the analyses of optical spectra. Volume I The spectra of hydrogen, deuterium tritium, helium, lithium beryllium, boron carbon, nitrogen oxygen fluorine, neon, sodium, magnesium aluminum, silicon, phosphorus sulfur, chlorine, argon, potassium, calcium, scandium, titanium and vanadium Washington, D C Government Printing Office, 1949 309 p 30 cm (United States Department of Commerce National Bureau of Standards Circular 467 issued June 15, 1949) $2 75 867

—— Volume II The spectra of chromium manganese iron cobalt, nickel copper zinc, gallium, germanium arsenic, selenium bromine, krypton rubidium strontium yttrium zirconium and niobium Washington D C Government Printing Office 1952 227 p 30 cm. (United States Department of Commerce. National Bureau of Standards Circular 467 issued August 15, 1952) $2 25 868

Note These are the first two volumes in a series "being prepared at the National Bureau of Standards as part of a general program on the compilation of atomic energy levels derived from analyses of atomic spectra." In most instances the data are taken from published literature, and references to the source articles are given. However information from unpublished material also is included. The series is an indispensable reference work for atomic physicists, astrophysicists, and even for chemists interested in atomic structure.

NATIONAL RESEARCH COUNCIL DIVISION OF ENGINEERING AND INDUSTRIAL RESEARCH BUILDING RESEARCH ADVISORY BOARD

Laboratory design for handling radioactive materials Proceedings of a research conference sponsored by The American Institute of Architects and the Atomic Energy Commission and conducted by the Building Research Advisory Board of the National Research Council, November 27 and 28 1951 Washington, D C National Research Council—National Academy of Sciences 1952 140 p illus 28 cm (National Research Council Division of Engineering and Industrial Research. Building Research Advisory Board. Research conference report no 3) $4 50 869

Contents Session 1 Architectural introduction to radiochemical laboratory layout Main article, by A. Mackintosh. Panel discussion, by G G. Manov and others. General discussion. Session 2 Air supply and exhaust in laboratories handling radioactive materials Main article, by C. P Roberts. Panel discussion, by L. Silverman and others. General discussion. Session 3 Control and shielding of isotopes in radioactive laboratories Main article, by N B Garden. Panel discussion, by W. M. Ries and others. General discussion. Session 4 Surfaces and finishes for radioactive laboratories Main article, by J. G. Terrill. Panel discussion, by C. D Watson and others. General discussion. Session 5, Disposal of radioactive wastes Main article, by E. C. Pluer Panel discussion, by R. H. Simon and others. General discussion. Summaries of the conference by W H. Schaick and others. Some written comments on papers and discussions. Glossary of terms used in nuclear science and technology Bibliography Attendance at the conference.

Note The proceedings of a symposium held in 1951 on the subject of the design of laboratories for handling radioactive materials, the first symposium of its kind, are printed in full in this volume. They form a comprehensive source of general and technical information for those concerned with the design and construction of "hot" laboratories. Emphasis is upon the design of facilities for handling tracer quantities of radioactive materials in all types of laboratories—scientific, medical, agricultural, and industrial.

NELMS, ANN T

Graphs of the Compton energy-angle relationship and the Klein Nishina formula from 10 Kev to 500 Mev Washington, D C Government Printing Office, 1953 89 p illus. 26 cm (United States National Bureau of Standards Circular 542) $0 55 870

Contents Symbols. Introduction. Radiative correction to the Klein-Nishina formula for free electrons. Experimental studies of the Compton effect. Corrections to the Klein-Nishina formula in case of small moment transfer. General procedure and accuracy of calculations. Discussion of graphs. References. Graphs.

Note The Compton energy-versus-angle relationship and the differential and integral Klein-Nishina cross sections are here presented graphically as functions of the energy and direction of the scattered photon and of the recoil electron. The graphs are intended to serve the purpose of tables, the advantage of this form of presentation being the convenience and accuracy of two-way interpolation. The publication is one of a series of surveys and tabulations of information on radiation physics being carried out with the support of the Biophysics Branch of the Atomic Energy Commission. The graphs, of which there are 31, form parts of eight figures and are divided into three groups as follows: Compton energy-angle relationship, Differential Klein-Nishina cross section per electron, Integral Klein-Nishina cross section per electron.

OLDENBERG OTTO

Introduction to atomic physics. Second edition. New York McGraw Hill Book Company, Inc. 1954 421 p. illus 23 cm. $6 75 871

Contents Part I, Structure of matter as revealed in chemistry: The atomic hypothesis and Avogadro's rule. Some results and definitions of chemistry. Part II, Gases: Explanation of pressure and temperature. Experimental tests of the kinetic theory. Mean free path. Report of further development. Part III, Structure of electricity: Determination of e/m. Determination of the charge of the electron. Part IV Structure of light: Photoelectric effect and the quantum of light. Part V Electronic structure of atoms: Nuclear atom as revealed by alpha-ray scattering. Spectrum of the hydrogen atom and Bohr's theory. More complicated spectra. Fundamental processes. Periodic table of elements. X rays. Solid state. Part VI, Nuclear structure: Isotopes. Natural transmutation and radioactivity. Artificial transmutation and radioactivity. Fission and fusion. Cosmic rays. Part VII, Wave nature of matter: Diffraction of electrons. Report on wave mechanics. Appendices. Index.

Note An elementary treatment of fundamental atomic theory designed for students and other readers who have a knowledge of basic physics and chemistry. It was developed in an introductory course in atomic physics which the author has given at Harvard University for many years. Its most outstanding quality derives

from the care the author has taken to describe the experiments and observations upon which the modern knowledge of the atom is based. Most of the exposition is in physical terms, with little use of mathematics. The first edition was published in 1949. Considerable reorganization and revision is evident in this second edition. Although it is only about 50 pages longer, it contains several chapters that did not appear in the first edition, including one on [illegible] and [illegible], several chapters and parts of chapters of the first edition have been deleted. The reference material in the appendices has been revised, and [illegible] list of references to other books added.

PANEL ON THE IMPACT OF THE PEACEFUL USES OF ATOMIC ENERGY

Peaceful uses of atomic energy Report of the Panel on the Impact of the Peaceful Uses of Atomic Energy to the Joint Committee on Atomic Energy of the United States Congress. Washington, D C. Government Printing Office, 1956 2 v illus. 23 cm. (United States. 84th Congress 2nd Session. Joint Committee Print) Vol. 1 $0 45 vol. 2 $2.00 872

Contents Current framework for the development of peaceful uses of atomic energy Atomic power. Controlled thermonuclear power and direct conversion of [illegible] energy Medicine and public health Agriculture. Radiation preservation of food. Atomic propulsion. General industrial uses. Impact on the United States of peaceful atomic developments abroad. Public and private activities as they affect development of the peaceful uses. Control of information. Research and development. Manpower—education of the public and the individual. Hazards, protection, and insurance. Ownership of special nuclear materials, licensing and regulation. Financial involvement. Patents. Government organization.

Note In 1955 the Joint Committee on Atomic Energy of the United States Senate and House of Representatives established the Panel named above and gave [illegible] four main instructions: (1) to appraise the present and future impact of all aspects of the development of atomic energy on the economy, industry and natural interests of the United States (2) to consider also the effects of the application of atomic energy upon economies and industries abroad, (3) to study the activities of the Atomic Energy Commission as they affect the foregoing, ( ) to recommend to the Joint Committee any legislation or policy actions needed to speed the development of peaceful uses of atomic energy The panel was instructed also to prepare and submit by January 31, 1956, [illegible] report on its activities and findings. These two volumes are the result. The first volume, 133 pages in length, contains the report, conclusions, and recommendations of the panel under 15 different headings. The second volume, 149 pages in length, contains the background material collected by the panel in preparing its report and not previously published elsewhere. For convenience the material in the second volume [illegible] arranged in chapters corresponding with the chapters and numbering of Volume [illegible] The two volumes together contain [illegible] substantial body of information on atomic energy of value both to specialists and to general readers.

PAULI, WOLFGANG

Meson theory of nuclear forces. Second edition. New York Interscience Publishers, Inc., 1948. 69 p. illus. 21 cm. $4.00. 873

Contents Various types of meson fields. Scalar charged meson field, Pseudoscalar symmetric theory Vector-field theory Theory of [illegible] [illegible]. Scattering of mesons. Magnetic moment in the strong coupling case. Magnetic moment in the weak coupling case. Quantum theory of scattering Theory of radiation damping. Heisenberg's observable quantities. Proof that S is unitary Theory of meson-proton scattering, Strong coupling theory of the two-nucleon system. Concluding remarks Appendix.

Note. The lectures that make up this volume were delivered in substantially their present form at Massachusetts Institute of Technology in 1944. In them the author critically examines various problems and hypotheses that bear on the meson theory of nuclear forces. The discussion is largely in mathematical terms and is intended for persons with an advanced knowledge of physics. The second edition is the same as the first (1946) except for the addition of about three pages that deal with later work on meson-proton scattering and the strong coupling theory.

PEASLEE, D C., AND H MUELLER

Elements of atomic physics. New York Prentice-Hall, Inc., 1955 394 p. illus. 24 cm. $7.50. 874

Contents Part I, The facts of atomic structure: Atoms and elementary chemistry Atoms as components of matter. Particle beams in electric and magnetic fields. Magnetic, optical, and [illegible] properties of atoms. X-rays. Photons and X-ray spectra. Optical spectra. Part II, Theoretical interpretation of the facts Special theory of relativity Wave mechanics. The Schroedinger equation. Electron spin and multiplet spectra. The periodic table exclusion principle and other topics. Part III, Further applications of the theory Modern developments. Quantum statistical mechanics. Appendices. Answers to even numbered problems. Index.

Note An introductory textbook, carefully planned to make available to undergraduate college students an understanding of modern physics in general and atomic physics specifically The main facts gathered by measurement and experimentation are described in the first part of the book, and it is shown that the concepts and laws of classical mechanics are not adequate to explain all of them. The demonstrated inadequacy is used as [illegible] supplying frame to the exposition of quantum mechanics and the related theory [illegible] which are developed in the second and third parts. As aids to comprehension, each of the three parts is prefaced with an explanation of [illegible] what will be expounded in it, and each of the chapters includes [illegible] summary of the ground covered in it. Selected literature references are another feature.

POLLARD ERNEST CHARLES, AND WILLIAM L. DAVIDSON

Applied nuclear physics. Second edition New York John Wiley & Sons Inc., 1951 352 p illus. 24 cm. $6.00. 875

Contents Fundamentals, nuclei, and atomic energy Properties of nuclear particles. The detection of nuclear particles. Methods of accelerating atomic particles. Transmutation. Radioactivity Technique in artificial radioactivity Artificial radioactivity in practice. Stable isotopes and their applications. Nuclear fission. Nuclear chain reactions. Nuclear theory and cosmic rays. Appendix. Author index. Subject index.

Note The first edition of this book, published in 1942, was one of the few pre-World War II books to include an account of nuclear fission. Though there are now many others that contain information on this subject, this work is still [illegible] useful text. A good deal of new material has been added in this edition, including discussions of pile theory nuclear chain reactions, and an extensive table of data on isotopes. The book is written at the college level and is intended for students who have studied general physics.

RAMSEY NORMAN F

Nuclear moments. Reprinted in part from Segrè (editor) Experimental nuclear physics, Vol. 1. New York John Wiley & Sons, Inc., 1953 169 p illus. 24 cm. $5.50 876

Contents Introduction to nuclear moments and statistics. Interaction of [illegible] nucleus with atomic and molecular fields. Experimental methods of measuring nuclear moments and statistics. Results of measurements of nuclear moments and statistics. Applications to chemistry and solid state physics. Appendix. References. Author index. Subject index.

Note. The first four parts of this book have been reprinted—as noted in the title—from E. Segrè editor Experimental nuclear Physics, Volume [illegible] However, the fifth chapter which runs to 38 pages is new Some additions have been made to the list of references, and the indexes have been made especially for this volume. The result is [illegible] relatively brief graduate-level text and survey suitable for use by chemists and physicists engaged in research in which nuclear moment measurements are of interest.

RICE, FRANCIS OWEN AND EDWARD TELLER

The structure of matter New York John Wiley & Sons, Inc., 1949 361 p. illus 24 cm. (Structure of matter series edited by Maria Goeppert Mayer) $7.25 877

Contents: Introduction. The hydrogen atom. The periodic system. Motion and position of nuclei in molecules. Atoms and molecules in electric fields. Van der Waals attraction forces. The chemical bond. Forces in the solid state. Magnetic properties of matter. Molecular vibrations. Electronic spectra. Nuclear chemistry. State of matter in stars. Index.

Note In this work, fundamental atomic phenomena and their grosser manifestations, such as spectra, chemical bonds, and magnetism, are explained in the concepts and terms of quantum mechanics. Thus it is both an exposition of modern atomic physics and an introduction to the applications of quantum mechanics. The presentation has been kept as simple as possible so that the book will be useful to chemists, engineers, and others who need a nonspecialist's knowledge of quantum mechanics. Within each chapter the exposition is developed under short sub-topics, an arrangement that facilitates comprehension and makes the book easier to use as a reference aid or as a "refresher."

ROSE, M E

Multipole fields New York John Wiley & Sons, Inc., 1955 99 p illus. 24 cm. $4 95 878

Contents The classical field equations. The multipole fields. Properties of the multipole fields. The retarded electromagnetic interaction. Internal conversion. Emission of gamma radiation. Appendices. References. Index.

Note. In this book the theory of multipole fields, which implies the representation of Maxwell fields in terms of the algebra of irreducible tensors, is explored. The properties of such fields are examined, and the theory is applied to selected problems in electromagnetics and nuclear radiation. The book can be described as an advanced-level mathematical study in which the emphasis is on the angular-momentum and parity properties of multipole fields. Readers will need a prior knowledge of quantum mechanics and electromagnetic theory on a graduate level. The author is Chief Physicist in the Oak Ridge National Laboratory and the book is addressed primarily to other physicists engaged in nuclear research.

ROSSI, BRUNO

High-energy particles New York Prentice-Hall, Inc., 1952 569 p illus 24 cm. (Prentice-Hall physics series, Donald H. Menzel, editor) $12 50 879

Contents Introduction. Theory of electromagnetic interactions. Experimental methods. Elementary particles. Cascade showers. Experimental results on the electromagnetic interactions of high-energy particles in cosmic rays and from artificial sources. Nuclear interactions of high-energy particles from artificial sources. Nuclear interactions of cosmic rays. Appendices. Bibliography. Index.

Note Although most of the text of this book is written in narrative style it is essentially a reference book of the accumulated knowledge on the elementary particles of physics and on their behavior at high energies. Basic properties, phenomena, experimental methods, and useful formulae are included. Many data are assembled in tables or represented in graphs. The book is addressed to graduate students and research workers in nuclear physics, cosmic radiation, and related fields.

SACHS, ROBERT G

Nuclear theory Reading Mass Addison Wesley Publishing Company, Inc., 1953 383 p illus 24 cm. $8 50 880

Contents: Part I, The nuclear force problem Introductory remarks. Qualitative discussion of nuclear forces. Part II, The two-body problem Ground state of the deuteron. Excited states of the deuteron. S-scattering by bound nuclei. Further considerations of the two-body problem. Remarks on the meson theory of nuclear forces. Part III, Complex nuclei Structure of complex nuclei. Electromagnetic interactions of nuclei. Nuclear reactions. Concerning beta decay Appendixes. Author index. Subject index.

Note A textbook designed as an introduction to nuclear theory for graduate students in physics. The author's aim was to present the basic concepts and mathematical techniques, accordingly the book is written in terms of ordinary Schroedinger quantum mechanics. Nearly half of the space is devoted to two-body (deuteron and proton) systems. A selection of the pertinent literature is cited as footnotes throughout the book. The author is Professor of Physics in the University of Wisconsin.

SCHWEBER, SILVAN S, AND OTHERS

Mesons and fields Volume I, Fields. By Silvan S Schweber, Hans A. Bethe, and Frederic de Hoffmann Volume II, Mesons By Hans A. Bethe and Frederic de Hoffmann. Evanston Row, Peterson and Company, 1955 2 v illus. 23 cm. $8 00 per vol. 881

Contents (abridged) Volume I, Fields One-particle relativistic wave equations The Klein-Gordon equation. The Dirac equation. Transformation properties and magnitude of Dirac operators. Calculational aids. Feynman's positron theory Applications of Feynman's theory Field theory: Fields and interaction—Interaction between fields—Interaction with the electromagnetic field. Quantum theory of fields—Scattering of the S matrix—The covariant formalism—Feynman diagrams. The renormalization program—The self energy of a Fermion—The divergences—Renormalizable and nonrenormalizable theories—Recent developments. Appendixes. References. Index. Volume II, Mesons. Meson physics. Meson scattering—Isotopic spin formalism in meson theory—Phase shift analysis—Low energy scattering experiments—High energy scattering (above 120 Mev) Photoproduction Meson theory: Development of meson theory 1947–1955—The Tamm-Dancoff method—The relativistic integral equation for meson scattering—Renormalization problems—Recent theories of photoproduction of mesons—The magnetic moment of the nucleon—Theory of nuclear forces. Meson production by particles. Other mesons The μ meson—"Curious" particles. Appendixes. References. Index.

Note The complicated authorship of this work is best described by quoting from the preface to Volume I "Volume I as it now stands, is predominantly the work of S. S. Schweber Volume II that of H. A. Bethe and F de Hoffmann. The original draft of some of the sections of Volume I is due to H. A. Bethe and F de Hoffmann. The pressure of other duties made it impossible for F de Hoffmann to work on Volume I to any substantial extent beyond the first stages. After this, S. S. Schweber assumed primary responsibility with advice from H. A. Bethe. The work was developed from advanced graduate courses given at Cornell University in 1953 and 1954 Volume I is a survey and development of modern field theory The authors have stated, "We have attempted to keep the presentation, as far as possible, simple and close to familiar concepts. For this reason, we have used as our main basis Dyson's approach of 1949 rather than the more modern and fundamental reformulations of Schwinger and Feynman during 1950 and 1951." A knowledge of basic quantum mechanics on the part of readers is assumed. Volume II is a survey and analysis of experimental results pertaining to mesons, with incidental discussions of other mesons. One of the major sections is devoted to meson theory. The first volume can be studied without reference to the second volume. Although the second volume is essentially independent, those readers who are interested in the theory will find it necessary to read sections of it in order to fully understand Volume II. Extensive literature references are included in both volumes.

SEGRÈ, E, editor

Experimental nuclear physics Vol I II New York John Wiley & Sons Inc. 1953 2 v illus. 23 cm Vol I $15 00 vol II $12 00 882

Contents. Volume I. Part I, Detection methods, by H. H. Staub Fundamental principles of particle detection Electronic instruments. Typical constructions and methods of operation of counters and cloud chambers. Part II, Passage of radiations through matter by H. A. Bethe and J Ashkin The passage of heavy particles through matter Penetration of beta-rays through matter Penetration of gamma-rays. Part III, Nuclear moments and statistics, by N F Ramsey Introduction to nuclear moments and statistics. Interaction of nucleus with atomic and molecular fields. Experimental methods of measuring nuclear moments and statistics. Results of measurements of nuclear moments and statistics. Part IV Nuclear two-body problems and elements of nuclear structure by N F Ramsey Introduction. Nuclear two-body problems. Heavier nuclei. Part V Charged particle dynamics and optics, relative isotopic abundances of the elements, atomic masses, by K. T Bainbridge Introduction. The deflection and focusing of charged particles in magnetic and electric fields. The relative abundance of isotopes. The measurement of isotopic weights. Author index. Subject index. Volume II. Part VI, A survey of nuclear reactions, by P Morrison The conservation laws. The data of nuclear reactions. The nuclear model. Nuclear level widths. The course of nuclear reactions. The dispersion theory—resonance reactions. Some typical nuclear reactions. The deuteron as a projectile. Radiative processes in nuclear

reactions. Nuclear fission. Nuclear reactions at high energy. Part VII. The neutron, by B. T. Feld. Properties and fundamental interactions. Interaction with nuclei. Sources and detectors—neutron spectroscopy. The interaction of neutrons with matter in bulk. Coherent scattering phenomena with slow neutrons. Author index. Subject index.

Note: A treatise planned as a basic work for graduate physicists and graduate students preparing for research in nuclear physics. As indicated in the above contents, it is composed of parts written by eminent nuclear scientists. Generally speaking, each author has outlined fundamental theory, described experimental techniques, and supplied the necessary reference data. In the work as a whole the primary emphasis is on experimental techniques and interpretation of experimental results. The stage of knowledge presented is approximately that at the end of the year 1951. Because it is somewhat out of date, the work is useful primarily as an introductory survey to be supplemented by study of the more recent literature. A projected third volume has not been issued.

SEMAT HENRY

Introduction to atomic and nuclear physics. Third edition revised and enlarged of *Introduction to atomic physics* New York Rinehart & Company Inc., 1954 561 p. illus. 23 cm. $6.50. 883

Contents: Part 1, Foundations of atomic and nuclear physics: Elements of electricity and magnetism. Charged atomic particles. The nuclear atom. Electromagnetic radiation. X-rays. Waves and particles. Part 2, The extranuclear structure of the atom. The hydrogen atom. Optical spectra and electron distribution. X-ray spectra. Part 3, Nuclear physics. Natural radioactivity. Disintegration of nuclei. Nuclear processes. Nuclear fission. Fundamental particles. New elements and isotopes. Particle accelerators. Appendixes. Index.

Note: A successful introductory textbook used in the instruction of undergraduate college students who have completed courses in basic physics and calculus. The lengths of the three respective parts whose titles are given above are: Part 1, 221 pages; part 2, 90 pages; part 3, 207 pages. The book is well organized for study and includes both problems for the student to solve and selected literature references. In comparison to the preceding edition published under the title *Introduction to atomic physics* it is 150 pages longer and contains a wide range of additional information. The author is Professor of Physics on the faculty of the College of the City of New York.

SHANKLAND ROBERT S

Atomic and nuclear physics. New York The Macmillan Company 1955 529 p. illus. 25 cm. $7.50 884

Contents: The atom and kinetic theory. The electron. Atomic structure and spectra. Molecular structure and spectra. X-rays. The solid state of matter. Isotopes and nuclear structure. Natural radioactivity. Induced nuclear transformations. Nuclear energy sources. High-energy nuclear processes. Cosmic rays. Index.

Note: This book is an introductory text addressed to advanced undergraduate and graduate students majoring in physics. The author has taken pains to explain basic ideas such as the uncertainty principle. Also, he has described at some length the methods and significance of the major experiments which advanced atomic and nuclear knowledge. Toward the end of the book the various types of nuclear reactors are described. Literature references are furnished. Although not primarily a mathematical treatment the reader will need somewhat more skill in mathematics than is usually gained from an introductory course in "college mathematics." Besides its textbook use, the book is useful in libraries for its definitions and descriptions.

THORNDIKE, ALAN M.

Mesons, a summary of experimental facts. New York McGraw Hill Book Company Inc., 1952 242 p. illus. 24 cm. (International series in pure and applied physics G P Harnwell, consulting editor) $6.00. 885

Contents: Evidence for the existence of mesons. Properties of cosmic-ray mesons. New types of mesons. Artificially produced mesons. Decay of mesons. Interaction of mesons with matter. Production of mesons in cosmic radiation. Occurrence of mesons in cosmic radiation. Glossary. List of symbols in equations. Name index. Subject index.

Note: The available knowledge on the existence and properties of mesons is presented in this book, and this knowledge is directly related to the experiments from which it has been derived. Experimental techniques are at least outlined, but in most instances the reader is referred to the original publications for detailed descriptions. However, results are fully described and are integrated with the body of experimental knowledge. No attempt is made to present meson theory. Substantial lists of literature references are included in the chapters. The book is intended as an introduction to the subject for graduate college students majoring in nuclear physics, and the style of presentation is largely descriptive.

WAY KATHARINE, AND OTHERS compilers

Nuclear level schemes. A = 40 — A = 92 (covering the elements Ca Zr) A collection of diagrams showing positions and properties of nuclear energy levels characteristics of radioactive decay and nuclear reactions, together with a tabular compilation of the experimental data and bibliographic references to the original papers. Compiled by K. Way R. W King C. L. McGinnis, and R. van Lieshout, Nuclear Data Project, Committee on Tables of Constants and Numerical Data, National Academy of Sciences—National Research Council Washington, D C. Washington, D C. Government Printing Office 1955 221 p. illus. 27 cm. (United States. Atomic Energy Commission. TID 5300) $1 75 886

Contents: Introduction. Abbreviations. Nuclear level schemes and tabular data. Binding energy charts. Mass links. Data for natural elements and unassigned activities. Table of nuclear moments. Relative isotopic abundances. Thermal neutron absorption cross sections. Beta decay systematics. Index of level schemes for different mass numbers, A. Alphabetical index of elements and isotopes.

Note: The first section of a tabular work originally planned as a revision of National Bureau of Standards circular 499, 1950, and three supplements, 1950–1951. As the backlog of nearly 4,000 new papers issued after 1950 on radioactivity and nuclear levels mounted, it became apparent that entirely new methods of organizing and presenting the material were called for, as explained in detail in the introduction to the new work. The compilation is designed for those concerned with nuclear technology as well as for those interested primarily in the fundamental problems of nuclear structure. Included are decay schemes for all known radioactive nuclei with mass numbers A = 40 through A = 92 in the region 20 Ca — 40 Zr. These schemes show explicitly the percentages of disintegrations in which the different β radiations are emitted and, in the case of positron emitters, the percentages of electron capture which are to be expected in addition to the particle transitions. Other pertinent data have also been computed and are shown on all the diagrams. The next section of the work will cover approximately the following 20 elements in the Periodic Table.

YAGODA, HERMAN

Radioactive measurements with nuclear emulsions New York John Wiley & Sons Inc., 1949 356 p illus. 22 cm. $9 00 887

Contents: Photographic detection of nuclear particles. Comparison of scintillation and photographic methods. Laboratory manipulations. Alpha-particle patterns on nuclear emulsions. Quantitative aspects of the alpha-particle pattern. Radiochemical studies with nuclear emulsions. Alpha-particle patterns of uranium and thorium minerals. Alpha tracers in crystallography and metallurgy. Biological applications of alpha-particle tracers. Principles of beta-particle autoradiography. Applications of beta-ray patterns. Applications in nuclear physics. Bibliography. Appendixes: Range-energy relations in Ilford nuclear research emulsions. Atomic constants and conversion factors. Author index. Subject index.

Note: A monograph on the use of photographic emulsions in the detection, analysis, and measurement of radioactive radiations. It is written on the research level and is intended for the information of biologists and physicists. Though the historical development is covered, the greater part is devoted to techniques, which are described in adequate detail for practical laboratory use. The book is based on an extensive literature survey. Keyed references to sources are incorporated in the text.

RELATIVITY

ABRO, A. D'

The evolution of scientific thought from Newton to Einstein Second edition revised and enlarged New York Dover Publications, Inc., 1950 481 p illus 21 cm $2 00 888

Contents. Part I, Pre-relativity physics Manifolds. The birth of metrical geometry Riemann's discoveries and congruence. The problem of physical space. An alternative view of non-Euclidean geometries. Time. Systems of co-ordinates and distance. The meaning of the word relativity The principles of relativity Classical mechanics and the Newtonian principle of relativity The ether The equations of electromagnetics and Lorentz's theory Part II, The special theory of relativity: Einstein's special theory of relativity Relativistic mechanics. Consequences of the new space and time measurements—simultaneity Practical congruence in relativity The mathematical expression of Einstein's fundamental premises. The discovery of space-time. The irreversibility of time. The reality of the contraction of lengths and of the lengthening of durations. The paradoxes associated with space-time and the trip to the star Part III, The general theory of relativity: Potentials and forces. The postulate of equivalence. The inclusion of gravitation in the model of space-time. Tensors and the laws of nature. The principle of general covariance, or the general principle of relativity The discovery of the Einsteinian law of gravitation. The general laws of motion. The verification of Einstein's law The separation of space-time into space and time in a gravitational field. The principles of conservation. Other aspects of the gravitational equations. The finiteness of the universe. The importance of space-time, and the principle of action. The mystery of matter The theories of Weyl and Eddington. Part IV The methodology of science The methodology of science. The general significance of the theory of relativity Appendix: The space and time graphs.

Note Essentially an interpretation of relativity for the general reader Relativity is presented as a logical development in the stream of physical thought in which the contributions of Newton, Maxwell, Riemann, Planck and many other scientists are landmarks and the importance of whose work is made clear About one-fourth of the space is devoted to physics before the theory of relativity and the terminal part contains a long chapter—about 100 pages—on the methodology of science. All of the remainder is given over to a detailed, non-mathematical explanation of the special and general theories of relativity and of their significance to physics. The first edition was published in 1927 In the second edition, errors were corrected, and the chapter entitled "The finiteness of the universe" was revised and slightly extended.

BERGMANN, PETER GABRIEL

Introduction to the theory of relativity Foreword by Albert Einstein New York Prentice-Hall Inc 1942 287 p 23 cm. (Prentice-Hall physics series) $5 25 889

Contents Part I, The special theory of relativity Frames of reference, coordinate systems and coordinate transformations. Classical mechanics. The propagation of light. The Lorentz transformation. Vector and tensor calculus in an *n* dimensional continuum. Relativistic mechanics of mass points. Relativistic electrodynamics. The mechanics of continuous matter Applications of the special theory of relativity Part II, The general theory of relativity The principle of equivalence. The Riemann-Christoffel curvature tensor The field equations of the general theory of relativity Rigorous solutions of the field equations of the general theory of relativity The experimental tests of the general theory of relativity The equations of motion in the general theory of relativity Part III, Unified field theories Weyl's gauge-invariant geometry Kaluza's five dimensional theory and the projective field theories. A generalization of Kaluza's theory Index.

Note The theory of relativity is presented as a theory in physics rather than in pure mathematics. Only a physicist's knowledge of mathematics is necessary to understand this text. The specific apparatus needed in relativity—tensor calculus and Ricci calculus—is developed in the book itself. Problems are introduced which familiarize the reader with the mathematical apparatus and illustrate the physical aspects of the theory The book is divided into the topics of the special theory of relativity the general theory of relativity and the unified field theories.

COLEMAN, JAMES A

Relativity for the layman a simplified account of the history theory, and proofs of relativity Illustrated by the author New York The William-Frederick Press, 1954 131 p illus 21 cm $2 75 890

Contents The velocity of light. The great dilemma. The special theory of relativity Experimental proof of the special theory The general theory and experimental proof Relativity and the nature of the universe. The unified field theory Index.

Note Relativity is not an easy field of science to explain to readers who lack education in mathematics. The author of this book, which is addressed to readers who have very little facility in mathematics has, however succeeded fairly well. He has used many analogies in explaining such concepts as the principle of equivalence. On the other hand, he has not avoided mathematics altogether. The basic equations are quoted, and their meanings are described as well as possible in nonmathematical terms. The discussions of the experimental proofs of the Special theory and the General theory add considerable interest to the book.

EINSTEIN, ALBERT

The meaning of relativity Fifth edition, including the *Relativistic theory of the non-symmetric field* Princeton Princeton University Press, 1955 169 p 21 cm. $3 75 891

Contents: Space and time in pre-relativity physics. The theory of special relativity The general theory of relativity Appendix: Relativistic theory of the non-symmetric field. Index.

Note: This authoritative interpretation of relativity is too well known to require description at this date. The first edition appeared in 1922 The second edition appeared in 1945 and contained an appendix on advances in the theory of relativity which had taken place since the writing of the first edition in 1921 The third edition published in 1950 contained a second appendix in which Einstein stated his generalized theory of gravitation. In this fifth and final edition that second appendix has been replaced with one entitled "Relativistic theory of the non-symmetric field," in which Einstein restated the generalized theory with the object of simplifying the derivations and making the theory more clear

LIEBER, LILLIAN ROSANOFF

The Einstein theory of relativity Drawings by Hugh Gray Lieber New York Rinehart & Company, Inc., 1945 324 p illus. 21 cm. $3 50 892

Contents (abridged) Part I, The special theory The Michelson-Morley experiment, Re-examination of the fundamental ideas. The remedy The result of applying the remedy The four-dimensional space-time continuum. Some consequences of the theory of relativity Part II, The general theory The principle of equivalence. A non-Euclidean world! The study of spaces. What is a tensor? The effect on tensors of a change in the coordinate system. Mixed tensors. Contraction and differentiation. The little g's. The curvature tensor at last. The big G's or Einstein's law of gravitation. Comparison of Einstein's law of gravitation with Newton's. How can the Einstein law of gravitation be tested? More about the path of a planet. The perihelion of Mercury Deflection of a ray of light. The third of the "crucial" phenomena. Summary

Note. The purpose of this book is to fill the need for a presentation between the popular and the expert levels of the Einstein theory of relativity The authors have written several other books in which difficult mathematical concepts have been explained for general readers, and they have developed original techniques for both the textual exposition and the supplementary drawings. Part I of the book was first published in 1936 Part II is here published for the first time. The jacket quotes Albert Einstein as follows "The book is a clear and vivid exposition of the essential ideas and methods of the theory of relativity and can be warmly recommended—especially to those who cannot spend too much time on the subject.

QUANTUM MECHANICS

BOHM, DAVID

Quantum theory New York Prentice-Hall Inc. 1951 646 p 24 cm. $8 75 893

Contents (abridged) Part I, Physical formulation of the quantum theory The origin of the quantum theory Wave packets and De Broglie waves. The uncertainty principle. Wave vs. particle properties of matter Part II, Mathematical formulation of the quantum

theory. Wave functions, operators, and Schrödinger's equation. Fluctuations, correlations and eigenfunctions. Part III, Applications to simple systems. Solutions of wave equations for square potentials. The classical limit of quantum theory. The harmonic oscillator. Angular momentum and the three-dimensional wave equation. Matrix formulation of quantum theory. Spin and angular momentum. Part IV. Methods of approximate solution of Schrödinger's equation. Perturbation theory: time-dependent and time-independent. Sudden and adiabatic approximations. Part Theory of scattering. Part VI, Quantum theory of the process of measurement. Relationship between quantum and classical concepts. Index.

Note: A relatively full introduction to the quantum theory for upperclass and graduate students majoring in physics. The author has made special effort to relate the concepts and laws of the quantum theory to classical physics and to the experiments upon which modern physics, particularly the quantum theory, is based. However, though extensive use is made of experimental results in the exposition, the mathematical aspects are not slighted. A short list of supplementary reading is given at the beginning of the book, and there are occasional footnote references throughout the text.

HOUSTON WILLIAM VERMILLION

Principles of quantum mechanics. Nonrelativistic wave mechanics with illustrative applications. New York McGraw Hill Book Company Inc. 1951 288 p. illus. 24 cm. (International series in pure and applied physics G P Harnwell, consulting editor) $6.00 894

Contents (abridged) Part I, General outline of quantum mechanics: Experimental necessity for the quantum theory. Analysis of the inadequacy of classical mechanics. Formulation of quantum mechanics. The classical approximation. Motion of particle in central field. Approximation methods. Spin and the Pauli exclusion principle. Part II, Applications to spectroscopy. Part III, Applications to collision problems. Part IV Applications to electrons in solids. Quantum statistical mechanics. Behavior of an electron gas. Motion of an electron in periodic potential. Part Applications to electromagnetic radiation. Quantization of electromagnetic radiation in empty space. Interaction of radiation and matter. Mathematical appendix. Index.

Note: A comparatively short introduction to quantum mechanics. In addition to the quality of brevity, the exposition tends to be clearer than in some lengthier texts. In the first three chapters, series of actual experiments, the results of which illustrate the inadequacies of classical mechanics, are described, the shortcomings of classical physics are further discussed, and two basic postulates of quantum mechanics, one for representing the state of system, the other for representing change in system when presented. Most of the remainder of the book is devoted to applications of these postulates to physical problems and systems. The book is for graduate students of physics who have had an introductory course in mathematical physics.

LANDÉ, ALFRED

Foundations of quantum theory: a study in continuity and symmetry New Haven Yale University Press 1955 106 p. 21 cm. $4.00. 895

Contents: Entropy continuity and quantum structure. Superposition mechanics and symmetry principles. Quantum dynamics. Appendices. References. Index.

Note: An important contribution to physical theory. In it the author, who is Professor of Theoretical Physics in Ohio State University shows that quantum mechanics in its basic concepts and its formalistic rules not dependent on tailored interpretations of experiments on microphysical scale but can be developed as straightforward consequence of elementary physical principles of continuity and symmetry. The book is addressed to readers, such as teachers of physics who are familiar with the concepts and arguments of quantum mechanics.

LANDÉ, ALFRED

Quantum mechanics. New York Pitman Publishing Corporation 1951 307 p. illus. 24 cm. $5.50. 896

Contents: The antinomies of waves and particles. The older quantum theory. De Broglie waves—uncertainty. Elementary wave mechanics. Approximation methods. Matrix mechanics. Noncommutative systems. Transitions in radiation. Spin and Pauli principle's Atomic and molecular spectra. Quantum statistics. The Dirac electron. The quantum theory of radiation. The meson theory of nuclear forces. Retrospect. Bibliography. Index.

Note: An introductory work suitable chiefly for upperclass or graduate college students who are majoring in physics or mathematics. Essentially the author's method is to develop the subject by painstaking analyses of suitable experiments in physics, and to make these analyses in such way that they are related to classical physics with which the student is presumably familiar. Each chapter concludes with summary and lastly there is summary of the entire book. The author is Professor of Physics at Ohio State University

PERSICO ENRICO

Fundamentals of quantum mechanics translated and edited by Georges M Temmer New York Prentice-Hall, Inc. 1950 484 p. illus. 22 cm. $7.50 897

Contents: Part I, Historical development and experimental basis. The atomic model. Energy quanta and light quanta. Energy levels. Quantum mechanics. Part II, Wave mechanics of a particle: Mathematical introduction. Probabilistic statement of atomic problems. One-dimensional problems. Three-dimensional problems. The Bohr-Sommerfeld theory. Part III, General methods of quantum mechanics: Mathematical introduction. General theory of quantum mechanics. The matrix method. Perturbation theory. Relativity and spin. Systems with identical particles. Bibliography. Index.

Note: The first part of this book can be understood by practically anyone who has successfully completed an introductory course in college physics. The second part requires the mathematical knowledge that any college student majoring in physics should have acquired. Although highly abstract mathematical methods have been avoided in the third part, the concepts of matrix theory and Hilbert space are used, hence fairly high level of mathematical education is required to read it. The book can be used either as college textbook or as an introduction for persons out of college who have had the requisite training in basic physics and mathematics.

REICHENBACH HANS

Philosophic foundations of quantum mechanics. Berkeley University of California Press, 1944 182 p. illus. 24 cm. $4.00. 898

Contents (abridged) Part I, General considerations. Causal laws and probability laws. Probability distributions. The principle of indeterminacy. The disturbance of the object by the observation. Waves and corpuscles. Exhaustive and restrictive interpretations. Part II, Outlines of the mathematics of quantum mechanics: Expansion of function in terms of an orthogonal set. Geometrical interpretation in the function space. Functions of several variables and the configuration space. Operators, eigen-functions, and eigen-values of physical entities. The commutation rule. Operator matrices. Mathematical theory of measurement. The rules of probability and the disturbance by the measurement. The nature of probabilities and of statistical assemblages in quantum mechanics. Part III, Interpretations: Comparison of classical and quantum mechanical statistics. The corpuscle interpretation. The impossibility of chain structure. The wave interpretation. The rules of two-valued logic. The rules of three-valued logic. The limitation of meaningfulness. Conclusion. Index.

Note: The author of this advanced treatment has endeavored to develop philosophic interpretation free from metaphysics, and to develop it in such way that quantum mechanical results about the world can be considered as real as the physical world. He interprets philosophy as the analysis of the knowledge of the physical world.

SCHIFF LEONARD I.

Quantum mechanics. Second edition. New York McGraw Hill Book Company, Inc., 1956 417 p. illus. 24 cm. (International series in pure and applied physics Leonard I. Schiff consulting editor) $7.00 899

Contents: The physical basis of quantum mechanics. The Schrödinger wave equation. Eigenfunctions and eigenvalues. Discrete eigenvalues—energy levels. Continuous eigenvalues—collision theory. Matrix formulation of quantum mechanics. Approximation

RELATIVITY

ABRO, A D'

The evolution of scientific thought from Newton to Einstein. Second edition revised and enlarged New York Dover Publications, Inc. 1950 481 p illus 21 cm. $2 00 888

Contents Part I, Pre-relativity physics Manifolds. The birth of metrical geometry Riemann's discoveries and congruence. The problem of physical space. An alternative view of non-Euclidean geometries. The first edition was published in 1927 In the second edition, errors were corrected, and the chapter entitled "The finiteness of the universe" was revised and slightly extended.

BERGMANN, PETER GABRIEL

Introduction to the theory of relativity Foreword by Albert Einstein. New York Prentice-Hall, Inc. 1942 287 p 23 cm. (Prentice-Hall physics series) $5 25 889

Contents Part I, *The special theory of relativity:* Frames of reference, coordinate systems and coordinate transformations. Classical mechanics. The propagation of light. The Lorentz transformation. Vector and tensor calculus in an dimensional continuum. *Relativistic mechanics of mass points. Relativistic electrodynamics.* The mechanics of continuous matter Applications of the special theory of relativity Part II, The general theory of relativity The principle of equivalence. The Riemann-Christoffel curvature tensor *The field equations of the general theory of relativity* Rigorous solutions of the field equations of the general theory of relativity The experimental tests of the general theory of relativity The equations of motion in the general theory of relativity Part III, *Unified field theories. Weyl's gauge-invariant geometry* Kaluza's five dimensional theory and the projective field theories. A generalization of Kaluza theory Index.

Note The theory of relativity is presented as theory in physics rather than in *pure mathematics. Only* physicist's knowledge of mathematics is necessary to understand this text. The specific apparatus needed in relativity—tensor calculus and Ricci calculus—is developed in the book itself. Problems are introduced which *familiarize the reader with the mathematical* apparatus and illustrate the physical aspects of the theory The book is divided into the topics of the special theory of relativity the general theory of relativity and the unified field theories.

COLEMAN, JAMES A.

Relativity for the layman a simplified account of the history, theory, and proofs of relativity Illustrated by the author New York The William Frederick Press, 1954 131 p illus 21 cm $2 75 890

Contents The velocity of light. The great dilemma. The special theory of relativity Experimental proof of the special theory The general theory and experimental proof. Relativity and the nature of the universe. The unified field theory Index.

Note Relativity is not an easy field of science to explain to readers who lack education in mathematics. The author of this book, which is addressed to readers who has very little facility in mathematics has, however succeeded fairly well. He has used many analogies in explaining such concepts as the principle of equivalence. On the other hand, he has not avoided mathematics altogether. The basic equations are quoted, and their meanings are described as well as possible in nonmathematical terms. The discussions of the experimental proofs of the Special theory and the General theory add considerable interest to the book.

EINSTEIN, ALBERT

The meaning of relativity Fifth edition, including the *Relativistic theory of the non-symmetric field* Princeton Princeton University Press, 1955 169 p 21 cm. $3 75 891

Contents Space and time in pre-relativity physics. The theory of special relativity The general theory of relativity Appendix. Relativistic theory of the non-symmetric field. Index.

Note This authoritative interpretation of relativity is too well known to require description at this date. The first edition appeared in 1922 The second edition appeared in 1945 and contained an appendix on advances in the theory of relativity which had taken place since the writing of the first edition in 1921 The third edition published in 1950 contained a second appendix in which Einstein stated his generalized theory of gravitation. In this fifth and final edition that second appendix has been replaced with one entitled "Relativistic theory of the non-symmetric field, in which *Einstein restated the generalized theory with the object of simplifying* the derivations and making the theory more clear.

LIEBER, LILLIAN ROSANOFF

The Einstein theory of relativity Drawings by Hugh Gray Lieber New York Rinehart & Company, Inc., *1945 324* p illus *21* cm. $3.50 892

Contents (abridged) Part I, The special theory The Michelson-Morley experiment. Re-examination of the fundamental ideas. The remedy The result of applying the remedy The four-dimensional space-time continuum. Some consequences of the theory of relativity Part II, The general theory The principle of equivalence. A non-Euclidean world! The study of spaces. What is tensor? The effect on tensors of a change in the coordinate system. Mixed tensors. Contraction and differentiation. The little g's. The curvature tensor at last. The big G's or Einstein's law of gravitation. Comparison of Einstein's law of gravitation with Newton's. How can the Einstein law of gravitation be tested? More about the path of planet. The perihelion of Mercury Deflection of a ray of light. The third of the "crucial" phenomena. Summary

Note: The purpose of this book is to fill the need for presentation between the popular and the expert levels of the Einstein theory of relativity The authors have written several other books in which difficult mathematical concepts have been explained for general readers, and they have developed original techniques for both the textual exposition and the supplementary drawings Part of the book was first published in 1936 Part II is here published for the first time. The jacket quotes Albert Einstein as follows "The book is clear and vivid exposition of the essential ideas and methods in the theory of relativity and can be warmly recommended—especially to those who cannot spend too much time on the subject.

QUANTUM MECHANICS

BOHM, DAVID

Quantum theory New York Prentice Hall Inc. 1951 646 p 24 cm. $8 75 893

Contents (abridged) Part I, Physical formulation of the quantum theory The origin of the quantum theory Wave packets and De Broglie waves. The uncertainty principle. Wave vs. particle properties of matter. Part II, *Mathematical formulation of the quantum*

HILL, TERRELL L.

Statistical mechanics principles and selected applications. New York McGraw Hill Book Company Inc., 1956. 432 p. illus. 24 cm. $9.00. 905

Contents: Principles of classical statistical mechanics. Principles of quantum statistical mechanics. Statistical mechanics and thermodynamics. Fluctuations. Theory of imperfect gases and condensation. Distribution functions and the theory of the liquid state. Nearest-neighbor lattice statistics. Lattice theories of the liquid and solid states. Appendixes. Index.

Note: Rather than attempting to provide [illegible] comprehensive treatise, the author of this book has selected certain important recent developments in statistical mechanics and has dealt with them at length. His chapter on "Distribution functions and the theory of the liquid state," for example, is 113 pages long and is essentially complete account of the present state of this aspect of statistical mechanics. Several of the other chapters also are full-scale treatments of the topics named in their titles. The exceptions are the first, second, and third chapters which are compact treatment of basic principles, included for background. The book is addressed to such readers as graduate students and young graduate scientists studying or doing research work in chemistry and physics. It is of interest also to established scientists who are familiar with classical statistical mechanics and wish to become familiar with recent work in the field.

SLATER, JOHN CLARKE

Introduction to chemical physics. New York McGraw Hill Book Company Inc., 1939 521 p. illus. 23 cm. (International series in physics F. K. Richtmyer consulting editor) $5.00. 906

Contents (abridged): Part I, Thermodynamics, statistical mechanics, and kinetic theory. Heat as [illegible] mode of motion. Statistical mechanics. The Maxwell-Boltzmann distribution law. The Fermi-Dirac and Einstein-Bose statistics. The kinetic method and the approach to thermal equilibrium. Part II, Gases, liquids, and solids: Thermodynamic and statistical treatment of the perfect gas and mixtures of gases. The molecular structure and specific heat of polyatomic gases. Chemical equilibrium in gases. The equilibrium of solids, liquids, and gases. The equation of state of solids. Debye's theory of specific heats. Phase equilibrium in binary systems. Phase changes of the second order. Part III, Atoms, molecules, and the structure of matter. Radiation and matter. Ionization and excitation of atoms. Interatomic and intermolecular forces. The homopolar bond and molecular compounds. Organic molecules and their crystals. Homopolar bonds in the silicates. Thermionic emission and the volta effect. The electronic structure of metals.

Note: In the unified presentation of material common to the fields of physics and chemistry the author offers [illegible] treatment of thermodynamics and statistical mechanics, including their applications to solids, liquids, and gases. There is also [illegible] discussion of atomic structure and the resulting interatomic and intermolecular forces, with application to the different types of chemical substances, and to their thermal and mechanical properties.

PHYSICS OF GASES

BASS, A. M. editor

Energy transfer in hot gases. Proceedings of the NBS Semicentennial Symposium on Energy Transfer in Hot Gases held at the NBS on September 17 and 18 1951 Washington, D. C. Government Printing Office, 1954 126 p. illus. 24 cm. (United States. National Bureau of Standards. Circular 523) $1.50. 907

Contents: Processes of electronic excitation in relation to flame spectra, by A. G. Gaydon. Profiles of some polyatomic flame bands, by G. A. Hornbeck and R. C. Herman. Emission spectra of polyatomic free radicals, by F. J. Dyne. Distributions of OH rotational intensities in flames, by H. P. Broida. Spectroscopic studies of low-pressure combustion flames, by R. E. Ferguson and others. Studies of emission and absorption in flames, by G. H. Dieke and H. M. Crosswhite. Energy distribution of CO molecules in CO-O_2 flames, by S. Silverman. High-resolution spectra of hydrocarbon flames in the infrared, by W. S. Benedict and E. K. Plyler. Infrared emissivity of diatomic gases, by S. S. Penner. Infrared spectra of thermally excited gases, by R. H. Tourin. Present position of the theory of flames, by B. Lewis. Detailed mechanism of elementary reactions: production of OH ($^2\Sigma^+$) in the H_2-O_2 flame, by K. E. Shuler. Some reactions of atomic hydrogen in flames, by J. R. Arthur and D. T. A. Townend. Temperature of the hydrogen-fluorine flame, by R. H. Wilson, Jr. and others. Effect of flame-generated turbulence on heat transfer from combustion gases, by B. Karlovitz. Astrophysicist's concept of temperature, by H. K. Sen.

Note: Interest in the problems of radiation from flames and hot gases and of basic chemical and physical mechanisms governing energy transfer in these media led to the holding of the Symposium on Energy Transfer in Hot Gases under the auspices of the National Bureau of Standards, with the co-operation of the Office of Naval Research. This volume, in which the symposium papers are published, is of interest to chemical technologists who are concerned with the practical as well as the theoretical aspects of the production and utilization of high temperatures. Bibliographical references are included at the close of the respective papers.

HILSENRATH, JOSEPH, AND OTHERS

Tables of thermal properties of gases, comprising tables of thermodynamic and transport properties of air, argon, carbon dioxide, carbon monoxide, hydrogen, nitrogen, oxygen, and steam. By Joseph Hilsenrath, Charles W. Beckett, William S. Benedict, Lilla Fano, Harold J. Hoge, Joseph F. Masi, Ralph L. Nuttall, Yeram S. Touloukian, and Harold W. Woolley. Washington, D. C. Government Printing Office, 1955 488 p. illus. 27 cm. (United States. National Bureau of Standards. Circular 564) $3.75 908

Contents: Introduction. The thermodynamic properties of air. The thermodynamic properties of argon. The thermodynamic properties of carbon dioxide. The thermodynamic properties of carbon monoxide. The thermodynamic properties of hydrogen. The thermodynamic properties of nitrogen. The thermodynamic properties of oxygen. The thermodynamic properties of steam. Appendix.

Note: The importance of basic thermodynamic and transport data for air and its constituent gases in the conduct of aerodynamic research has long been recognized and led to the compilation beginning in 1948 and to the publication seven years later of the tables in this Circular. Data are given at close temperature intervals for the thermodynamic properties and transport properties of air and of its component gases: argon, carbon dioxide, carbon monoxide, hydrogen, nitrogen, oxygen, and steam. "The thermodynamic properties—compressibility factor, density, entropy, enthalpy, specific heat, specific-heat ratio, and sound velocity—are tabulated for the real gas at pressures up to 100 atmospheres and to temperatures of 600°K for hydrogen, 1500°K for carbon dioxide, 850°K for steam, and 3000°K for the remainder. The ideal-gas thermodynamic functions are tabulated uniformly to 5000°K. Also tabulated are the vapor pressures and transport properties—thermal conductivity, viscosity, and Prandtl number. These were fitted either semi-theoretically or empirically to the experimental values and are tabulated over the range of the available experimental data. Comparisons of the tabulated values with the existing experimental data are shown in deviation plots which exhibit the range and distribution of the experimental data as well as their agreement with the tabulated values. Each set of tables is provided with its own introductory textual data. References consulted in the course of the work are listed.

KENNARD, EARLE HESSE

Kinetic theory of gases, with an introduction to statistical mechanics. New York McGraw Hill Book Company Inc., 1938. 483 p. illus. 23 cm. (International series in physics F. K. Richtmyer consulting editor) $8.00. 909

Contents: Elements of the kinetic theory of gases. Distribution law for molecular velocities. General motion and special dis-

methods for stationary problems. Approximation methods for time-dependent problems. Identical particles and spin. Semiclassical treatment of radiation. Atoms, molecules, and atomic nuclei. Relativistic wave equations. The quantization of wave fields. Quantum electrodynamics. Index.

Note A graduate-level textbook which provides an introduction to quantum mechanics for students who are preparing for professional work in physics. I the first chapter the author outlines experimental evidence on which quantum mechanics is based, criticizes the old quantum theory developed by Planck, Einstein, and Debye and shows how quantum mechanics avoids the difficulty of the old theory The remainder of the book is devoted to the mathematical theories and techniques of quantum mechanics, and here the exposition is full and is supplemented by numerous worked examples. Although the author did not aim at mathematical rigor he has used differential equations and other advanced mathematics freely in the presentation. Physical terms also are frequently used. The last three chapters are written at a more advanced level than those that precede them. The first edition was published in 1949 A number of changes in the expository text and in the problems were made for this second edition, but there has not been an extensive revision of the book.

SLATER, JOHN CLARKE

Quantum theory of matter New York McGraw Hill Book Company, Inc., 1951 528 p illus 24 cm. (International series in pure and applied physics, G P Harnwell, consulting editor) $7 50 900

Contents De Broglie waves and wave mechanics. Schrödinger's equation Average values and matrices. Perturbations and the action of radiation. The hydrogen atom The central field model for atomic structure. Multiplet structure. The hydrogen molecule. Interatomic and intermolecular forces. The metallic state. Mechanical, chemical, and thermal properties of matter Electrical conductivity The nature of dielectrics. Magnetism. Appendixes. Suggested references. Index.

Note An introductory treatment of the quantum theory as it relates to the structure of atoms, molecules, and solids. One or two courses in basic mathematics at the college level on the part of the reader has been assumed. Most of the discussion is in narrative form rather than in mathematical equations The book is addressed to advanced undergraduate and graduate students of chemistry metallurgy and physics. It takes the place of the section on quantum mechanics in *Introduction to theoretical physics*, New York, 1933 by Slater and N H. Frank, and forms a part (though it can be read independently) of the expansion of that work into four volumes consisting of the present work and three others bearing the titles *Mechanics*, by Slater and Frank *Electromagnetism* by Slater and Frank, and *I troduction to chemical physics* by Slater alone.

VON NEUMANN, JOHN

Mathematical foundations of quantum mechanics translated from the German edition by Robert T Beyer Princeton Princeton University Press 1955 445 p 23 cm. (Investigations in physics edited by Eugene Wigner and Robert Hofstadter) $6 00 901

Contents Introductory considerations. Abstract Hilbert space. The quantum statistics. Deductive development of the theory General considerations. The measuring process.

Note The German original I this work was published in Berlin in 1932 before the uthor migrated to the United States of America. Since publication, it has been recognized as one of the basic works on quantum mechanics. The translation was revised by the uthor but no extensive changes from the original text were made. The notes, which in the original edition were printed at the end of the volume, are in this version printed as footnotes and are of course translated.

STATISTICAL MECHANICS

BAND WILLIAM

An introduction to quantum statistics. Princeton D Van Nostrand Company Inc. 1955 342 p illus 23 cm $7 50 902

Contents. Review of quantum mechanics. The formation of statistical mechanics. Statistical interpretation of thermodynamics. The partition function in classical statistics. Equilibrium between phases. Chemical and dissociative equilibrium. Assemblies of dependent systems. Independent systems with quantum degeneracy Phase equilibria among quantum degenerate systems. Dissociative equilibrium among quantum degenerate systems. Quantum degenerate assemblies of dependent systems. The grand partition function and its applications. General theory of the liquid phase. Some solid state problems. Fluctuations and nonequilibrium phenomena. Appendix. Index.

Note An exposition of statistical mechanics which is addressed to chemists and physicists rather than to mathematicians. It is written at the graduate level and is designed primarily for use as a text in graduat courses. Although the first chapter is devoted to a review of quantum mechanics, the treatment assumes that the reader will have had a course in this subject or be pursuing one. Theory and thinking in terms of theory are emphasized further more, the statistical approach is favored over the thermodynamic. On this point the author has stated "Each practical problem is studied as a problem in statistics. The basic methods of statistics are applied repeatedly in whatever form the particular problem demands, and appeal is seldom made to general thermodynamic laws to show the derivation. The author is Professor of Physics in Washington State College.

DOLE, MALCOLM

Introduction to statistical thermodynamics. Englewood Cliffs, N J Prentice-Hall, Inc., 1954 250 p illus. 21 cm (Prentice-Hall chemistry series, Wendell M Latimer, editor) $6 25 903

Contents Introduction. Introduction to mathematical probability Distribution of molecular weights in linear condensation polymers. Fundamentals of statistical mechanics—probability equation of the most probable state. Derivation and significance of the Boltzmann distribution law Interionic attraction theory of strong electrolytes. Relation of thermodynamic functions to the partition function. Preliminary considerations and evaluation of the partition function. Evaluation of translational rotational, and vibrational partition functions for perfect gases. Heat capacity of gases and solids. Calculation of equilibrium constants in terms of partition functions. Entropy of chemical substances. Statistical thermodynamics of adsorption. Bose-Einstein and Fermi-Dirac statistics. Appendix. Index.

Note: The author of this book is a chemist by profession, but the book is directed both to students of chemistry and to students of physics. The level of treatment does not assume a previous course in statistical mechanics, although some notions of statistical mechanics are introduced. The primary emphasis is on relating the theoretical knowledge of thermodynamics and kinetics to practical chemistry and physics. Numerous illustrations of applications are mentioned.

GURNEY, RONALD WILFRID

Introduction to statistical mechanics. New York McGraw Hill Book Company Inc., 1949 268 p illus. 24 cm. (International series in pure and applied physics G P Harnwell, consulting editor) $6 00 904

Contents (abridged) Groups of particles. The use of undetermined multipliers. The distribution of particles through alternative sets of energy levels. The partition function and properties of monatomic and diatomic gases. The relation between statistical mechanics and thermodynamics. Conditions of equilibrium for a partially dissociated diatomic gas. Substitutional and interstitial solutions. The total energy shared by interacting particles. Chemical mechanics. Vibration of molecules and of crystal lattices. The rotation of diatomic molecules. Particles in electric and magnetic fields. Appendix. Name index. Subject index.

Note An attempt to simplify the exposition of statistical mechanics so that its chief concepts and methods will be available to scientists who are not professional mathematicians. The more abstract concepts are not introduced until the latter part of the book. In the first part the emphasis is on the mathematical techniques and some of their applications. Applications in chemistry and in physics are used throughout the book. The chapters are supplemented by problems for students to solve, but the work is intended for graduat students and graduat scientists already in industry rather than for undergraduates.

CARLIN BENSON

Ultrasonics. New York McGraw Hill Book Company Inc., 1949 270 p. illus. 24 cm. $5.50 915

Contents: Ultrasonic waves. Ultrasonic waves: further theory. Crystals for ultrasonic use. Crystal holders for ultrasonic use. Resonance and selection. Continuous-wave ultrasonic systems. Pulsed ultrasonic systems. Ultrasonic agitation. Magnetostriction. Practical considerations in the application of ultrasonics. Index.

Note: A survey of the basic phenomena of radiation in the "ultrasonic range and of some of the applications. The author has done extensive experimentation in the field himself and the book incorporates results of his own work as well as the published results of others. It is especially useful for its descriptions of fundamental apparatus such as crystal holders and basic circuits. The book is suitable as an introduction for such readers as scientists seeking information outside the field of their own specialties. Also, it can be read by laymen who have an acquaintance with basic electronic terminology.

GEOLOGICAL SOCIETY OF AMERICA

Propagation of sound in the ocean Explosion sounds in shallow water by J Lamar Worzel and Maurice Ewing Theory of propagation of explosive sound in shallow water by C. L. Pekeris Long range sound transmission, by Maurice Ewing and J Lamar Worzel. Contribution no. 415 from the Woods Hole Oceanographic Institution. New York The Geological Society of America, 1948. 53 117, 35 p. illus. 25 cm. (The Geological Society of America. Memoir 27) $2 75 916

Contents: Explosion sounds in shallow water: Recording system characteristics. Calibrations. Calibration reductions. Shot list. Water waves. Bubble pulses. Ground waves. Refraction results. Conclusions. References cited. Index.—Theory of propagation of explosive sound in shallow water. Part I, Data: Some observed characteristics of pressure records obtained at large ranges from an explosion in shallow water. Qualitative discussion of the theory of propagation of explosive sound in shallow water. Summary of the solutions of the wave equation for the problem of propagation of sound produced by point-source explosions in shallow water. Propagation of pressure pulse in shallow water. Features of the pressure wave from an explosion in shallow water. Some remarks on the history of the development of the theory of normal modes in elastic half-spaces and of its applications to problems of propagation of shocks. Preliminary report on free acoustic waves, prepared in November 1941. Part II, Theory: Theory of propagation of sound in water underlain by uniform bottoms of different density and sound velocity. Theory of propagation of sound in three-layered liquid half-space. References cited. Index.—Long-range sound transmission: Hydrographic data. Key diagram calculation. Travel times. Calibration and frequency response. Peak intensities. Sound energies. Conclusions. Appendices: Calculation of travel time along sound ray. Shot list. References cited. Index.

Note: These papers are based on a series of experiments that were carried out under contracts between the Woods Hole Oceanographic Institution and several agencies of the United States Government.

HUETER, THEODOR F., AND RICHARD H. BOLT

Sonics techniques for the use of sound and ultrasound in engineering and science. New York John Wiley and Sons, Inc., 1955 456 p illus. 23 cm. $10.00. 917

Contents: Introduction. Basic principles. Radiation. Piezoelectric transducers. Magnetostrictive transducers. Physical mechanisms for sonic processing. Devices and techniques for sonic processing. Principles of sonic testing and analysis. Appendix. Acoustical relaxation mechanisms in fluids: General relations between macroscopic and microscopic properties. Phase lag between pressure and density. Classical absorption and velocity dispersion. Molecular relaxation in gases. Structural aspects of sound propagation in liquids. Sound propagation in fluid mixtures and solutions. Author index. Subject index.

Note: A text and reference book addressed to graduate engineers who wish to understand the applications, developed and potential, of radiation in the ranges of audible sound and supersonic frequencies. Although the slant is practical, the emphasis is on principles and other fundamental matters in the design of systems. Elements which are common to all systems, such as transducers, are thoroughly explored as to principles, properties and mechanical details, but there are no descriptions of specific applications in industrial plants.

KINSLER, LAWRENCE E., AND AUSTIN R. FREY

Fundamentals of acoustics New York John Wiley & Sons Inc., 1950 516 p illus. 20 cm. $6.50. 917A

Contents: Simple harmonic motion. Vibrating strings. Vibrations of bars. Circular membranes and plates. Acoustic plane waves. Transmission phenomena. Spherical acoustic waves. Resonators and filters. Absorption of sound waves. Direct radiator loudspeakers. Horn-type loudspeakers. Microphones. Psychoacoustics. Architectural acoustics. Underwater acoustics. Ultrasonics. Appendix. Glossary of symbols. Index.

Note: Fundamental principles and phenomena are emphasized in this engineering college textbook. In addition, the reader is introduced to the fundamental theorems and constants, and to practical methods of analysis of acoustical problems. The principles and characteristics of standard acoustical devices, such as microphones, also are discussed, but there is no attempt to cover the whole field of acoustical devices or applications.

THERMODYNAMICS AND HEAT

AMERICAN INSTITUTE OF PHYSICS

Temperature, its measurement and control in science and industry papers presented at a symposium held in New York City November 1939 under the auspices of the American Institute of Physics with the cooperation of National Bureau of Standards, National Research Council, and officers and committees of American Ceramic Society American Chemical Society American Institute of Mining and Metallurgical Engineers, [and others] New York Reinhold Publishing Corporation, 1941 1,362 p. illus. 23 cm. $18.00 918

Contents: Temperature and temperature scales. Precision thermometry. Education. Natural sciences. Temperature in biology. Temperature and its regulation in man. Automatic temperature regulation and recording. Special applications and methods. General engineering. Metals and ceramic industries. Oil industries. Optical and radiation pyrometry. Thermoelectric metals and alloys. Glossary. Index.

—— Volume II. Edited by Hugh C. Wolfe. Papers presented at the Third Symposium on Temperature, Washington, D C., October 28–30 1954 Sponsored by American Institute of Physics, National Bureau of Standards, Office of Ordnance Research, U S. Army New York Reinhold Publishing Corporation, 1955 467 p. illus. 23 cm. $12.00. 919

Contents: Section I, General concepts: The temperature concept, by H. C. Wolfe. The concept of temperature near absolute zero, by F. E. Simon. High gas temperatures, by G. H. Dieke. Astrophysical temperatures, by C. Payne-Gaposchkin. Section II, Standards and scales: Gas thermometry, by J. A. Beattie. Thermodynamic temperatures obtained from P V isotherms of He gas between 1° and °K, by W. E. Keller. High temperature gas

tribution of the molecules. Viscosity thermal conduction, diffusion. The equation of state. Energy entropy and specific heats. Fluctuations. Properties of gases at low densities. Statistical mechanics. Wave mechanics of gases. Electric and magnetic properties of gases. Some integrals. Important constants. Index.

Note An introduction to the kinetic theory of gases. Included are an account of the wave-mechanical theory and especially of the degenerate Fermi-Dirac case. A concise chapter of general statistical mechanics is provided, and a number of carefully worded theorems have been inserted in the guise of problems.

LADENBURG, R W, AND OTHERS, *editors*

Physical measurements in gas dynamics and combustion Princeton Princeton University Press, 1954 578 p illus. 25 cm. (High speed aerodynamics and jet propulsion Board of editors Theodore von Kármán, chairman, Hugh L Dryden and others) $12 50 910

Contents Part I, Physical measurements in gas dynamics, editor R. Ladenburg Density measurements—Analysis of optical methods, by F J Weyl—Shadow and Schlieren methods, by J W Beams—Interferometry by R. Ladenburg and D Bershader—Electrical discharge and afterglow technique by E. M. Winkler—Spectral absorption method, by E. M. Winkler—X-ray technique, by E. M Winkler Pressure measurements—The impact tube, by P L. Chambré and S. A. Schaaf—Pressure measuring manometers and gauges, by W Bleakney and A. B. Arons. Velocity measurements—Velocity measurements using ions as tracers, by W M. Cady—Velocity measurements by illuminated or luminous particles, by W M. Cady—Electric discharge anemometry by W M. Cady—Acoustic Mach meters, by W C. Cady—Velocity of shock waves by the light screen technique, by W Bleakney Temperature measurements—Wall temperature determination, by G. R. Eber—Shielded thermocouples, by G. R. Eber—Temperature measurement by sound velocity methods, by W M Cady Shock front measurements by light reflectivity by D F Hornig. Turbulence measurements, by L. S. G. Kovásznay Condensation study by absorption or scattering of light, by E. M. Winkler Analogue methods—Free surface water table, by A. H. Shapiro—Electrolytic plotting tank, by L. Malavard. Part II, Physical measurements in combustion edited by H. S. Taylor and others Measurement of flame temperature, pressure, and velocity by F P Bundy and H. M. Strong Flame photography by W T Reid. Measurement of burning velocity, by E. F Fiock. Mass spectroscopy by J A. Hipple—Methods of mass analysis—Application to chemical analysis—Applications to flames. Spectroscopy of combustion, by G. H. Dieke. Analysis of the combustion wave by pressure effects and spectroscopy by N Thomas. Index.

Note Part of projected twelve-volume series, this book is critical survey f techniques applicable t the measurement of density pressure, etc., gases in turbulence and gases undergoing combustion. Each technique is described explicitly and mathematical equations and computations used in interpreting results obtained by means of it are illustrated. Literature references are generally included. Apparatus set-ups and sections of instruments are shown. The treatment is on graduate level, and the book will be of interest to physicists and engineers concerned with research in combustion and aerodynamics.

PATTERSON, G N

Molecular flow of gases New York John Wiley & Sons Inc. 1956 217 p 24 cm. $7 50 911

Contents. The fundamental equations. Isentropic flow Basic equations for nonisentropic flow Nonisentropic flows. Mechanics of rarefied gases. Appendix. Index.

Note The need to design aircraft, rockets, and guided missiles (not to mention space ships) for flight in rarefied atmospheres undoubtedly was motive for the writing of this book. In it the flow of gases is studied in terms of discrete molecules rather than as continuum. The treatment is classical in the sense that it is based on the classical laws of conservation of momentum and energy The book is addressed to advanced graduat students of physics and of aeronautical engineering. It should be of equal interest to engineers and physicists already t work in industrial research and design in fields where an understanding of the molecular flow f gases is important Extensive lists f references to the literature is included in the chapters. The author is director of the Institute of Aerophysics and chairman of the Department of Aerophysics of the University of Toronto.

SPITZER, LYMAN, JR

Physics of fully ionized gases. New York Interscience Publishers, Inc., 1956 105 p. illus. 21 cm (Interscience tracts on physics and astronomy, edited by R. E Marshak) $3 50 912

Contents Motion of a particle. Macroscopic motion—principles—problems. Waves in a plasma. Encounters between charged particles. Appendix The Boltzmann equation. Symbols. Index.

Note. An introduction intended for graduate students of physics and other readers who have a general knowledge of theoretical physics. It deals with fundamental aspects of the analysis of fully ionized gases and serves as an introduction to the more advanced literature on this subject. The author is member of the staff of the Princeton University Observatory

SOUND

BERANEK, LEO LEROY

Acoustic measurements Prepared under the auspices of the Office of Naval Research Navy Department, Washington D C. New York John Wiley & Sons, Inc., 1949 914 p. illus 22 cm. $12 50 913

Contents Introduction and terminology The medium. Disturbance of plane sound waves by obstacles and by finite baffles. Primary techniques for the measurement of sound pressure and particle velocity and for the absolut calibration of microphones. Microphones and ears. Measurement of frequency Measurement of acoustic impedance. The velometer Sound sources for test purposes. Characteristics f random noise the response f rectifiers to random noise and complex waves. Indicating and integrating instruments for the measurements of complex waves. Analysis of sound waves. Basic tests for communication systems, the rating of microphones, amplifiers, and loudspeakers. Tests for laboratory and studio microphones. Tests for loudspeakers. Testing of communication system components. Articulation test methods. Measurement of the acoustic properties of rooms, studios, and auditoriums. Measurement of acoustical materials. The sound level meter Author Index. Subject Index.

Note. A comprehensive reference book written on the graduate-professional level. It is designed as an aid "to five main groups of research workers, the acoustic physicist making fundamental laboratory measurements, the communications engineer measuring and evaluating the performance of wide communications systems, the psychologist performing measurements involving the human hearing mechanism, the otologist studying hearing defects and, finally the industrialist applying acoustic measuring techniques in manufacturing processes.

BERANEK, LEO LEROY

Acoustics. New York McGraw Hill Book Company Inc. 1954 481 p illus 24 cm (McGraw Hill *electrical and electronic engineering series* Frederick E Terman consulting editor) $10 00 914

Contents I troduction and terminology *The wave equation and solutions*. Electro-mechano-acoustical circuits. Radiation of sound. Acoustic components. Microphones. Direct-radiator loudspeakers. Loudspeaker enclosures. Horn loudspeakers. Sound in enclosures. Noise control. Acoustic measurements. Hearing, speech intelligibility and psychoacoustic criteria. Problems. Appendixes. Index.

Note A textbook developed at Massachusetts Institute of Technology where the author is Associate Professor of Communication Engineering It is introductory to the field of acoustics, but the level f treatment assumes that the reader will have had considerable basic education in physics and the usual undergraduate courses in mathematics. The practical slant is not indicated by the chapter titles. However the book is judicious combination of theory and mathematical analysis applied to the practical problems *of acoustics engineering. There is considerable emphasis on electrical-*acoustical design problems, but the reader is at least introduced to other *fields of acoustical engineering*, such as noise control and architectural acoustics. There is also useful information for the technically educated designer of systems for the high-fidelity reproduction of sound.

soil. Revised edition. Madison University of Wisconsin Press 1954 325 p illus. 23 cm. $5.00 926

Contents: Introduction. The Fourier conduction equation. Steady state—one dimension. Steady state—more than one dimension. Periodic flow of heat in one dimension. Fourier series. Linear flow of heat. Flow of heat in more than one dimension. Formation of ice. Auxiliary methods of treating heat-conduction problems. Methods of measuring thermal-conductivity constants. Theory of earth heat exchangers for the heat pump. Drying, soil consolidation. Appendixes. Index.

Note: Mathematical methods applicable to complex problems in heat conduction, such as the working out of geological time-tables, heat flow in the vulcanization of tires, cooling of gas turbines, and heat sources for heat pumps are treated in this textbook. The book is aimed at readers who will make practical use of the knowledge; hence, the emphasis is on practical rather than refined methods of attack. It has been assumed that the reader will have a knowledge of fundamental physics and calculus. The preceding edition was issued by another publisher in 1943. In this revised edition—actually the third edition of the work—the two chapters at the end are newly added. One of these contains a much expanded treatment of the problems of the earth as a source of heat for heat pumps used in air conditioning. Presented in the 13 appendixes is a variety of reference information, such as values of thermal conductivity constants, tabulations of functions and definite integrals, and a bibliography of 220 literature references.

JESSUP RALPH SLOCOMB AND ELMER R. WEAVER

Gas calorimeter tables. Third edition. Washington D C. Government Printing Office 1948 42 p. illus. 23 cm. (United States. National Bureau of Standards. Circular 464) $0.15 927

Contents: Introduction. Summarized operating directions for water-flow gas calorimeters. Tables and charts. Corrections for humidity, specific heat of water, buoyancy, and heat loss. Preparation of correction table for local use. Corrections for difference between inlet-water and room temperatures. Correction of heating value to basis of measurement for sale. Records and computations.

Note: This publication, which supplements National Bureau of Standards Circular 48, *Standard methods of gas testing*, contains condensed directions for operating a gas calorimeter of the water-flow ("Junkers") type, with forms and directions for recording and computing results, tables of "reduction factors" for gas volumes between 32 and 110°F and from 24 to 30.9 in. of mercury pressure, and tables of correction factors needed in fuel-gas calorimetry. Blank forms are included to be filled in with data pertaining to local conditions and individual laboratory instruments, so that the user may have all the data needed in gas calorimetry conveniently arranged under one cover. This supersedes Circular 417.

POWELL ROBERT L. AND WILLIAM A. BLANPIED

Thermal conductivity of metals and alloys at low temperatures a review of the literature. Washington D C. Government Printing Office 1954 68 p illus. 26 cm. (United States. National Bureau of Standards. Circular 556) $0.50 928

Contents: Introduction. Figures and tables list. Metallic elements. Alloys and commercial metals. Dielectric crystals. Bibliography.

Note: In this circular the thermal conductivity values of three types of solid are presented in graphic and tabular form: metallic elements, alloys, and dielectrics. The professional abstract and leading research journals were searched for references dating from 1900 to the spring of 1954. The compilation is complete for the metals and essentially complete for the alloys, but only a few representative references are given for the dielectrics. Conductivity values are reported for the temperature range approximately 0° to 300°K. Although the circular is not primarily a critical compilation, the text indicates a method that may be used in choosing between conflicting data. Information on the thermal conductivity of materials of construction at low temperatures is essential in the design of cryogenic equipment. Such data on pure metals also have important applications in basic physics.

ROSSINI FREDERICK D editor

Thermodynamics and physics of matter Princeton Princeton University Press, 1955 812 p. illus. 24 cm. (High speed aerodynamics and jet propulsion. Vol 1) $15.00 929

Contents (abridged): Fundamentals of thermodynamics, by F. D. Rossini. Fundamental physics of gases, by K. F. Herzfeld and others. Thermodynamic properties of real gases and mixtures of real gases, by J. A. Beattie. The transport properties of gases and gaseous mixtures, by J. O. Hirschfelder and others. Critical phenomena, by O. K. Rice. Properties of liquids and liquid solutions, by J. M. Richardson and S. R. Brinkley, Jr. Properties of solids and solid solutions, by F. P. Bundy. Relaxation phenomena in gases, by K. F. Herzfeld. Gases at low densities, by I. Estermann. The thermodynamics of irreversible processes, by C. F. Curtiss. Index.

Note: A graduate-professional level statement of the fundamental concepts, laws, and equations pertaining to thermodynamics and physics of matter. It is the first volume (though not the first published) in a 12-volume series planned to provide a comprehensive and authoritative treatment of scientific theory and engineering techniques pertaining to high-speed aerodynamics and jet propulsion. However, the contents of this volume are basic to various fields of engineering. Well-selected literature lists are included, and the index is fully detailed.

SEARS FRANCIS WESTON

An introduction to thermodynamics the kinetic theory of gases and statistical mechanics. Second edition. Reading Mass. Addison Wesley Publishing Company Inc., 1953 374 p. illus. 24 cm. $5.50 930

Contents: Thermodynamic systems. Equations of state. Work. The first law of thermodynamics. Some consequences of the first law. Changes of phase. The second law of thermodynamics. Entropy. Combined first and second laws. Some engineering applications of thermodynamics. Kinetic theory of an ideal gas. The distribution of molecular velocities. Transport phenomena. The Maxwell-Boltzmann statistics. Applications of the Boltzmann statistics. Quantum statistics. Fluctuations. Collateral reading. Index. Answers to problems. Selected differentials from a condensed collection of thermodynamic formulas, by P. W. Bridgman.

Note: A college textbook originally written for use in a course given by the author to students of electrical engineering at the Massachusetts Institute of Technology. It is suitable also as an introduction to thermodynamics for students majoring in theoretical physics. The treatment assumes a fair degree of maturity in physical and mathematical thinking. The discussions are clear, rigorous, compact, and are amply supplemented by worked examples and diagrams. The first edition was published in 1950. In preparing the second edition, the former terminal chapter on low-temperature physics was deleted and a new chapter on fluctuations added. Also the chapters dealing with Boltzmann statistics were rewritten.

WEBER, ROBERT L.

Heat and temperature measurement. New York Prentice-Hall, Inc., 1950 422 p. 22 cm. (Prentice-Hall physics series Donald H. Menzel editor) $6.00. 931

Contents (abridged): Part 1, Principles of heat and temperature measurements: Temperature scales. Expansion thermometers. Heat transfer. Thermoelectricity. Radiant energy. Optical and radiation pyrometry. Resistance thermometry. Calorimetry. Phase diagrams, thermal analysis. Thermodynamics. Extreme temperatures. Special methods of temperature measurement. International temperature scale. Part 2, Laboratory experiments. Appendixes: How to solve physical problems. General laboratory procedure. Symbols and quantities. Tables. Index.

Note: An elementary but rather thorough description of basic techniques and equipment applicable to the measurement of temperature and heat flow. Chiefly it is a laboratory manual for the use of college students who have had an introductory course in physics. The discussions of experimental procedures are full enough to make them useful as guides to scientists out of college who need directions for projects involving heat measurement. Enough thermodynamic theory is included to make the book essentially complete in itself. Each chapter includes a selected bibliography. The work is a revision of the author's *Temperature measurement and control*, Philadelphia, 1941.

thermometry by H. Moser The international temperature scale by J A. Hall. Precision resistance thermometry and fixed points, by H. F Stimson. The zinc point as a thermometric fixed point, by H. Preston-Thomas. Low temperature scales from 90 to 5 K, by R. B Scott. The helium vapor-pressure scale of temperature by R. P Hudson. Techniques of magnetic thermometry by H. van Dijk. Section III, Transient phenomena Thermodynamics of irreversible processes and fluctuations, by I Prigogine. Relaxation of partial temperatures, by K. F Herzfeld. Section IV Experimental measurements. Thermometry below 1 K, by D de Klerk. Experimental temperature measurements in flames and hot gases, by H. P Broida. Temperature measurement in engineering, by H. J Hoge. Superconductors as thermometers, by J G. Daunt. Semiconductors as thermometers, by S. A. Friedberg. Sound velocity as measurement of gas temperature, by A. L. Hedrich and D R. Pardue. Section V Miscellaneous topics Temperatures in atomic explosions, by F G. Brickwedde. Ionization measurements at high temperatures, by W Lochte-Holtgreven. Temperatures in the upper atmosphere, by H. E. Newell, Jr Author index. Subject index.

Note As indicated in their titles, these volumes contain the papers presented at two symposia, one held in 1939 the other in 1954 In both instances, the symposia were arranged to review and present fundamental principles and recent developments pertaining to the measurement and control of temperature. The participants were leading scientists and engineers of the United States of America and other countries actively engaged at the research level in fields where temperature measurement and control are of more than routine importance. Although the symposia were planned as units, each of the published papers is essentially complete in itself and can be read by graduate scientists and engineers without reference to the other papers if necessary Literature references are included in the individual papers. Both volumes are well indexed.

BERGMANN, PETER GABRIEL

Basic theories of physics heat and quanta. New York Prentice Hall, Inc., 1951 300 p illus. 22 cm (Prentice-Hall physics series, Donald H Menzel editor) $5 75 920

Contents Part I, Heat The kinetic hypothesis. Statistics in physics. Stationary ensembles. Thermodynamics, the first law Thermodynamics, the second law Thermodynamics, statistical mechanics, and heat-death. Part II, Quanta: Summary of classical statistical mechanics. Early quantum theories. Atomic spectra. Probability waves. Quantization in wave mechanics. Approximation methods. The abstract theory Summary and outlook. Further reading. Index.

Note A textbook for graduate students in theoretical physics. The purpose of this and the companion work described below is to introduce students to "the fundamental ideas on which they can build up the detailed technical knowledge required of the modern practicing physicist. This book deals with the invasion of theoretical physics by the atom, Part I being devoted to the classical theory of heat from statistical point of view Part II being an introduction to quantum mechanics based on historical lines.

CAMPBELL, CHARLES H

Modern pyrometry New York Chemical Publishing Company 1951 150 p illus. 23 cm $4 00 921

Content Types and uses of thermocouples, lead wire, and protection tubes. Temperature indicators, recorders, and controllers. Other methods of temperature measurement and control. Applications, care and maintenance of pyrometers. References. Appendix. Index.

Note A brief but useful survey of currently used methods and instruments for the measurement of high temperatures. It is based on lecture prepared for delivery before meeting of the American Society for Metals. Instruments used in the measuring and recording of temperatures in the metallurgical industries are emphasized. Th book is designed for beginners in the metallurgical industries and other persons who need practical introduction.

EINSTEIN, ALBERT

Investigations on the theory of the Brownian movement. Edited with notes by R. Fürth. Translated by A. D Cowper With 3 diagrams New York Dover Publications Inc., 1956 122 p illus 21 cm $1.25 922

Contents On the movement of small particles suspended in a stationary liquid demanded by the molecular-kinetic theory of heat. On the theory of the Brownian movement. A new determination of molecular dimensions. Theoretical observations on the Brownian motion. Elementary theory of the Brownian motion. Notes. Subject index. Author index.

Note The five articles published in this volume were originally written in German and published in German periodicals. They were collected, translated, and first published in English in London in 1926. The edition listed here is an inexpensive reprint of the complete and unaltered text of the English edition. It contains not only the English versions of the original articles, but also 14 pages of editorial notes.

EPSTEIN, PAUL SOPHUS

Textbook of thermodynamics. New York John Wiley & Sons, Inc., 1937 406 p illus 23 cm $7 50 923

Contents The thermal properties of matter The first law of thermodynamics. The first law of thermodynamics and the caloric properties of matter The second law of thermodynamics. The trend of thermodynamical processes towards equilibrium. General conditions of equilibrium of thermodynamical systems. Phases of a chemically pure substance. Mixtures of perfect gases. Dilute solutions. Equilibrium of binary systems. Fugacities and activities. The capillary layer Nernst's postulate or the third law of thermodynamics. Bearing of Nernst's postulate on the absolute entropy of gases. Critical analysis of Nernst postulate. Degenerate perfect gases. Electron and ion clouds. Theory of specific heats. Equilibrium involving radiation. Magnetic and electric phenomena. The direction of thermodynamical processes. Limitations of thermodynamics. Appendices. Index.

Note A detailed and careful discussion, for physicists, of the applications of thermodynamics to numerous experimental facts. Particular attention is paid to those facts which involve quantum phenomena. General law are illustrated by the discussion of chemical applications of the laws of thermodynamics.

FERMI, ENRICO

Thermodynamics. New York Dover Publications, Inc., 1956 160 p. illus. 21 cm. $1 75 924

Contents Thermodynamic systems. The first law of thermodynamics. The second law of thermodynamics. The entropy Thermodynamic potentials. Gaseous reactions. The thermodynamics of dilute solutions. The entropy constant. Index.

Note An elementary treatise, based on a famous series of lectures delivered at Columbia University in the summer of 1936. It is elementary in the sense that mathematics beyond calculus is not employed in the exposition. It is distinguished by clear style and straightforward organization. It was first published in New York, 1937 The edition listed here is an unaltered reprint.

GORANSON, ROY WALDEMAR

Thermodynamic relations in multi-component systems Washington, D C. Carnegie Institution of Washington 1930 329 p. 23 cm. (Carnegie Institution of Washington Publication no 408) $6.00 925

Content Fundamental ideas. Simple homogeneous systems. Homogeneous binary systems of variable mass and composition. Homogeneous n-component systems. Strain. Stress. Thermodynamic treatment of systems homogeneously strained. The stress-strain relations for isothermal changes of state. Systems not in equilibrium. Irreversible processes. Introduction to the tables of thermodynamic relations.

Note A mathematical outline of the fundamental physical hypotheses involved in the theoretical foundation of thermodynamics essential in evaluating the 70,500 tabulated derivatives, together with functional interrelations necessary for obtaining derivatives not tabulated. As many as possible of the thermodynamic relations existing between the quantities of homogeneous multi-component systems in terms of quantities that can be obtained from experiment are given.

INGERSOLL, LEONARD R., AND OTHERS

Heat conduction with engineering geological and other applications By Leonard R. Ingersoll, Otto J Zobel and Alfred C. Inger

Magnetic properties of [illegible] helium superconducting lead sphere, by J. Babiskin. Studies on oscillating superconducting spheres, by R. H. Fry and others. Eddy currents and supercurrents in rotating metal spheres at liquid-helium temperatures, by P. R. Akers and others. Atomic heat of indium at liquid-helium temperatures, by J. R. Clement and E. H. Quinnell. Specific heat of niobium at various temperatures, by A. Brown and others. High frequency resistance of tin, lead, and helium, by C. J. Grebenkemper and P. P. Hagen. Detection of microwave signals by NbN superconductors in the transition region, by J. V. Lebacqz and M. G. Bodgers. Properties of liquid He³-He⁴ mixtures, by J. G. Daunt and C. V. Heer. Phase diagrams of dilute solutions of He³ in He⁴ below the lambda point, by H. S. Sommers, Jr. A Bose-Einstein model of liquid helium applied to solutions of He³ in He⁴, by W. Band. Solidification of He³ by D. W. Osborne and others. Liquid-helium research in the Royal Society Mond Laboratory, by K. R. Atkins and others. Propagation of second sound below 1 K, by D. V. Osborne. Pressure dependence of second-sound velocity in liquid helium II, by R. D. Maurer and M. A. Herlin. The thermal Rayleigh disk in liquid helium II, by J. R. Pellam and W. B. Hanson. Apparatus for measuring the pressure dependence of the viscosity of liquid helium, by H. H. Kolm and M. A. Herlin. Remarks on scattering of slow neutrons by liquid helium, by L. Goldstein. Flow properties of helium II, by K. Mendelssohn. Transport rates of the helium film over various surfaces, by J. G. Dash and H. A. Boorse. Adiabatic oscillations in liquid helium, by J. E. Robinson. Helium II films, by D. G. Henshaw and L. C. Jackson. Some preliminary thermodynamic studies on helium adsorbed on titanium dioxide, by J. G. Aston and S. V. R. Mastrangelo. Thermal conductivity of liquid helium I, by C. Grenier. Evaporation rate of liquid helium II, by A. Wexler. Methods of determining very low thermodynamic temperatures; measurements with potassium-chromium-alum, by D. de Klerk. Behavior of single crystals of cobalt-ammonium-sulfate below 1 K, by S. Meister. A new effect found in paramagnetic crystals below 100 millidegrees absolute: the critical-field curve bounding the antiferromagnetic state, by C. G. B. Garrett. A new experimental method for the measurement of temperature and entropy at and below 1°K, by L. D. Roberts and J. W. T. Dabbs. Some laboratory aids to cryomagnetic research, by W. E. Henry. Current sensitivity and other characteristics of metal films at low temperatures, by A. van Itterbeek. The electric conductivity of graphite at liquid-helium temperatures, by L. Meyer and others. Normal resistivities at low temperatures, by K. Mendelssohn. Infrared absorption by metals at low temperatures, by E. G. Ramberg. The de Haas-van Alphen effect, by D. Shoenberg. Approximate calculations of the surface impedance of [illegible] metal in the anomalous region, by P. M. Marcus. Magneto-resistance of superconducting mercury, by T. G. Berlincourt and C. T. Lane. Magnetic susceptibility of liquid nitric oxide and the heat of dissociation of $(NO)_2$, by A. L. Smith and H. L. Johnston. Heat capacity of solid deuterium, from 1.5 to 1 K, by O. D. Gonzalez and others. Compressibility of liquid normal hydrogen from the boiling point to the critical point at pressures up to 100 atmospheres, by W. E. Keller and others. Elastic constants of rock salt, by W. C. Overton, Jr. and R. T. Swim. Specific heat of silicon below 100°K, by P. H. Keesom and N. Pearlman. Optical properties of F-centers at liquid-helium temperatures, by E. Burstein and J. J. Oberly.

Note A collection of 61 monographs, most of them brief. They were delivered originally as papers at one of the 1951 symposia conducted in observance of the 50th anniversary of the establishment of the National Bureau of Standards. Most of the papers are illustrated and include bibliographical references.

LIGHT AND OPTICS

EVANS RALPH MERRILL

An introduction to color New York John Wiley & Sons, Inc., 1948 340 p. illus. (part col'd) 25 cm. $8 50 938

Contents Color and light. The physical nature of light. Light sources. Illumination. Colored objects. The physics of everyday color. Color vision. The visual variables of color. Perception and illusion. Brightness perception. Color perception. The measurement of color. The specification of color. Color differences and color names. Mixtures of colored lights. Effects of illuminants. Transparent colorant mixtures. Paints and pigments. Color in photography. Color in art. Design and abstraction. General bibliography. Index.

Note This book is designed to provide [illegible] scientific background for understanding color and making practical use of it. However specific practical applications are cited only incidentally and the mystical and pseudo-scientific notions that appear in some books on color are altogether absent. Instead, the author has surveyed and synthesized pertinent topics from physics, physiology and psychology. He is associated with the Eastman Kodak Company and perhaps has given [illegible] shade of emphasis to aspects that are of special interest in color photography. The illustrative matter includes many graphs. There are chapter bibliographies and [illegible] general bibliography.

HERZBERGER, MAX

The limitations of optical image formation. New York The New York Academy of Sciences, 1946 30 p. illus 24 cm. (New York Academy of Sciences. Annals Volume 48 p. 1–30 1946) $0 75 939

Contents Introduction. Part [illegible] Point and diapoint. Part II. Second-order derivatives of *D* and *E*. Part III. Special systems. Spatial-symmetrical systems. Part IV. Spatial-symmetrical systems. The *diapoint* characteristic for [illegible] single refracting surface. Further applications of the theory. References.

Note This paper describes [illegible] new method of investigating the limitations of image formation which will assist lens designers in determining the image-forming qualities of an optical system. By the introduction of the concept of diapoint characteristic, demonstrated on [illegible] few classical examples, it is possible to find out at once whether the system in question images [illegible] point sharply symmetrically or half-symmetrically. The method also points the way to [illegible] new treatment of image errors. The *diapoint* analysis will be of interest to mathematicians as [illegible] as designers of optical instruments.

JACOBS DONALD HARRY

Fundamentals of optical engineering. New York McGraw Hill Book Company Inc. 1943 487 p illus. 21 cm. $8.00 940

Contents Part I, Fundamental considerations: Properties of beams. Lens aberrations. Theory of stops. Brightness of images in optical instruments. Properties of the eye. Optical materials. Polarized light. Low-reflectance lens coatings. Photographic objectives. Photographic shutters. Prisms used in optical instruments. Part II, Representative instruments: Telescopes. Binoculars and battery commander [illegible] telescopes. Periscopes. Gun sights. Range finders. Part III, Mechanical and electrical design: Optical instrument design. General considerations. Machining operations and casting methods. Bearings. Gears, clutches, couplings. Lens mountings permitting displacements. Electrical controls. Photoelectric cells. Part IV. Optical design: Ray tracing. Spherical aberration. Chromatic aberration. Coma. Design of aplanatic objectives. Eyepiece design. Optical tolerances.

Note Offers [illegible] comprehensive introduction to the methods and principles of optical design. After outlining the fundamentals of optics, the author gives an analytical description of the functioning and design of representative military optical instruments. In the next section the basic principles of the mechanical design of optical instruments are stated. The book concludes with an introduction to optical design that will enable the student to design aplanatic objectives and eyepieces.

JENKINS FRANCIS ARTHUR, AND HARVEY E. WHITE

Fundamentals of optics. Second edition. New York McGraw Hill Book Company Inc., 1950 647 p. illus. 24 cm. 941

Contents (abridged) Part I, Geometrical optics: Light rays. Plane surfaces. Thin lenses. Spherical surfaces. Thick lenses. Spherical mirrors. The effects of stops. Ray tracing. Lens aberrations. Part II, Physical optics: Interference of two beams of light. Interference involving multiple reflections. Fraunhofer diffraction by [illegible] single opening. The double slit. The diffraction grating. Fresnel diffraction. The electromagnetic character of light. Absorption and scattering. Dispersion. Polarization of light. Optical activity. Reflection. Magneto-optics and electro-optics. Part III. Quantum optics; Photons. Index.

Note A college textbook designed for students who have completed at least an introductory course in basic physics. The first edition was entitled *Fundamentals of physical optics*. The change in title was made necessary by the addition, in the present edition of the 175-page treatment of physical optics. Another addition is the 15-page chapter on photons. Other changes are relatively minor, but they include new or revised discussions of such topics as nonreflecting films, wide-angle interference, the electron microscope, and the phase-contrast microscope. A third edition, 634 p. $8.50, was published in 1957

WELD, LEROY DOUGHERTY

A textbook of heat for upperclassmen. New York The Macmillan Company, 1948 436 p illus 22 cm. $5 75 932

Contents The nature and the measurement of heat. Expansion of solids and liquids. Fusion, evaporation, and sublimation of pure substances. Observable behavior of gases. Molecular motion in pure gases. Thermodynamic processes and cycles. Entropy Fluid mixtures and suspensions. Thermal conduction and some thermal properties of metals. Thermal radiation. Very high and very low temperatures. Appendices. Indexes.

Note A clear style combined with relative brevity is the outstanding characteristic of this college textbook. Also instead of devoting a chapter to thermometry the various methods of temperature measurement are discussed throughout the work in connection with the physical phenomena associated with temperature changes. Lists of selected references accompany most of the chapters.

ZEMANSKY, MARK W

Heat and thermodynamics, an intermediate textbook for students of physics, chemistry, and engineering Third edition. New York McGraw Hill Book Company, Inc., 1951 465 p illus 24 cm 933

Contents. Temperature. Thermodynamic systems. Work. The first law of thermodynamics. Transfer of heat. Ideal gases. The second law of thermodynamics. Reversibility and irreversibility The Carnot cycle and the Kelvin temperature scale. Entropy Properties of pure substances. The steam engine and the refrigerator Applications of thermodynamics to pure substances. Applications of thermodynamics to pure substances to special systems. Change of phase. The physics of very low temperatures. Chemical thermodynamics. Ideal gas reactions. Heterogeneous systems. Bibliography Index. Answers to problems.

Note An outstanding textbook designed for the instruction of engineering college students who have completed college courses in basic physics and calculus and are preparing for careers as physicists, chemists or engineers. It provides thorough discussions of such topics as heat, calorimetry steam engines and the refrigerator Ten chapters are devoted to general principles, nine to applications. A fourth edition was published in 1957 484 p $7.50.

LOW TEMPERATURE PHYSICS

GARRETT, C G B

Magnetic cooling Cambridge Mass Harvard University Press, New York John Wiley and Sons Inc. 1954 110 p illus 22 cm (Harvard monographs in applied science No 4) $4 75 934

Contents Why demagnetize? Technique. Thermodynamics. The measurement of temperature and specific heat. The theory of paramagnetism at low temperatures. Results of paramagnetism of specific heat and susceptibility Coöperative effects Experiments on other materials below 1 K cascade demagnetization nuclear alignment. Index of names. Index of subjects.

Note. Magnetic cooling is an important research technique in the investigation of matter at temperatures below 1 absolute. Appropriately most of the space in this monograph on it, is given to the underlying scientific theory and to the major experimental results that have been gained to date. The book is written so that it can be read without reference to the related literature however the literature is cited in footnotes. It is of interest to graduate physicists and chemists, those who are concerned with the fundamental properties of matter as well as to those who are engaged in or are preparing for research in the low-temperature field.

LONDON, FRITZ

Superfluids. New York John Wiley & Sons, Inc., 1950–54 2 v illus 24 cm. (Structure of matter series Maria Goeppert Mayer advisory editor) Vol. I, o p vol II, $8.50 935

Contents Volume I, Macroscopic theory of superconductivity. Some properties of superconductors and their thermodynamical correlation. The electrodynamics of the pure superconducting state. The intermediate state. The phase transition into the superconducting state reconsidered. Program for the molecular theory of superconductivity Name index. Subject index. Volume II, Macroscopic theory of superfluid helium Some remarkable properties of liquid helium. Energy and structure of condensed helium at absolute zero. The evolution of the two-fluid concept. The hydrodynamical quasi-continuum. Two-fluid thermohydrodynamics. The helium isotope He^3 Conclusion Appendix. Recent monographs and conference reports. Name index. Subject index.

Note The late Professor London viewed the superconductivity of metals cooled to very low temperatures and the extraordinary flowing of liquid helium as quantum mechanisms occurring on macroscopic scale and in these books, has advanced this explanation as a theory or hypothesis. The experimental results are described and analyzed in this light, and equations expressing the basic relationships are offered. The special properties of superfluid helium are interpreted in terms of the Bose-Einstein condensation mechanism. The books are basic ones for scientists who are interested in low-temperature phenomena and research.

SQUIRE, CHARLES F

Low temperature physics. New York McGraw Hill Book Company, Inc., 1953 244 p. illus 24 cm. (International series in pure and applied physics, G P Harnwell, consulting editor) $6 50 936

Contents Gas liquefaction and the equation of state. Experimental methods of low-temperature physics. Theoretical considerations of the equation of state. Liquid helium—thermal properties—dynamic properties. Theories of liquid helium. Superconductivity Magnetism at low temperatures. Thermal energy in the solid state at low Dielectric properties at low temperatures. Appendix. Index.

Note A graduate-level textbook developed at Rice Institute. In the first two chapters, the principles and methods of gas liquefaction and currently used experimental methods in low temperature physics are covered very concisely In the remainder of the book, low temperature phenomena are explained and analyzed in terms of quantum mechanics. There are frequent references both to classical experiments and to recent ones. Articles published as recently as 1952 are listed in footnotes. Aside from its primary use, the book will be of interest to college teachers of physics and other graduate physicists in need of an up-to-date survey of this interesting field.

SYMPOSIUM ON LOW TEMPERATURE PHYSICS

Low temperature physics Proceedings of the NBS Semicentennial Symposium on Low Temperature Physics held at the NBS on March 27 28 and 29, 1951 Washington D C Government Printing Office, 1952 291 p illus 24 cm (United States National Bureau of Standards Circular 519) $2 00 937

Contents Theory of the superconducting state, by H. Fröhlich. Superconductivity and lattice vibrations, by J Bardeen. On the nature of the superconducting transition, by L. Tisza. Field theoretic description of interactions in superconductor by M. Dresden. Determinantal eigenfunctions for the theory of superconductivity by W Band. Superconductivity of isotopes of mercury and tin, by C. A. Reynolds and others. Recent work at the National Bureau of Standards on the isotope effect, by E. Maxwell. Superconductivity of the isotopes, by J M. Lock and others. Superconductivity at the Clarendon Laboratory by K. Mendelssohn. Heat transfer in superconducting alloys, by J K. Hulm. Experiments on the magnetic transition from the superconducting state to the normal state, by M. P Garfunkel and B. Serin. New experiments on the superconductivity of metal-layers condensed at low temperatures, by R. Hilsch. Kinetics of the superconducting phase transition, by T E. Faber Superconducting properties of indium-thallium alloys, by J W Stout and L. Guttman. Investigation of superconductivity in lead compounds, gold alloys, and molybdenum carbide, by R. P Hudson and K. Lark Horovitz. Superconductivity in Mg_3Tl and LiBi, by L. Guttman and J W Stout. New superconducting compounds, by B T. Matthias and J. K. Hulm. Occurrence of superconductivity below 1 K, by B. B. Goodman. Penetration of magnetic field into thin superconducting films, by J M. Lock

by G. S. Monk. An all-plastic optical system for project purposes, by G. S. Monk. A new wide-angle all-plastic periscope, by G. S. Monk. Scratch resistance of plastic optical materials, by K. F. Monk. Light transmission through [illegible] water-filled tube, by Whitcomb. Light [illegible] G. S. Monk and R. W. Baer. Report on shadow tests, by W. G. Beerstine. Borescope cameras, by R. L. Williams and W. H. McCarthy. Water-filled wide-angle viewers, by G. S. Monk. The use of high-density radiation-absorbing solutions in optical instruments, by P. E. Gerould. Experiments on the evaporation of barium in vacuo, by D. D. Friel. Some observations on controlled deposition of metals by cathode sputtering, by D. C. Livingston. Production of mirrors by the evaporation procedure, by E. R. Piirosky. Grinding and polishing of metallic mirrors, by N. F. Beardsley. Waterproof cements and their suitability in optical construction, by K. F. Whitcomb. Index.

Note: An account of the optical needs and problems encountered in the work of the Plutonium Project at the University of Chicago during World War II, and of the various instruments which were devised to solve them. Although the descriptions of the instruments are condensed, in most cases the optical systems are diagrammed, and in some instances there is also a diagram or photograph of the associated mechanical parts. A reference to the original technical report on which the description is based is supplied. The instruments described have, of course, specific applications in laboratories where radioactive materials are handled, and some of them have wider uses. The chapters on plastic lenses and optical systems employing them are of special interest.

OPTICAL SOCIETY OF AMERICA. COMMITTEE ON COLORIMETRY

The science of color New York Thomas Y. Crowell Company 1953 385 p. illus. (part col'd) 26 cm. $7.00. 947

Contents: Introduction. The historical background and evolution of the Colorimetry report. From the art of coloring to the science of color. The concept of color. Anatomy and physiology of color vision. Psychological concepts—sensory aspects of color—perceived and affective aspects of color. Physical concepts—radiant energy and its measurement. Psychophysics of color. Quantitative data and methods for colorimetry. Colorimeters and color standards.

Note: An authoritative work that represents a landmark in the literature of color. It replaces the society's well-known "Report of Committee on Colorimetry for 1920–21," which was published in the Optical Society of America's *Journal*, August, 1922. The first two chapters are only semitechnical and can be read by anyone with a serious interest in color. The remaining chapters are technical accounts replete with literature references and tables of data and are intended for specialists in colorimetry and others equipped to understand technical literature. The concept of color given is a psychophysical one. Special attention is given to a consistent terminology and to definitions of terms. There is an extensive, classified bibliography.

ROBERTSON, JOHN K.

Introduction to optics geometrical and physical. Fourth edition. Princeton D. Van Nostrand Company Inc., 1954 416 p. illus. 23 cm. $6.50 948

Contents: Why we study wave motion. The velocity of light. Reflection and refraction by Huygens' principle. Further study of lenses. Vision through an instrument—the telescope and the microscope. Dispersion. Study of wave motion. Interference—thin films and plane parallel surfaces. Diffraction. Fraunhofer diffraction. Double refraction. Plane polarized light. Interference of polarized light. Rotatory polarization. The electromagnetic theory of light. The origin of spectra. Radiation and the quantum theory. Spectral series and origin of spectra. Radiation potentials, absorption and band spectra. The *Quantum*. Can the existence of an ether be detected? Tables. Answers to problems. Index.

Note: A standard work widely used as a textbook in universities in Canada and the United States of America since the publication of the first edition in 1929. Light optics is the principal subject. However, in this edition there is also a short discussion of the principles of the electron microscope. Throughout the volume principles and applications are described primarily in physical terms and no mathematics more advanced than simple algebraic equations is employed. The book is written in a clear style and is very fully illustrated, two features that make it useful to teachers and enrolled in college courses as well as to college students. The third edition was published in 1941. In this fourth edition, [illegible] material on such developments as the phase contrast microscope has been added, and the book has been given a new and more attractive format.

SEARS, FRANCIS WESTON

Optics. Third edition Reading Mass. Addison Wesley Publishing Company Inc., 1949 369 16 p. illus. (part col'd) 23 cm. $8.50 949

Contents: The nature and propagation of light. Reflection and refraction at plane surfaces. Reflection and refraction at spherical surfaces. Lenses. Lens aberrations. Optical instruments. Polarization. Interference. Diffraction. Limit of resolution. Line spectra. Thermal radiation. Photometry. Color. Index. Answers to problems.

Note: An outstanding textbook which was first published as Volume III of the author's three-volume *Principles of physics*, a text book developed and used in a two-year course in physics at the Massachusetts Institute of Technology. However, *Optics* is an independent work and is so used in college courses in optics. It is an intermediate-level exposition of fundamental principles and includes also discussions of the applications of these principles in basic instruments such as the microscope. It is directed to students who are pursuing courses in physical science or engineering. In this third edition, there are many new diagrams and new problems; also some of the chapters have been rather extensively rewritten.

SOUTHALL, JAMES POWELL COCKE

Mirrors, prisms and lenses a text book of geometrical optics. Third edition. New York The Macmillan Company 1933 806 p. illus. 20 cm. $8.50 950

Contents (abridged): Lights & shadows. Reflection of light. Refraction of light. Refraction at a plane surface. Refraction through a prism. Reflection & refraction of paraxial rays at a spherical surface. Change of curvature of the wave-front in reflection and refraction. Aplanatic lenses. Geometrical theory of the symmetrical optical instrument. Compound systems. Aperture & field of optical system. Optical system of the eye. Distortion & achromatism. Rays of finite slope. The microscope. Notes on physical optics & physiological optics.

Note: A standard introduction to geometrical optics, still useful although it has not been revised in recent years.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Optical image evaluation. Proceedings of the NBS Semicentennial Symposium on Optical Image Evaluation held at the NBS on October 18 19 and 20 1951 Washington, D C. Government Printing Office 1954 289 p. illus. 24 cm. (United States. National Bureau of Standards Circular 526) $2.25 951

Contents: Introduction, by I. C. Gardner. The diffraction theory of aberrations, by F. Zernike. The contrast of optical images and the influence of aberrations, by A. Maréchal. Diffraction images produced by fully corrected objectives of high numerical aperture, by H. Osterberg and R. A. McDonald. Bases for testing photographic objectives, by L. E. Howlett. Quality aspects of the aerial photographic system, by D. F. Macdonald. A mathematical model of an optical system, by M. Herzberger. Methods and apparatus for measuring performance and quality of optical instruments, by A. Arnulf. Image quality as used by the Government inspector of naval telescopic instruments, by H. S. Coleman. Application of Fresnel diffraction to measurements of high precision, by A. C. S. van Heel. Image structure and test data, by J. G. Baker. Geometrical and interferential aspects of the Ronchi test, by G. T. di Francia. A combined test procedure for camera lenses, and photoelectric examination of intensity distribution in line images, by E. Ingelstam and P. J. Lindberg. Measurements of energy distribution in optical images, by R. E. Hopkins and others. Optical calculations at the National Bureau of Standards, by D. P. Feder. Resolving power of airplane-camera lenses, by F. E. Washer. Theory of resolving power, by E. W. H. Selwyn. A new system of measuring and specifying image definition, by O. H. Schade. Position of best focus of a lens in the presence of spherical aberration, by R. Kingslake. Image evaluation by edge gradients, by A. Cox. A proposed approach to image evaluation, by R. V. Shack. Excerpt from a letter from T. Smith.

Note: The Symposium on Optical Image Evaluation was devoted to a re-examination and comparison of the different methods of image evaluation with the purpose of placing them on a sound

JUDD, DEANE BREWSTER

Color in business, science and industry New York John Wiley & Sons, Inc, 1952 401 p illus 24 cm $8 50 942

Contents Part I Basic facts The eye. Aspects of color (basic terms) Color matching. Color deficiencies. Part II, Tools and techniques Spectrophotometry Fundamental standards in colorimetry Visual colorimeters. Reproduction of pictures in color Colorimetry by difference. Color standards. Uniform color scales. Color languages. Part III Physics and psychophysics of colorant layers Gloss. Opacity or hiding power Kubelka-Munk analysis. Identification of colorants. Formulation of colorants. Appendix. References. Index.

Note A substantial manual of color standards, color measurements, and certain other selected aspects of color that are of particular concern in commerce and industry It is addressed to persons with education in basic physics and some familiarity with color problems. Colorimetry is covered thoroughly and leading types of spectrophotometers are compared. Various published color standards are discussed specifically The treatment of colorant layers, that is such finishes as varnish or wax over wood and ceramic glazes over baked clay is an analytical study based on optical principles. There is an extensive list of references to the literature.

JUDD, DEANE BREWSTER

Colorimetry Washington, D C. Government Printing Office, 1950 56 p illus 26 cm. (United States. National Bureau of Standards Circular 478) $0.30 943

Contents Introduction: Definition and nature of color Basic principles of measurement. The standard observer Illuminants and coordinate system Reduction of spectrophotometric data to colorimetric terms. Direct colorimetry Small-difference colorimetry: Martens photometer Chromaticity-difference colorimeter Photoelectric tristimulus colorimeters. Perceptibility of color differences. Material standards of color Transparent media. Opaque media. One-dimensional color scales Color temperature. Lovibond grading of vegetable oils. Union-colorimeter grading of lubricating oils. Saybolt-chromometer grading of refined petroleum. U S. color standards for rosin. Color standards for paint vehicles. General methods. References.

Note This pamphlet brings together in concise form a description of the standards and methods presented in many scientific and technical publications between the years 1930 and 1950. Color is defined, and the basic principles of its measurement are outlined. Reduction of photometric data is described, three methods being illustrated by examples. The various methods of direct colorimetry the most useful collections of material color standards, the most widely used one-dimensional color scales, and the best known of the specifications of color having general applicability are described. The illustrative material includes 34 figures, mostly diagrams, and 19 tables. The bibliography lists 144 references.

KELLY, KENNETH L, AND DEANE B JUDD

The ISCC–NBS method of designating colors and a Dictionary of color names Washington, D C. Government Printing Office, 1955 158 p illus 27 cm. (United States National Bureau of Standards. Circular 553) $2 00 944

Contents. History Scope Applications. Logic of designations: The color solid. Basic plan of forming the designations. Divisions of the hue circle Some unavoidable disadvantages. Definition of the color ranges. Color designations from the *Munsell book of color* for diverse types of specimens. Dry opaque powders. Opaque solids. Liquids and nonpowdered solids. Microscopic specimens. Color designations from chromaticity coordinates and daylight reflectance. Description of the *Dictionary of color names*. Listing by source of color name and by ISCC-NBS designation American Association of Textile Chemists and Colorists and the Society of Dyers and Colourists. Biology Federal Specification TT-C-595. *Horticultural colour chart Maerz and Paul Dictionary of color* Molded urea plastics and polystyrene plastics. *Plochere color system Ridgway color standards and nomenclature. Rock color chart* Postage-stamp color names USDA Soil color charts. *Descriptive color names dictionary* Textile Color Card Association of the United States. Description of the alphabetical list of color names. Summary References. Color name charts. Synonymous and near-synonymous color names with their sample identifications. Dictionary of color names.

Note This publication consists essentially of four parts (1) the history and theory of color designations according to the revised usage of the Inter-Society Color Council and the National Bureau of Standards, concluded by a bibliography of 61 references (2) the color name charts with directions for their use (3) the graded list of 267 separately recognized colors (from vivid pink to black) under each of which are the names of the various synonyms and near-synonyms for the same taken from recognized color dictionaries and from the color sources of various art and industry groups and (4) the dictionary of approximately 7,500 color names, an alphabetical listing (from Abbey to Zuni brown) which gives the color name the source of the color name, and the ISCC-NBS color designation with serial number The purpose of the book is to assist scientists, artists, businessmen, and laymen to understand the different color vocabularies used in the many fields of science, art, and industry It is noteworthy and in keeping with its purpose that the publication includes no charts of colors.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY COLOR MEASUREMENT LABORATORY

Handbook of colorimetry Prepared by the staff of the Color Measurement Laboratory, Massachusetts Institute of Technology, under the direction of Arthur C. Hardy Cambridge, Mass The Technology Press, Massachusetts Institute of Technology, 1936 87 p illus. 33 cm $5 00 945

Contents The physical basis of color specification. Sources of light. Spectrophotometry The laws of color mixture. Determination of tristimulus values by the weighted ordinate method. Determination of tristimulus values by the selected ordinate method. Trichromatic coefficients. Graphical representation of colorimetric data. Index.

Note This book contains authoritative discussions of the problems of scientific color specifications, including such concepts as tristimulus values and such standards as I.C.I. (International Commission on Illumination) illuminants and the I.C.I. Observer. In a sense, it is a guide to the interpretation of color measurements made with the spectrophotometer To some users the most valuable features are the tables and charts. Typical of the former is a tabulation of the energy distributions for a considerable range of wavelengths of I.C.I illuminants A, B, and C. The latter include a series of 21 charts designed to facilitate the conversion of tristimulus values into brightness, dominant wavelength, and purity

MONK, GEORGE S, AND W H MCCORKLE, editors

Optical instrumentation By members of the staff of the Optics Section Metallurgical Laboratory University of Chicago New York McGraw Hill Book Company Inc., 1954 262 p illus 24 cm (National nuclear energy series. Manhattan Project Technical Section. Division IV—Plutonium project record Volume 8) $3 75 946

Contents Part I Survey of optical and associated problems. Optical problems in the metallurgical project. Optical instruments for viewing in irradiated areas. Miscellaneous instruments and services of the project optical section. Part II, Collected papers A standard periscope design for project purposes, by G. S. Monk. Comparative tests of periscope extenders, by G S. Monk and W Wallin. The erecting objective magnifier by G. S. Monk Design of Kellner type plastic objective by M Mrjenovich. Achromat with positive element of two plastic field lenses, by M. Mrjenovich. Borescopes in the project, by G. S. Monk and others. Experiments on borescope head, by G. S. Monk. Periscope for discharge area of pile, by G. S. Monk and W T Jayton. The binocular periscope, by G. S. Monk. The corner periscope by G. S. Monk and others. A visual inspector for slugs, by M. C. Leverett and others. Underwater bar viewer by W. H. McCorkle. The periscope by G. S. Monk. Type D-A periscope by W H. McCorkle Type D-B periscope by W H. McCorkle. The chemiscope by W H. McCorkle. The shelfscope, by W H. McCorkle. The A-A periscope by W H. McCorkle. Type C B periscope, by G S. Monk and W H. McCorkle. The extensoscope, by G. S. Monk. Coloration of a standard periscope objective, by G. S. Monk Miscellaneous notes on coloration of optical materials, by G. S. Monk. Colorimetry of optical glasses, by G. S. Monk. *The case for plastic lenses,*

extensive bibliographies are a feature. The current edition of the first volume is the second edition, published in 1950. The current edition of the second volume is the first edition, published in 1941. Although planned as a three-volume work, only the two volumes listed here have been published to the close of 1956.

KISLIUK, PAUL, AND CHARLES H. TOWNES

Molecular microwave spectra tables. Washington, D. C. Government Printing Office 1952 127 p. 26 cm. (United States. National Bureau of Standards. Circular 518) $0.65 958

Contents: Introduction. Description of tables. Molecular microwave spectra tables: Molecules listed alphabetically by chemical symbol. Lines listed in order of frequency. Casimir's function. Indexes: Molecules by chemical symbol. Molecules by name. Authors listed alphabetically including a list of the molecules with the reference numbers.

Note: This group of tables gives the frequencies, assignment of quantum numbers, and intensities of about 1800 microwave absorption lines. The best available values of other pertinent molecular data, such as rotational constants, dipole moments, quadrupole coupling constants, and rotation-vibration interaction constants, are also included. The frequencies are listed once for each molecule, and again in consecutive ascending order of frequency. References are given for all data included. For easy calculation of quadrupole hyperfine structure, Casimir's function is tabulated up to I = [illegible] and J = 9/2. Explanations of the tables and a short discussion of microwave spectra and important formulas are given in the introduction.

MOORE, CHARLOTTE EMMA

An ultraviolet multiplet table. Washington, D. C. Government Printing Office, 1950–52 2 sections. 78, 115 p. 29 cm. (United States. National Bureau of Standards. Circular 488 sections 1–2) Section 1 $0.45 section 2 $0.70. 959

Contents: Section 1. The spectra of hydrogen, helium, lithium, beryllium, boron, carbon, nitrogen, oxygen, fluorine, neon, sodium, magnesium, aluminum, silicon, phosphorus, sulfur, chlorine, argon, potassium, calcium, scandium, titanium, and vanadium. Section 2. The spectra of chromium, manganese, iron, cobalt, nickel, copper, zinc, gallium, germanium, arsenic, selenium, bromine, krypton, rubidium, strontium, yttrium, zirconium, and niobium.

Note: The first two sections of a table extending multiplets in the ultraviolet beyond the limit of the *Revised multiplet table* by Charlotte E. Moore (*Contr. Princeton Univ. Observ.* no. 20) published in 1945, which because of its limited wavelength range had proved to be inadequate. The two sections contain the leading multiplets of 123 spectra of the first [illegible] elements of the periodic table. The form of arrangement is identical with that of the *Revised multiplet table*, except that bibliographical references are included with each spectrum instead of being grouped together at the end.

SAWYER, RALPH ALANSON

Experimental spectroscopy Second edition. New York Prentice-Hall, Inc., 1951 358 p. 24 cm. $7.50. 960

Contents: History of spectroscopy. Light sources. Spectroscopic apparatus—general principles. Prism spectroscopes and spectrographs—theory and construction. Prism spectroscopes and spectrographs—types and use. The diffraction grating—theory and production. The diffraction grating—mountings and use. The photographic process. The determination of wave length. The determination of spectral intensity. Apparatus and methods of infrared spectroscopy. The spectroscopy of the vacuum ultraviolet. Spectrochemical analysis. Name index. Subject index.

Note: A useful manual of information about standard spectrographic techniques and apparatus. It is designed for readers with practical interest in the subject such as research workers in college laboratories and analytical chemists in industry. Readers will need background knowledge of basic physics and physical optics. In the present edition useful and rather extensive changes have been made. These include expanded discussions of certain topics, the inclusion of information from publications since 1944, and a few additions to the literature citations.

TOWNES, C. H., AND A. L. SCHAWLOW

Microwave spectroscopy New York Mc Graw-Hill Book Company, Inc. 1955 698 p illus. 24 cm. (International series in pure and applied physics Leonard I Schiff consulting editor) $12.50 961

Contents: Rotational spectra of diatomic molecules. Linear polyatomic molecules. Symmetric-top molecules. Asymmetric-top molecules. Atomic spectra. Quadrupole hyperfine structure in molecules. Molecules with electronic angular momentum. Magnetic hyperfine structure in molecular spectra. Interpretation of hyperfine coupling constants in terms of molecular structure and nuclear moments. Stark effects in molecular spectra. Zeeman effects in molecular spectra. The ammonia spectrum and hindered motions. Shapes and widths of spectral lines. Microwave circuit elements and techniques. Microwave spectrographs. Millimeter waves. Frequency measurement and control. The use of microwave spectroscopy for chemical analysis. Appendices: Intensities of hyperfine structure components and energies due to nuclear quadrupole interactions. Second-order energies due to nuclear quadrupole interactions in linear molecules and symmetric tops. Coefficients for energy levels of a slightly asymmetric top. Energy levels of a rigid rotor. Transition strengths for rotational transitions. Molecular constants involved in microwave spectra. Properties of the stable nuclei (abundance, spin and moments). Bibliography. Author index. Subject index. Fundamental constants and conversion factors.

Note: "Microwave spectroscopy" is the accepted term for spectroscopic techniques based upon the absorption of radiation in the 1 to 1000 mm. range. In the past decade and a half these have been developed into a powerful research tool for the investigation of molecules and atoms, in such fields of scientific investigation as nuclear physics, chemical kinetics, and quantum electrodynamics. This book is a full-scale survey of the present state of the field, including the techniques, the experimental findings, and their interpretation. The list of literature references runs to more than 1,000 entries, and statements and data given in the body of the book are keyed to the citations. Extensive tabulations of reference data are contained in the appendix.

UNITED STATES NATIONAL BUREAU OF STANDARDS COMPUTATION LABORATORY

Tables for the analysis of beta spectra. Washington, D. C. Government Printing Office 1952 61 p. illus 26 cm. (United States. National Bureau of Standards. Applied mathematics series 13) $0.40 962

Contents (abridged): Introduction. Beta spectra. References. Figures: Graph of [illegible]. Graph of [illegible] spectrum in [illegible]. Spectrum of [illegible] after elimination of the unfinished factor. Determination of the maximum energy. Positron spectrum of [illegible]. Fermi-Kurie plots of allowed spectra. Fermi-Kurie plot of [illegible] forbidden spectrum. Graph of [illegible]. Graph of outer screening potential. Auxiliary tables: Values of [illegible] for electrons of given momentum, [illegible]. Values of [illegible] for electrons of given kinetic energy. Table of [illegible]. Illustrating the importance of the relativistic effect. Illustrating the accuracy of the Bethe-Bacher approximation. Table for the evaluation of the screening effect. Table of the Fermi function.

Note: Most of the space in this pamphlet is devoted to the table of the Fermi function. The titles of the auxiliary tables and graphs are given above. To quote the introduction: "The primary purpose of these tables is to assist in the theoretical analysis of experimental data on β-ray spectra. This analysis involves the use of the function of [illegible] complex argument.

WILSON, E. BRIGHT, JR., AND OTHERS

Molecular vibrations the theory of infrared and Raman vibrational spectra. By E. Bright Wilson, Jr., J. C. Decius and Paul C. Cross New York McGraw-Hill Book Company Inc., 1955 388 p illus. 24 cm. $8.50. 963

Contents: Introduction. The vibration of molecules. Wave mechanics and the vibrations of molecules. More advanced methods of studying vibrations. Symmetry considerations. Applications of group theory to the analysis of molecular vibrations. Vibrational selection

engineering basis. The volume of *Proceedings* reprints 20 technical papers on different phases of fundamental optics presented at the symposium, nine of them including bibliographical references. Discussion of some of the papers is included.

VALESEK, JOSEPH

Introduction to theoretical and experimental optics New York John Wiley & Sons, Inc., 1949 454 p illus 22 cm $7 50 952

Contents. Geometrical optics. *Fundamental principles.* Ideal optical systems. Computation of constants. Physical limitations of optical images. Apertures of optical systems. Photometry and image brightness. Optical instruments. Stereoscopy Physical optics: Wave propagation. Interference of light. Diffraction. Polarization and double refraction. Optical activity Refraction and dispersion. Optical constants of metallic absorbers. Radiation and spectra Thermal radiation. Line and band spectra. X-ray spectra. Magneto- and electro-optics. Measurement of color The scattering of light. Experimental optics Experiments. Appendix. Answers to problems. Bibliography Index.

Note Although this book is not systematic treatise it includes material on both geometrical and physical optics and on theory and experimental work. It is addressed primarily to advanced students of physics with an interest in optics. However it also provides for graduate laboratory technicians and engineers at work in industry concise expositions of optical concepts and techniques which are not readily found in older treatises.

SPECTROSCOPY

GORDY, WALTER, AND OTHERS

Microwave spectroscopy By Walter Gordy, William V Smith and Ralph F Trambarulo New York John Wiley & Sons, Inc., 1953 446 p illus 24 cm (Structure of matter series Maria Goeppert Mayer, advisory editor) $8 75 953

Contents Instruments and experimental methods. Microwave spectra of gases. Stark and Zeeman effects. Shapes and intensities of absorption lines of gases. Spectra of solids and liquids. Nuclear properties. Electrical properties of molecules. Molecular structures. Applications in other fields. Appendix. Bibliography Name index. Subject index.

Note. A concise survey of the whole field of microwave spectroscopy It covers the instruments and techniques, and also presents, chiefly in tabular form, the knowledge of atomic and molecular structure that has been gained by the use of microwave spectroscopy to 1952 with some data included from the literature of that year It is written essentially from the standpoint of graduate scientists who are interested in the potentialities of the technique However the tabulated data may be used independently of the expository text. The book is therefore useful for reference to chemists and physicists who are not interested in the techniques. The comprehensive bibliography is classified by subject and within subjects is arranged by year

HARRISON, GEORGE RUSSELL, editor

Massachusetts Institute of Technology wavelength tables with intensities in arc, spark or discharge tube of more than 100,000 spectrum lines most strongly emitted by the atomic elements under normal conditions of excitation between 10 000 A and 2,000 A, arranged in order of decreasing wavelengths Measured and compiled under the direction of George R. Harrison by staff members of the Spectroscopy Laboratory of the Massachusetts Institute of Technology assisted by the Works Progress Administration New York John Wiley & Sons Inc., 1939 429 p 28 cm $17 50 954

Note These tables are designed principally for use in spectroscopic analysis of materials and for identifying impurities. One of the most valuable features of the book is the intensity scale which has been expanded to a range of 1–9000. Twenty-five different ratings are given in this range. More than 400 pages of tables are included in the book, each containing 253 lines. Also included are a few pages of short tables containing lists of sensitive lines of the elements, and descriptive material interpreting the tables and telling how the measurements and compilation were made.

HARRISON, GEORGE RUSSELL, AND OTHERS

Practical spectroscopy, by George R. Harrison, Richard C. Lord and John R. Loofbourow New York Prentice-Hall, Inc. 1948 605 p illus 22 cm. (Prentice-Hall physics series, Donald H Menzel, editor) $9 00 955

Contents Spectroscopy as a scientific tool. Selection of spectroscopic instruments. Prism spectroscopes and spectrographs. Diffraction-grating spectrographs. The testing, adjustment, and care of spectroscopic equipment. Illumination of the spectroscope. Photography of the spectrum. Light sources for spectroscopy Identification of spectrum lines. The origins of atomic spectra. Molecular spectra and molecular structure. The measurement of spectral intensities. Photographic photometry Absorption spectrophotometry Qualitative spectrographic analysis of materials. Quantitative spectrochemical analysis. Spectroscopy of the infrared region. Raman spectroscopy Spectroscopy of the vacuum ultraviolet. Interferometric spectroscopy Appendices. Index.

Note A survey of spectroscopic techniques and apparatus for chemists, physicists, and other scientific research workers. It is addressed to readers who are not specialists in spectroscopy but who use, or are interested in using, spectroscopy as an analytical or research technique. The physical principles which are the bases of the various types of spectroscopy are explained in considerable detail, and wide range of spectroscopic apparatus is discussed from the viewpoint of principles, characteristics, and uses. These discussions are addressed to scientists and contain good deal of laboratory "know-how Related literature is cited both in footnotes and in selected reference lists at the ends of chapters. The authors are all associated with the Spectroscopy Laboratory of Massachusetts Institute of Technology

HERZBERG, GERHARD

Molecular spectra and molecular structure. I Spectra of diatomic molecules With the cooperation, in the first edition, of J W T Spinks Second edition. Princeton D Van Nostrand Company, Inc., 1950 658 p illus. 24 cm $12 50 956

Contents. Introduction Résumé of the elements of atomic structure. Observed molecular spectra and their representation by empirical formulae. Rotation and vibration of diatomic molecules—interpretation of infrared and Raman spectra. Elementary discussion of electronic states and electronic transitions *Finer details* about electronic states and electronic transitions. Building-up principles, electron configurations, and valence. Continuous and diffuse molecular spectra—dissociation and predissociation. Examples, results, and applications. Appendix Vibrational and rotational constants for the electronic states of all known diatomic molecules (table 39) Bibliography Author index. Subject index.

——— Infrared and Raman spectra of polyatomic molecules. Forming the second volume of *Molecular spectra and molecular structure* Princeton D Van Nostrand Company, Inc., 1945 632 p. illus 23 cm $12.50 957

Contents Rotation and rotation spectra. Vibrations, vibrational energy levels, and vibrational eigenfunctions. Vibrational infrared and Raman spectra. Interaction of rotation and vibration, rotation-vibration spectra. Applications. Appendix Physical constants and conversion factors. Bibliography Author index. Subject index.

Note A comprehensive treatise addressed to advanced students and graduate research workers in chemistry and physics. The subject is the measurement and interpretation of energy levels in molecules. The reader needs some knowledge of wave mechanics; however most of the text is expressed in physical rather than mathematical terms. The work is based on the literature and

matter in the bibliography which is international in scope and comprehensive for literature published up to May 1948. The book is intended for graduate physicists and other scientists working in the field or seeking data from it. The author is associated with the Argonne National Laboratory

OTHER RADIATION

CLARK, GEORGE L.

Applied X-rays. Fourth edition. New York McGraw Hill Book Company Inc., 1955 843 p. illus. 24 cm. $12.50. 968

Contents: Part I, General physics and applications of X-radiation. Before and after the discovery by Röntgen. X-ray tubes. High-voltage equipment. The measurement of intensity (dosage). The measurement of quality (wavelength)—X-ray optics. X-ray spectra and atomic structure. Chemical analysis from X-ray spectra. The absorption and scattering of X-rays. Radiography (Roentgenography). Microradiography. The chemical effects of X-rays. The biological effects of X-radiation. Part II, The X-ray analysis of the ultimate structure of materials: Crystallography and X-ray diffraction. The experimental X-ray methods of crystal analysis. The interpretation of diffraction patterns in terms of ultimate structure. The results of crystal analysis—elements and inorganic compounds. Crystal chemistry. The silicates. Alloys. Organic compounds. The structure of glasses, liquids, and other colloidal and amorphous materials. The texture of metals. Polymers—synthetic and natural materials with giant molecules. Appendix. Space-group symbols. Index.

Note: A comprehensive treatise on technology and applications of X-rays. Its central theme is the use of X-rays in pure and applied scientific research; however, there is some information included on most aspects of X-rays. For example, in the chapter on biological effects, both harmful and beneficial effects are described. Applications covered range from medical diagnosis to studies of molecular structure. The third edition was published in 1940. Although the chapter titles in this fourth edition are not greatly changed, there has been a very extensive revision of the whole work, and much new material has been added. The type has been reset, so that much more matter is contained on a typical page; even so, the number of pages has been increased by [illegible] Changes have been made in the expository text, illustrations, literature references and tables, and the general level of the discussion has been raised somewhat.

COMPTON, ARTHUR H. AND SAMUEL K. ALLISON

X-rays in theory and experiment, second edition of *X-rays and electrons* by Arthur H. Compton. Princeton D. Van Nostrand and Company Inc., 1935 828 p. illus. 23 cm. $15.00. 969

Contents: The discovery and properties of X-rays. The production of X-rays. The scattering of X-rays. Dispersion theory applied to X-rays. The study of crystal structure by means of X-rays. The intensity of reflection of X-rays from crystals. Phenomena associated with the ejection of photo-electrons by X-rays. The interpretation of X-rays spectra. Some accurate methods of X-ray wavelength measurement and their results. Appendices. Author's index. Subject index.

Note: Long recognized as the standard reference book in its field, this work still has value, although portions of it are now out of date. It is an essentially complete presentation of the scientific knowledge pertaining to X-rays at the time of writing of the second edition (circa 1934).

KOLLER, LEWIS RICHARD

Ultraviolet radiation. New York John Wiley & Sons Inc., 1952 270 p. illus. 24 cm. $9.50 970

Contents: Introduction. Arcs. Incandescent sources of radiation. Solar radiation. Transmission. Reflection. Some applications and effects of ultraviolet. Detectors of ultraviolet radiation. Index.

Note: A general survey in which is incorporated a wide range of scientific and technical data. It is addressed primarily to persons who have some familiarity with technical terminology such as physicists, chemists, engineers, biologists, and even laymen. In the chapter on applications such uses of ultraviolet radiation as tanning of the skin, prevention of rickets, destruction of bacteria in air and water, and the production of fluorescence are discussed. The descriptions of lamps and other devices for producing ultraviolet radiation are limited to types rather than to particular equipment now being manufactured. Selected short lists of literature references are included. The author is a member of the staff of the General Electric Research Laboratory

LUCKIESH, MATTHEW

Applications of germicidal erythemal and infrared energy. Princeton D. Van Nostrand Company Inc. 1946 463 p. illus. 21 cm. $7.50 971

Contents: Challenging the sun. Sunlight and skylight. Erythema and tan. Units and terminology for biological effectiveness. Germicidal energy. Disinfecting controlled air. Infected communal air. Disinfecting air in occupied interiors. Disinfecting water. Artificial sunlight. Fading of materials. Ultraviolet energy and plant life. Radiant energy in common illuminants. Reflection and transmission. Measurement of ultraviolet energy. Various applications of radiant energy. References. Index.

Note: This work is concerned chiefly with the germicidal, biological, and therapeutic properties of ultraviolet energy, but only as regards the physics and mechanics of the subject. Thus there are chapters which describe the construction and properties of various types of sun lamps, and discussions of the amount of energy required to produce erythema and tan, but the biological and medical explanations of this reaction are referred to only in passing. The work is largely a presentation of scientific data, but it is written so that it can be understood by the lay reader. A 10-page bibliography is included.

SPROULL, WAYNE TREBER

X-rays in practice. New York McGraw Hill Book Company Inc., 1946 615 p. illus. 23 cm. $8.00 972

Contents (abridged): History of X-rays. Fundamentals of X-ray tubes. Characteristic X-ray spectra. Absorption and scattering. Refraction of X-rays and their diffraction by ruled gratings. X-ray generating equipment. X-ray detection, measurement, and registration. Protection. X-rays in the medical field (radiology). Industrial radiography. Laws of X-ray diffraction in a crystal. The Bragg method of crystal analysis and some pertinent properties of actual crystals. The Laue method, the rotation method, and other methods for a single crystal. The Hull-Debye-Scherrer powder method. Chemical analysis by X-ray diffraction. The measurement of stress and strain by X-ray diffraction. X-ray diffraction by amorphous solids, liquids, and gases. Electron diffraction and its applications. Appendix. Index.

Note: A rather thorough exposition of X-ray principles and research techniques. It is organized as a textbook with the usual questions and problems, but it is written on a level that will attract engineers and scientists who, though not X-ray specialists, need a scientific understanding of the subject. Mathematics is freely used in the exposition. Related literature is cited in footnotes, thus enhancing the book's reference value.

ELECTRICITY AND MAGNETISM

BOAST, WARREN B.

Principles of electric and magnetic fields. Second edition. New York Harper & Brothers, 1956 418 p. illus. 24 cm. $6.00. 973

Contents: Part I, Basic electric fields: Electric fields caused by concentrated charges in fixed positions. General relations in static electric fields. Electric fields with spherical boundaries. Electric fields caused by line lines of charge. Electric fields with cylindrical boundaries. Electric fields with essentially plane boundaries. Method of images applied to electric fields close to conducting planes. Capacitance concepts in multiple-conductor systems. Part II, Basic magnetic fields: General magnetic effects. Magnetic fields caused by line lines of current. Magnetic fields with cylindrical boundaries. The solenoid, toroid, and other simple geometric shapes. Flux linkage relations in systems of many parallel wires. Part III, Other aspects of electric and magnetic fields: Graphic construction of equipotentials and elements of flux plotting. Estimating capacitance and permeance of three-dimensional systems from probable flux paths. Permanent magnets. Transient response

rules and intensities. Potential functions. Methods of solving the secular determinant. A sample vibrational analysis—the benzene molecule. The separation of rotation and vibration. Appendices. Index.

Note A graduate-level textbook designed to teach the understanding and analysis of data supplied by infrared and Raman spectra of polyatomic molecules. The authors point up the importance of such spectra by stating that their results are useful in the study of (1) the forces between the atoms of a molecule (2) determinations of molecular structure, and (3) calculations of thermodynamic quantities. The early chapters are essentially descriptive and patient, explicit exposition is characteristic of the whole main part. Although mathematical symbols and equations are used freely in this part, the most difficult mathematics and derivations are reserved for the appendix, which accounts for 86 of the volume pages. A helpful feature is the inclusion as footnotes of citations of original papers pertaining to specific concepts and methods.

LUMINESCENCE

American Physical Society Division of Electron Optics

Preparation and characteristics of solid luminescent materials Symposium held at Cornell University October 24–26, 1946, sponsored by The Division of Electron Optics of The American Physical Society Published under the auspices of The National Research Council New York John Wiley & Sons Inc, 1948 459 p illus 22 cm. $10 00 964

Contents Foreword, by Lloyd P Smith. General characteristics and methods of preparation Luminescent crystals, by F Seitz. The preparation of sulfide and selenide phosphors, by R. Ward. The preparation of phosphors containing oxygen and fluorine by H. C. Froelich. The constitution and structure of phosphors, by G R. Fonda. Recent developments in theory and experiment: Some studies of electron traps in phosphors, by G F J Garlick. Storage and release of light by phosphors, by F Urbach. Infrared-sensitive phosphors, by B. O'Brien. Excitation and emission phenomena in phosphors, by H W Leverenz. Factors affecting fluorescence characteristics The fluorescence of cadmium sulfide, by J K. Inman, A. M. Moss, and W A. Weyl. Photoluminescence of some sulfide phosphors as a function of intensity by N R. Nail, D Pearlman, and F Urbach. Zinc Cadmium-sulfide Selenide phosphors, Part I Synthesis and constitution, by H. W Leverenz, E. J Wood, S. Lasof and R. E. Shrader Part II Photoluminescence and cathodoluminescence as a function of temperature crystal structure diffuse reflectivity and photolysis, by S. Lasof, R. E. Shrader and H. W Leverenz. Part III Spectral emission characteristics and relative intensities, by R. E. Shrader S. Lasof and H W Leverenz. Effect of temperature on the spectral energy distribution of several phosphors, by F J Studer and L. Olsen. The influence of temperature upon the intensity of luminescence of various phosphors, by L. Thorington. Storage of luminescence energy Absorption, storage and release of light by infrared-sensitive phosphors, by F Urbach H. Hemmendinger and D Pearlman Induction and decay of luminance as a function of excitation, by W B Nottingham. Measurement of brightness decay of phosphorescent materials, by R. P Tarle The decay of infrared-sensitive phosphors, by R. T Ellickson and W L. Parker The mechanism of rate processes in the luminescence of solids, by F E. Williams. Stimulation of some zinc sulfide phosphors, by D Pearlman, N R. Nail and F Urbach. Miscellaneous aspects of fluorescence The photochemical effect of short ultraviolet radiation on phosphors, by O. Meister and R. Nagy The reactivation of sulfide phosphors below formation temperature, by D T Wilber Multiple bands in the fluorescence spectra of singly activated phosphors, by G R. Fonda and H. C. Froelich. Correlation of the structure of various phosphors, by R. Nagy The luminescence of zinc beryllium silicate and of other manganese-activated phosphors, by J H. Schulman. The fluorescent efficiency of calcium tungstate under X-ray excitation by J W Coltman. Some observations on light absorption of powdered luminescent materials, by F H. Nicoll. The print-out effect and its use in the study of the motions of electrons in silver-halide crystals in an electric field, by J R. Haynes. Luminescence—experiment and others. Significance of paramagnetism, by S. Dunkman, F Seitz. Luminescence and purity of materials, by H. W Leverenz and others. Significance of paramagnetism, by S. Dunkman, F Seitz, and F Urbach Scope and limitations of energy diagrams, by W B Nottingham, F Seitz, and G F J Garlick. Characteristics and possible mechanisms of luminescence by P Pringsheim and others.

Note. The papers collected here provide a comprehensive survey of current knowledge of the subject. They are intended mainly for graduate physicists and other research workers with equivalent training. There are some citations to pertinent literature, but no prepared bibliography and unfortunately no index.

De Ment, Jack

Fluorochemistry, a comprehensive study embracing the theory and applications of luminescence and radiation in physicochemical science. New York Chemical Publishing Company, Inc., 1945 796 p illus. 22 cm. $14 50 965

Contents Part I, Fluorochemistry in theory Physical aspect of luminescence Physicochemical aspects of luminescence. Part II, "Homogeneous" luminescent systems The luminescent organic substances. The luminescent dyestuffs and coloring matters. Part III, "Heterogeneous" luminescent systems The phosphor medium—quasichemical systems. The synthetic, crystalline, inorganic phosphors. The synthetic vitreous phosphors—glasses. The organic phosphors and luminescent plastics. The natural phosphors—luminescent minerals. Part IV Ultraluminescence and infraluminescence Ultraviolet emitting substances. The ultraviolet emitting inorganic substances. The ultraviolet emitting organic and metal-organic substances. Fluorescent gamma and X-radiation. Fluorescent infrared radiation. Part V Fluorochemistry and fluorobiology Aspects of fluorobiology Appendices. Author index. Subject index.

Note A full treatment of the physics and chemistry of fluorescence and fluorescent substances based on a comprehensive survey of the literature and on the author's own researches. It is somewhat marred by errors and an uncritical selection of material; hence it must be used with caution. Important contributions are made to the theoretical aspects, and a large amount of information is included on practical applications, including applications in biology and medicine. Bibliographies and glossaries are included. Patents are listed in several of the bibliographies.

Leverenz, Humboldt Walter

An introduction to luminescence of solids. New York John Wiley & Sons, Inc., 1950. 569 p illus 24 cm $16 00 966

Contents The elements of matter and luminescence. Solids (crystals) Syntheses of luminescent solids (phosphors) Constitution, structures, and energy levels of phosphors. Luminescence of phosphors. General properties of phosphors (résumé of useful phosphors) Uses of phosphors. Appendixes. Preparation of pure ZnS, CdS, and ZnSe. Proportions of isolated and structurally adjacent impurity atoms, assuming a random distribution. Interconversion of some units of luminescence (surface brightness) General spectral characteristics of luminescence (radiance) Summary of some magnitudes and structures involved in the luminescence of solids. References. Formula index. Name index. Subject index.

Note A systematic and inclusive presentation of theoretical and practical information on phosphors. It has been written for such persons as graduate physicists who are beginning to work in the field and for other nonspecialists who are familiar with basic physical concepts. The text is compact and is keyed to the bibliography which runs to 730 references. The author is associated with the RCA Laboratories and has himself made important contributions to the basic knowledge of the field.

Pringsheim, Peter

Fluorescence and phosphorescence. New York Interscience Publishers, Inc. 1949 794 p. illus 24 cm $18 00 967

Contents Introduction General theory Experimental technique Part I, Fluorescence of gases and vapors Monatomic gases and vapors. Diatomic gases and vapors. Polyatomic gases and vapors. Part II Fluorescence and phosphorescence of condensed systems General survey Fluorescence of organic compounds Luminescence of pure inorganic compounds. Crystal phosphors Bibliography Author index. Reference number index. Subject index.

Note A comprehensive technical survey of photoluminescence It does not cover technical applications but theory experimental techniques, and physical data are fully covered In addition to the narrative text, there are 140 tables of data and 119 figures, many of which are graphs relating to spectra, etc. There are more than 7,000

lished literature, has been revised and expanded from doctoral thesis presented to the Department of Physics of Princeton University in 1930. The development of the knowledge of the subject is outlined, and the various published theories are reviewed. The theoretical discussions are directly related to the behavior of barium filaments, and an electronic theory developed by the author is explained. The list of references is extensive, and covers book and journal literature published to December 1931.

LOEB, LEONARD BENEDICT

Fundamentals of electricity & magnetism. Third edition. New York John Wiley & Sons Inc., 194 669 p. illus 24 cm. $7.00. 980

Contents (abridged): Historical. The quantitative treatment of magnetic forces. The absolute determination of pole strength and magnetic fields. Electric currents. Potential difference and work in an electric circuit. Generalization of Ohm's law. Liquid conductors—electrolysis—batteries. Thermoelectricity. Static electricity—charges and fields—potential—capacity. Electromagnetism. Magnetic properties of materials. Induced electric currents. Simple dynamos and motors. Induction. Electrical and magnetic measurements. Alternating currents. The units of electromagnetic and electrostatic units, Maxwell's equations and electromagnetic waves, and the character of electrical units and their dimensions. Discharge through gases and atomic structure. Photoelectric and thermionic effects. Problems. Name index. Subject index.

Note: A college textbook that is designed to give engineering and science students an unusually thorough grounding in the electrical part of basic physics. It is intended for use in basic courses, and the material is more advanced and requires more knowledge of mathematics than is usual in undergraduate textbooks. Subject matter and its arrangement in the present edition are the same as in the previous edition (1938), but there are 115 additional pages which include revisions and new material dealing with modern constructions, the betatron, synchrotron, magnetron, klystron, UHF wave generation, and the principles of ferromagnetism.

MASON, MAX, AND WARREN WEAVER

The electromagnetic field. New York Dover Publications, Inc., 1952 390 p. illus. 21 cm. $2.00 981

Contents: Coulomb's law and some analytic consequences. The electrostatic problem for conductors and dielectrics. Magnetostatics. The Maxwell field equations. Problems for Chapter IV. Corrections to Chapter IV. Mathematical appendix. Table for change of units. Formula index. Subject index.

Note: Originally a textbook for advanced students of physics, electrical engineering, communications engineering, etc., this work has continued to find readers both among enrolled students and graduate scientists since its original publication in 1929. It is written in terms of vector analysis. This edition is reprinted without change in the text of the original edition.

PAGE, LEIGH, AND NORMAN ILSLEY ADAMS JR.

Principles of electricity: an intermediate text in electricity and magnetism. Second edition. Princeton D. Van Nostrand Company Inc., 1949 619 p. illus. 22 cm. (University physics series. Leigh Page consulting editor) $7.25 982

Contents: Fundamental laws of electrostatics. Dielectrics and conductors. Solution of electrostatic problems. Magnetostatics. Steady currents. Chemical and thermal effects. Magnetic field of currents. Motion of ions in electric and magnetic fields. Electromagnetic induction. Interactions of currents and fields. Flux measurements. Absolute standards and units. Alternating currents. Measurements with varying currents. Coupled circuits. Filters and lines. Electromagnetic waves. High-frequency oscillations. Index.

Note: As this text is intended for use in undergraduate second-year physics courses, the treatment presupposes knowledge of elementary physics and calculus. More advanced mathematical concepts are explained in the text as needed. The treatment is considerably more analytical than in introductory texts. The first edition published in 1931 was reprinted many times without revision. The present edition, although unchanged in scope and general arrangement, has now been revised to include new material on such topics as the cyclotron, betatron, and wave guide.

PANOFSKY, WOLFGANG K. H., AND MELBA PHILLIPS

Classical electricity and magnetism. Reading Mass Addison-Wesley Publishing Company 1955 400 p. illus. 24 cm. $8.50. 983

Contents: The electrostatic field in vacuum. Boundary conditions and relation of microscopic to macroscopic fields. General methods for the solution of potential problems. Two-dimensional potential problems. Three-dimensional potential problems. Energy relations and forces in the electrostatic field. Currents and their interactions. Magnetic materials and boundary value problems. Maxwell's equations. Energy, force, and momentum relations in the electromagnetic field. The wave equation and plane waves. Wave solutions in the presence of metallic boundaries. The inhomogeneous wave equation. The experimental basis for the theory of special relativity. Relativistic kinematics and the Lorentz transformation. Covariance and relativistic mechanics. Covariant formulation of vacuum electrodynamics. The Liénard-Wiechert potentials and the field of a uniformly moving electron. Radiation from an accelerated charge. Radiation reaction. Radiation, scattering, and dispersion. Covariant formulation of the field equations in material media and the conservation laws of electrodynamics. The motion of charged particles in electromagnetic fields. Hamiltonian formulation of Maxwell's equations. Appendices: Units and dimensions in electromagnetic theory. Vector relations in curvilinear coordinates. Bibliography. Index.

Note: A graduate-level text developed from lectures given by the first-named author at the University of California and Stanford University. It is intended as preparation for research work and teaching in physics and related fields, such as mathematical physics. The exposition is expressed in the concepts of field theory and is designed to relate classical electricity and magnetism to modern physics. Readers will need considerable knowledge of mathematics, including advanced calculus and vector analysis.

SCHELKUNOFF, SERGEI ALEXANDER

Electromagnetic waves. New York D. Van Nostrand Company, Inc., 1943 530 p. illus. 23 cm. $10.50 984

Contents: Vectors and coordinate systems. Mathematics of oscillations and waves. Bessel and Legendre functions. Fundamental electromagnetic equations. Impedance, transmission, networks. About waves in general. Transmission theory. Waves, wave guides and resonators. Radiation and diffraction. Antenna theory. The impedance concept.

Note: A discussion of the subject for scientists and engineers. The circuit theory, the transmission line theory, and the field theory are treated as subdivisions of one inclusive theory. Mathematics is used freely, but the main emphasis is upon physics. The book was developed from lectures delivered to staff members of the Bell Telephone Laboratories in New York.

SHEDD, PAUL C

Fundamentals of electromagnetic waves. New York Prentice-Hall, Inc., 1954 191 p. illus. 23 cm. (Prentice-Hall Electrical engineering series. W. L. Everitt, editor) $5.65 985

Contents: Vector algebra. Differentiation and integration. Fundamentals of mechanics. Fundamental postulates and restrictions. The fundamental law. Gauss's law. Polarization. Properties of dielectrics. Electrical scalar potential. The divergence theorem. Stokes' theorem. Curvilinear coordinates. Field and potential equations. Solutions of Laplace's equation. Images. Conjugate functions. Electric current. Principles of relativity. Moving electric field. Ampère's law. The magnetic field. Magnetism. Changing-flux theorem. Maxwell's field equations. Energy relations. Electric circuits. Maxwell wave equations. Retarded potentials. Electromagnetic fields in waveguides. Properties of waveguides. Impedance and power in waveguides. Antennas. Appendix. References. Problems. Index.

Note: A mathematical exposition designed for use by senior undergraduate and first-year graduate students. In the first 11 chapters, electromagnetic field theory is developed as a logical system capable of complete expression in the terms of mathematics. In the last four chapters, applications of the theory of waveguides and antennas are illustrated. The student or reader will need prior knowledge of elementary calculus. The book is self-contained for higher mathematics such as vector algebra.

in simple resistance-capacitance systems. Transient response in simple resistance-inductance systems. Measurements of electric charge and magnetic flux with the ballistic galvanometer and the fluxmeter Initial and ultimate conditions in resistance-capacitance-inductance systems. Maxwell's field equations. Appendix. Index.

Note. The fundamental phenomena and theory of electric and magnetic fields are presented at an elementary level in this textbook designed for advanced undergraduate college students. Calculus is used throughout the book, and knowledge of elementary electric circuit theory is necessary for comprehension of the chapters in the third part. The first edition was published in 1948 There have been some reorganization and revision of material, and the terminal *chapter on Maxwell's field equation,* has been added in this second edition.

BOZORTH, RICHARD MILTON

Ferromagnetism Princeton D Van Nostrand Company, Inc, 1951 986 p illus 24 cm (Bell Telephone Laboratories series) $20 00 974

Contents (abridged) Part I Introduction Concepts of ferromagnetism. Factors affecting magnetic quality Part II. Magnetic properties of materials Technical and pure iron. Iron-silicon alloys. Iron-nickel alloys. Iron-cobalt alloys. Other high permeability materials. Permanent magnets. Part III Magnetic phenomena and theories The magnetization curve and the domain theory Magnetic properties of crystals. Stress and magnetostriction. Temperature and the Curie point. Change of magnetization with time. Special problems in domain theory Part IV Measurements. Appendixes Some physical properties of the elements. Values of some constants. Magnetic properties of various materials. Bibliography Name index. Subject index.

Note A substantial treatise covering the modern knowledge of magnetic phenomena and magnetic materials, addressed to graduate physicists and engineers. The bibliography alone runs to 72 pages. The author is member of the technical staff of Bell Telephone Laboratories, Inc.

FOWLER, R. G

Introduction to electric theory Reading, Mass. Addison Wesley Publishing Company, 1953 390 p illus 24 cm $8 50 975

Contents The electrostatic field in vacuum. Energy relations in the electrostatic field in vacuum. Electrostatic fields and matter Electrostatic fields in matter Electric charges in motion. Magnetic fields and magnetic materials. The magnetic field of current. Electromagnetic forces and electromagnetic induction. Stress and energy in the electromagnetic field. Electrical properties of matter Theory of linear circuits bearing constant currents. Theory of time-changing currents in linear circuits. Theory of periodic currents in linear circuits. Electromagnetic radiation. Units in electricity List of symbols. Answers to problems. Index.

Note A college textbook designed for upperclass undergraduate students who have completed courses in introductory physics, analytic geometry and calculus. The author states, "My object has not been to teach all about electricity but to build a framework of methods, quantities and attitudes from which larger knowledge can easily be fitted at will and as needed. Nevertheless, the reader is given broad view of current ideas in such fields as electromagnetism. The final chapter contains a compact presentation of Maxwell' equations, together with illustrations of their uses in solving typical problems in electromagnetic radiation.

FRANK, NATHANIEL HERMAN

Introduction to electricity and optics. Second edition New York McGraw Hill Book Company, Inc., 1950 440 p illus. 24 cm $6 50 976

Contents Fields of force. The electrostatic field of force. The sources of the electrostatic field. Induced charges and capacity Steady electric currents. The magnetic field of force. The magnetic field of steady currents. Induced electromotive forces and inductance Elementary alternating-current circuits Displacement current and electromagnetic waves. Radiation of electromagnetic waves Electronic conduction in vacuum and in metals. Dielectrics. Magnetic properties of matter Electromagnetic waves in material bodies. Geometrical optics and simple optical instruments. Dispersion and scattering. Interference. Diffraction. Heat radiation. Appendixes. Index.

Note This college text, based on courses given at Massachusetts Institute of Technology is designed for the use of second-year students majoring in electrical engineering or physics. Emphasis is on fundamental laws and theories and methods of application in the study of currents, electric and magnetic properties of matter and optics. The general scope and content of the revision remain the same, but the material has been expanded and rewritten to provide fuller discussions of such topics as field of force, parallel c. circuits, interference, and diffraction.

GILBERT, NORMAN EVERETT

Electricity and magnetism. Third edition. New York The Macmillan Company, 1950 269 p illus 21 cm $6 75 977

Content (abridged) Electricity and the electrostatic field. Magnets and the magnetic field. Potential. Capacity Theory of dielectrics. Atmospheric electricity Measurement of current. Resistance and its measurement. Measurement of potential. Electrolytic conduction and batteries. Direct-current dynamo machines. Measurement of inductance and capacity Alternating-current networks. Alternators—generators and motors. Transformers. Transmission and distribution of power Conduction in gases. Electrons, photons, and positive ions. Thermionic electron tubes. Electrical communication. Thermoelectricity Radioactivity and the structure of matter Units and dimensions. Index.

Note. A textbook for engineering college students who are not specializing in electrical engineering. It is more comprehensive than many of the texts planned for such students, but it is neither so full nor so difficult as textbooks intended for the use of physics majors and engineering students. In the present edition new material has been added on such topics as the betatron, chain atomic reactions, plutonium the source of the sun's heat, and the symbolic method of treating alternating-current networks. Altogether, the changes do not add up to an extensive revision.

HARNWELL, GAYLORD PROBASCO

Principles of electricity and electromagnetism. Second edition New York McGraw Hill Book Company Inc., 1949 670 p illus. 24 cm. (International series in pure and applied physics G P Harnwell consulting editor) $8 50 978

Contents Electrostatics. Electrostatic energy and dielectrics. Physical characteristics of dielectrics and conductors. Direct-current circuits. Nonohmic circuit elements and alternating currents. Chemical, thermal, and photoelectric effects. Thermionic vacuum tubes. Electrical conduction in gases. Electromagnetic effects of steady currents. Changing electric currents and electromagnetic reactions. Magnetic properties of matter Electromagnetic machinery Simple circuits containing inductance, capacitance and resistance. Coupled circuits, filters and lines. Vacuum tube circuits. Radiation. Mathematical appendix. Index.

Note An established textbook for use in intermediate college courses offered to students who have completed course in basic physics. It is designed as an introduction to both experimental and theoretical electricity but there is somewhat more emphasis on the experimental and mathematical aspects than on the theoretical. Changes in the present edition reflect advances in nuclear physics and in electronics. There are new or expanded discussions of such developments as radar wave guides, and high-energy electromagnetic ion accelerators. In addition to its use as text, the book has more value as reference manual on advanced experimental techniques.

JAYNES, E T

Ferroelectricity Princeton Princeton University Press 1953 137 p illus 23 cm. (Investigations in physics edited by Eugene Wigner and Robert Hofstadter No 1) $2 00 979

Content Historical introduction and review of experimental facts. Review of theories of $BaTiO_3$. Thermodynamic treatment Internal fields in crystals. Electric polarization in crystals. Appendixes. References. Index

Note The term ferroelectricity" is due to certain similarities between the group of phenomena designated by it and magnetic phenomena, such phenomena as hysteresis and abrupt changes in characteristic reminiscent of the Curie point. This book, intended as general introduction to the subject and guide to the pub-

[illegible] literature, has been revised and expanded from [illegible] doctoral thesis presented to the Department of Physics of Princeton University in 1932. The development of the knowledge of the subject is outlined, and the various published theories are reviewed. The theoretical derivations are directly related to the behavior of [illegible] [illegible], and an electronic theory developed by the author is explained. The list of references is extensive, and covers book and journal literature published to December 1931.

LOEB LEONARD BENEDICT

Fundamentals of electricity & magnetism. Third edition. New York John Wiley & Sons Inc., 1947 669 p. illus. 24 cm. $7.00 980

Contents (abridged) Historical. The quantitative treatment of magnetic forces. The absolute determination of pole strength and magnetic fields. Electric currents. Potential difference and work in an electric circuit. Generalization of Ohm law. Liquid conductors—electrolysis—batteries. Thermoelectricity. Static electricity—charges and fields—potential—capacity. Electromagnetism. Magnetic properties of materials. Induced electric currents. Simple dynamos and motors. Inductance. Electrical and magnetic measurements. Alternating currents. The ratio of electromagnetic and electrostatic units. Maxwell's equations and electromagnetic waves, and the character of electrical units and their dimensions. Discharge through gases and atomic structure. Photoelectric and thermionic effects. Problems. Name index. Subject index.

Note A college textbook that is designed to give engineering and science students an unusually thorough grounding in the electrical part of basic physics. It is intended for use in long courses, and the material is more advanced and requires more knowledge of mathematics than is usual in undergraduate textbooks. Subject matter and its arrangement in the present edition are the same as in the previous edition (1938) but there are 113 additional pages which include problems and new material dealing with nuclear constitution, the betatron, synchrotron, magnetron, klystron, UHF wave generation, and the principles of [illegible].

MASON MAX, AND WARREN WEAVER

The electromagnetic field. New York Dover Publications, Inc., 1952 390 p. illus. 21 cm. $2.00. 981

Contents. Coulomb's law and some analytic consequences. The electrostatic problem for conductors and dielectrics. Magnetostatics. The Maxwell field equations. Problems for Chapter IV. Contribution to Chapter IV. Mathematical appendix. Table for change of units. Formula index. Subject index.

Note Originally [illegible] textbook for advanced students of physics, electrical engineering, communications engineering, etc., this work has continued to find readers both among enrolled students and graduate scientists since its original publication in 1929. It is written in terms of vector analysis. This edition is [illegible] reprint without change in the text of the original edition.

PAGE, LEIGH AND NORMAN ILSLEY ADAMS JR.

Principles of electricity an intermediate text in electricity and magnetism. Second edition. Princeton D Van Nostrand Company Inc., 1949 619 p. illus. 22 cm. (University physics series Leigh Page, consulting editor) $7.25 982

Contents Fundamental laws of electrostatics. Dielectrics and conductors. Solution of electrostatic problems. Magnetostatics. Steady currents. Chemical and thermal effects. Magnetic field of [illegible] currents. Motion of ions in electric and magnetic fields. Electromagnetic induction. Interaction of currents and fields. Flux measurements. Absolute standards and units. Alternating currents. Measurements with varying currents. Coupled circuits. Skin and lines. Electromagnetic waves. High-frequency oscillations. Index.

Note As this text is intended for use in undergraduate [illegible] year physics courses, the treatment presupposes [illegible] knowledge of elementary physics and calculus. More advanced mathematical concepts are explained in the text as needed. The treatment is considerably more analytical than in introductory texts. The first edition published in [illegible] 931 was reprinted many times without revision. The present edition, although unchanged in scope and general arrangement, has now been revised to include new material on such topics as the cyclotron, betatron, and wave guide.

PANOFSKY WOLFGANG K. H. AND MELBA PHILLIPS

Classical electricity and magnetism. Reading Mass. Addison Wesley Publishing Company 1955 400 p. illus. 24 cm. $8.50 983

Contents The electrostatic field in vacuum. Boundary conditions and relation of microscopic to macroscopic fields. General methods for the solution of potential problems. Two-dimensional potential problems. Three-dimensional potential problems. Energy relations and forces in the electrostatic field. Currents and their interactions. Magnetic materials and boundary value problems. Maxwell equations. Energy, force, and momentum relations in the electromagnetic field. The wave equation and plane waves. Wave solutions in the presence of metallic boundaries. The inhomogeneous wave equation. The experimental basis for the theory of special relativity. Relativistic kinematics and the Lorentz transformation. Covariance and relativistic mechanics. Covariant formulation of vacuum electrodynamics. The Liénard-Wiechert potentials and the field of a uniformly moving electron. Radiation from an accelerated charge. Radiation reaction. Radiation, scattering, and dispersion. Covariant formulation of the field equations in material media and the conservation laws of electrodynamics. The motion of charged particles in electromagnetic fields. Hamiltonian formulation of Maxwell equations. *Appendices* Units and dimensions in electromagnetic theory. Vector relations in curvilinear coordinates. Bibliography. Index.

Note A graduate-level text developed from lectures given by the first-named author at the University of California and Stanford University. It is intended as preparation for research work and teaching in physics and related fields, such as mathematical physics. The exposition is expressed in the concepts of [illegible] field theory and is designed to relate classical electricity and magnetism to modern physics. Readers will need considerable knowledge of mathematics, including advanced calculus and vector analysis.

SCHELKUNOFF, SERGEI ALEXANDER

Electromagnetic waves. New York D Van Nostrand Company Inc., 1943 530 p. illus. 23 cm. $10.50 984

Contents Vectors and coordinate systems. Mathematics of oscillations and waves. Bessel and Legendre functions. Fundamental electromagnetic equations. Impedance, transformers, networks. Along waves in general. Transmission theory. Waves, wave guides and resonators. Radiation and diffraction. Antenna theory. The impedance concept.

Note A discussion of the subject for scientists and engineers. The circuit theory, the transmission line theory, and the field theory are treated as subdivisions of one inclusive theory. Mathematics is used freely but the main emphasis is upon physics. The book was developed from lectures delivered to staff members of the Bell Telephone Laboratories in New York.

SHEDD PAUL C.

Fundamentals of electromagnetic waves. New York Prentice-Hall, Inc., 1954 191 p. illus. 23 cm. (Prentice-Hall Electrical engineering series W. L. Everitt, editor) $5.65 985

Contents Vector algebra. Differentiation and integration. Fundamentals of mechanics. Fundamental postulates and restrictions. The fundamental law. Gauss' law. Polarization. Properties of dielectrics. Electrical scalar potential. The divergence theorem. Stokes's theorem. Curvilinear coordinates. Field and potential equations. Solutions of Laplace's equation. Images. Conjugate functions. Electric current. Principles of relativity. Moving electric field. Ampère's law. The magnetic field. Magnetism. Counting-line theorem. Maxwell field equations. Energy relations. Electric circuits. Maxwell wave equations. Retarded potentials. Electromagnetic fields in waveguides. Properties of waveguides. Impedance and power in waveguides. Antennas. Appendix. References. Problems. Index.

Note A mathematical exposition designed for use by senior undergraduate and first-year graduate students. In the first 31 chapters, electromagnetic field theory is developed as [illegible] logical system capable of complete expression in the terms of mathematics. In the four final chapters, applications of the theory of waveguides and antennas are illustrated. The student or reader will need [illegible] prior knowledge of elementary calculus. The book is self-contained for higher mathematics such as vector algebra.

in simple resistance-capacitance systems. Transient response in simple resistance-inductance systems. Measurements of electric charge and magnetic flux with the ballistic galvanometer and the fluxmeter. Initial and ultimate conditions in resistance-capacitance-inductance systems. Maxwell's field equations. Appendix. Index.

Note: The fundamental phenomena and theory of electric and magnetic fields are presented at an elementary level in this textbook designed for advanced undergraduate college students. Calculus is used throughout the book, and a knowledge of elementary electric circuit theory is necessary for comprehension of the chapters in the third part. The first edition was published in 1945. There have been some reorganization and revision of material, and the terminal chapter on Maxwell's field equation, has been added in this second edition.

BOZORTH, RICHARD MILTON

Ferromagnetism Princeton D Van Nostrand Company, Inc., 1951 986 p illus 24 cm. (Bell Telephone Laboratories series) $20 00 974

Contents (abridged) Part I, Introduction Concepts of ferromagnetism. Factors affecting magnetic quality Part II, Magnetic properties of materials Technical and pure iron. Iron-silicon alloys. Iron-nickel alloys. Iron-cobalt alloys. Other high permeability materials. Permanent magnets. Part III, Magnetic phenomena and theories The magnetization curve and the domain theory Magnetic properties of crystals. Stress and magnetostriction Temperature and the Curie point. Change of magnetization with time. Special problems in domain theory Part IV Measurements. Appendixes Some physical properties of the elements. Values of some constants. Magnetic properties of various materials. Bibliography Name index. Subject index.

Note. A substantial treatise covering the modern knowledge of magnetic phenomena and magnetic materials, addressed to graduate physicists and engineers. The bibliography alone runs to 71 pages. The author is a member of the technical staff of Bell Telephone Laboratories, Inc.

FOWLER, R. G

Introduction to electric theory Reading, Mass Addison Wesley Publishing Company 1953 390 p illus 24 cm $8 50 975

Contents: The electrostatic field in vacuum. Energy relations in the electrostatic field in vacuum. Electrostatic fields and matter Electrostatic fields in matter Electric charges in motion. Magnetic fields and magnetic materials. The magnetic field of a current. Electromagnetic forces and electromagnetic induction. Stress and energy in the electromagnetic field. Electrical properties of matter Theory of linear circuits bearing constant currents. Theory of time-changing currents in linear circuits. Theory of periodic currents in linear circuits. Electromagnetic radiation. *Units in electricity* List of symbols. Answers to problems. Index.

Note A college textbook designed for upperclass undergraduate students who have completed courses in introductory physics, analytic geometry and calculus. The author states, "My object has not been to teach all about electricity but to build a framework of methods, quantities and attitudes from which a larger knowledge can easily be fitted at will and as needed." Nevertheless, the reader is given a broad view of current ideas in such fields as electromagnetism. The final chapter contains a compact presentation of Maxwell's equations, together with illustrations of their uses in solving typical problems in electromagnetic radiation.

FRANK, NATHANIEL HERMAN

Introduction to electricity and optics Second edition New York McGraw Hill Book Company, Inc., 1950 440 p illus. 24 cm $6 50 976

Contents: Fields of force. The electrostatic field of force. The sources of the electrostatic field. Induced charges and capacity Steady electric currents. The magnetic field of force. The magnetic field of steady currents. Induced electromotive forces and inductance Elementary alternating-current circuits. Displacement current and electromagnetic waves. Radiation of electromagnetic waves. Electronic conduction in vacuum and in metals. Dielectrics. Magnetic properties of matter Electromagnetic waves in material bodies. Geometrical optics and simple optical instruments. Dispersion and scattering. Interference. Diffraction Heat radiation. Appendixes. Index.

Note This college text, based on courses given at Massachusetts Institute of Technology is designed for the use of second-year students majoring in electrical engineering or physics. Emphasis is on fundamental laws and theories and methods of application in the study of currents, electric and magnetic properties of matter and optics. The general scope and content of the revision remain the same, but the material has been expanded and rewritten to provide fuller discussions of such topics as field of force, parallel a.c. circuits, interference, and diffraction.

GILBERT, NORMAN EVERETT

Electricity and magnetism Third edition. New York The Macmillan Company, 1950 269 p illus 21 cm $6 75 977

Contents (abridged) Electricity and the electrostatic field. *Magnets and the magnetic field. Potential. Capacity Theory of dielectrics.* Atmospheric electricity Measurement of current. Resistance and its measurement. Measurement of potential. Electrolytic conduction and batteries. Direct-current dynamo machines. Measurement of inductance and capacity Alternating-current networks. Alternators—generators and motors. Transformers. Transmission and distribution of power Conduction in gases. Electrons, photons, and positive ions. Thermionic electron tubes. Electrical communication. Thermoelectricity Radioactivity and the structure of matter *Units and dimensions.* Index.

Note A textbook for engineering college students who are not *specializing in electrical engineering. It is more comprehensive than many of the texts planned for such students,* but it is neither so full nor so difficult as textbooks intended for the use of physics majors and engineering students. In the present edition new material has been added on such topics as the betatron, chain atomic reactions, plutonium, the source of the sun's heat, and the symbolic method of treating alternating-current networks. Altogether the changes do not add up to an extensive revision.

HARNWELL, GAYLORD PROBASCO

Principles of electricity and electromagnetism Second edition New York McGraw Hill Book Company, Inc , 1949 670 p. illus. 24 cm. (International series in pure and applied physics G P Harnwell, consulting editor) $8 50 978

Contents. Electrostatics. Electrostatic energy and dielectrics. *Physical characteristics of dielectrics and conductors.* Direct-current circuits. Nonohmic circuit elements and alternating currents. Chemical, thermal, and photoelectric effects. Thermionic vacuum tubes Electrical conduction in gases. Electromagnetic effects of steady currents. Changing electric currents and electromagnetic reactions. Magnetic properties of matter Electromagnetic machinery Simple circuits containing inductance capacitance and resistance. Coupled circuits, filters and lines. Vacuum tube circuits. Radiation. Mathematical appendix. Index.

Note: An established textbook for use in intermediate college courses offered to students who have completed a course in basic physics. It is designed as an introduction to both experimental and theoretical electricity but there is somewhat more emphasis on the experimental and mathematical aspects than on the theoretical. Changes in the present edition reflect advances in nuclear physics and in electronics. There are new or expanded discussions of such developments as radar wave guides, and high-energy electromagnetic ion accelerators. In addition to its use as a text, the book has some value as a reference manual on advanced experimental techniques.

JAYNES, E T

Ferroelectricity Princeton Princeton University Press 1953 137 p. illus. 23 cm. (Investigations in physics edited by Eugene Wigner and Robert Hofstadter No 1) $2 00 979

Contents Historical introduction and review of experimental facts. Review of theories of $BaTiO_3$. Thermodynamic treatment Internal fields in crystals. Electric polarization in crystals. Appendixes. References. Index

Note The term "ferroelectricity" is due to certain similarities between the group of phenomena designated by it and magnetic phenomena, such phenomena as hysteresis and abrupt changes in characteristic reminiscent of the Curie point. This book, intended as a general introduction to the subject and a guide to the pub-

[illegible] [illegible], has been revised and expanded from [illegible] doctoral thesis presented to the Department of Physics at Princeton University in 1950. The development of the knowledge of the subject is outlined, and the various published theories are reviewed. The theoretical [illegible] are directly related to the behavior of [illegible] [illegible], and an electronic theory developed by the author is emphasized. The list of references is extensive, and covers book and journal literature published to December 1951.

LOEB, LEONARD BENEDICT

Fundamentals of electricity & magnetism. Third edition. New York John Wiley & Sons, Inc., 1947 669 p. illus. 24 cm. $7.00 980

Contents (abridged) [illegible]. The quantitative treatment of magnetic forces. The absolute determination of pole strength and magnetic fields. Electric currents. Potential difference and work in an electric circuit. Generalization of Ohm' law. Liquid conductors—electrolysis—batteries. Thermoelectricity. Static electricity—charges and fields—potential—capacity. Electromagnetics. Magnetic properties [illegible] materials. Induced electric currents. Simple dynamos and motors. Induction. Electrical and magnetic measurements. Alternating currents. The [illegible] of electromagnetic and electrostatic units. Maxwell' equations and electromagnetic waves, and the character of electrical units and their dimensions. Discharge through gases and atomic structure. Photoelectric and thermionic effects. Problems. Name index. Subject index.

Note: A college textbook that is designed to give engineering and science students an unusually thorough grounding in the electrical part of basic physics. It is intended for use in basic courses, and the material is more advanced and requires more knowledge of mathematics than is usual in undergraduate textbooks. Subject matter and its arrangement in the present edition are the same as in the previous edition (1938) but there are 115 additional pages which include revisions and new material dealing with [illegible] [illegible], the betatron, synchrotron, magnetron, klystron, [illegible] wave generation, and the principles of ferromagnetism.

MASON MAX, AND WARREN WEAVER

The electromagnetic field. New York Dover Publications Inc., 1952 390 p. illus. 21 cm. $2.00 981

Contents: Coulomb' law and some analytic consequences. The electrostatic problem for conductors and dielectrics. Magnetostatics. The Maxwell field equations. Problems for Chapter IV. Contributions to Chapter IV. Mathematical appendix. Table for change of units. Formula index. Subject index.

Note: Originally a textbook for advanced students of physics, electrical engineering, communications engineering, etc., this work has continued to find readers both among untutored students and [illegible] scientists since its original publication in 1929. It is written in terms of vector analysis. This edition is reprinted without change in the text of the original edition.

PAGE, LEIGH AND NORMAN ILSLEY ADAMS JR.

Principles of electricity an intermediate text in electricity and magnetism. Second edition. Princeton D Van Nostrand Company Inc., 1949 619 p. illus. 22 cm. (University physics series Leigh Page consulting editor) $7.25 982

Contents: Fundamental laws of electrostatics. Dielectrics and conductors. Solution of electrostatic problems. Magnetostatics. Steady currents. Chemical and thermal effects. Magnetic field of current. Motion of ions in electric and magnetic fields. Electromagnetic induction. Interaction of currents and fields. Flux measurements. Absolute standards and units. Alternating currents. Measurements with varying currents. Coupled circuits. Filters and lines. Electromagnetic waves. High-frequency oscillations. Index.

Note: As this text is intended for use in undergraduate second-year physics courses, the treatment presupposes knowledge of elementary physics and calculus. More advanced mathematical concepts are explained in the text as needed. The treatment is considerably more analytical than in introductory texts. The first edition, published in 1931, was reprinted many times without revision. The present edition, although unchanged in scope and general arrangement, has now been revised to include new material on such topics as the cyclotron, betatron, and wave fields.

PANOFSKY WOLFGANG K. H. AND MELBA PHILLIPS

Classical electricity and magnetism. Reading, Mass Addison Wesley Publishing Company 1955 400 p illus 24 cm $8.50 983

Contents: The electrostatic field in vacuum. Boundary conditions and relation of microscopic to macroscopic fields. General methods for the solution of potential problems. Two-dimensional potential problems. Three-dimensional potential problems. Energy relations and forces in the electrostatic field. Currents and their interaction. Magnetic materials and boundary value problems. Maxwell' equations. Energy, force, and momentum relations in the electromagnetic field. The wave equation and plane waves. Wave solutions in the presence of metallic boundaries. The inhomogeneous wave equation. The experimental basis for the theory of special relativity. Relativistic kinematics and the Lorentz transformation. Covariance and relativistic mechanics. Covariant formulation of vacuum electrodynamics. The Liénard-Wiechert potentials and the field of uniformly moving electron. Radiation from an accelerated charge. Radiation reaction. Radiation, scattering, and dispersion. Covariant formulation of the field equations in material media and the conservation laws of electrodynamics. The motion of charged particles in electromagnetic fields. Hamiltonian formulation. [illegible] Maxwell's equations. Appendices. Units and dimensions in electromagnetic theory. Vector relations in curvilinear coordinates. Bibliography. Index.

Note: A graduate-level text developed from lectures given by the first-named author at the University of California and Stanford University. It is intended as preparation for research work and teaching in physics and related fields, such as mathematical physics. The exposition is expressed in the concepts of field theory and is designed to relate classical electricity and magnetism to modern physics. Readers will need considerable knowledge of mathematics, including advanced calculus and vector analysis.

SCHELKUNOFF, SERGEI ALEXANDER

Electromagnetic waves. New York D Van Nostrand Company Inc., 1943 530 p. illus. 23 cm. $10.50 984

Contents: Vectors and coordinate systems. Mathematics of oscillations and waves. Bessel and Legendre functions. Fundamental electromagnetic equations. Impedors, transducers, networks. About waves in general. Transmission theory. Waves, wave guides and resonators. Radiation and diffraction. Antenna theory. The impedance concept.

Note: A discussion of the subject for scientists and engineers. The circuit theory, the transmission line theory, and the field theory are treated as subdivisions of one inclusive theory. Mathematics is used freely, but the main emphasis is upon physics. The book was developed from lectures delivered to staff members of the Bell Telephone Laboratories in New York.

SHEDD PAUL C.

Fundamentals of electromagnetic waves. New York Prentice-Hall, Inc., 1954 191 p. illus 23 cm. (Prentice-Hall Electrical engineering series W. L. Everitt, editor) $5.65 985

Contents: Vector algebra. Differentiation and integration. Fundamentals of mechanics. Fundamental postulates and restrictions. The fundamental law. Gauss's law. Polarization. Properties of dielectrics. Electrical scalar potential. The divergence theorem. Stokes' theorem. Curvilinear coordinates. Field and potential equations. Solutions of Laplace's equation. Images. Conjugate functions. Electric current. Principles of relativity. Moving electric field. Ampère's law. The magnetic field. Magnetism. Changing flux theorem. Maxwell' field equations. Energy relations. Electric circuits. Maxwell' wave equations. Retarded potentials. Electromagnetic fields in waveguides. Properties of waveguides. Impedance and power in waveguides. Antennas. Appendix. References. Problems. Index.

Note: A mathematical exposition designed for use by senior undergraduates and first-year graduate students. In the first 11 chapters, electromagnetic field theory is developed as a logical system capable of complete expression in the terms of mathematics. In the four final chapters, applications of the theory of waveguides and antennas are illustrated. The student or reader will need prior knowledge of elementary calculus. The book is self-contained for higher mathematics such as vector algebra.

SEARS, FRANCIS WESTON

Electricity and magnetism. Reading, Mass Addison Wesley Publishing Company, Inc., 1946 434, 14 p illus 23 cm $8 50 986

Contents Coulomb's law The electric field. Potential. Current, resistance, resistivity D C. circuits. Chemical and thermal EMF's. Properties of dielectrics. Capacitance and capacitors. The magnetic field. Galvanometers, ammeters, and volt meters—the D C. motor Magnetic field of current and of a moving charge. Induced electromotive force. Inductance. Magnetic properties of matter. Ferromagnetism. Alternating currents. Electrical oscillations and electromagnetic waves. Electronics. Suggested books for collateral reading. Index.

Note Originally published as part of the author's three-volume *Principles of physics*, this book provides a more mature exposition of electricity and magnetism than is common in introductory college texts. The level of treatment assumes that the readers will have grasp of elementary calculus and will have acquired considerable familiarity with physical terminology Rationalized mks units are used. The relatively advanced level notwithstanding, the expository text is carefully written and most points are discussed fully There are more than 300 illustrations.

SILSBEE, FRANCIS B

Extension and dissemination of the electrical and magnetic units by the National Bureau of Standards Washington, D C. Government Printing Office, 1952 33 p illus 26 cm. (United States National Bureau of Standards Circular 531) $0 25 987

Contents Introduction. Fundamentals. Derivation of other units. Transfer from d-c to a-c measurements. Extension of measurement ranges The resistance scale. The scale of direct voltage. The scale of direct current. The scale of alternating current. The scale of alternating voltage. Measurement of crest and surge voltage. Dissemination of units. International relations. Bibliography

Note. This circular gives an over-all picture of the sequence of measuring processes by which self-consistent system of electrical units is built up in the laboratories of the National Bureau of Standards. Starting with the ohm and the volt as maintained by groups of standard resistors and cells, the pamphlet describes the experimental processes by which the other electric and magnetic units, e.g., farad, henry ampere, watt, joule, gauss, and oersted, are derived. It also describes the series of steps by which the scales of measurement of resistance and voltage are derived experimentally Brief mention is made of the procedures for the dissemination of these standards of measurement throughout the world by the calibration of standard electrical measuring apparatus. An extensive bibliography lists papers describing the measurement procedures in greater detail and serves as a historical report of the work of the National Bureau of Standards in the field of electrical measurements during its first 50 years.

SMITH, ARTHUR WHITMORE

Electrical measurements in theory and application. Fourth edition New York Mc Graw Hill Book Company, Inc 1948 371 p illus. 23 cm. $6 00 988

Contents Introduction General principles. Ammeter and voltmeter methods. Ballistic-galvanometer and condenser methods. The current galvanometer The Wheatstone bridge. Potentiometer and standard-cell methods Measurement of current. Measurement of power. Electron tubes. The magnetic circuit. Measurement of magnetic flux and Mmf Magnetic tests of iron and steel. Alternating currents. Measurement of capacitance. Inductance. Measurement of inductance. Calibration of alternating-current instruments. Index

Note. A standard manual of fundamental methods and instruments. It is designed for use in connection with college courses, but the relatively full discussions of principles make it suitable for self-instruction and reference use also. The treatment assumes that readers will be familiar with elementary college physics and mathematics. In comparison to the third edition (1934) this edition exhibits many small changes, most of which expand or clarify the exposition. The type has been reset.

SMYTHE, WILLIAM RALPH

Static and dynamic electricity Second edition New York McGraw Hill Book Company, Inc., 1950 616 p illus 24 cm. (International series in pure and applied physics G P Harnwell, consulting editor) $10.00. 988A

Contents Basic ideas of electrostatics. Capacitors, dielectrics, systems of conductors. General theorems. Two-dimensional potential distributions. Three-dimensional potential distributions. Electric current. Magnetic interaction of currents. Electromagnetic induction. Transient phenomena in networks. Alternating currents. Eddy currents. Magnetism. Plane electromagnetic waves. Electromagnetic radiation. Wave guides and cavity resonators. Special relativity and the motion of charged particles. Appendix. Index.

Note An outstanding graduate-level text designed for students who are preparing for careers in research in physical and industrial laboratories. In it the basic laws of electrostatics, magnetostatics, and electromagnetic theory are formulated from the underlying *experimental facts*. Mathematical techniques for applying these basic laws to specific problems are emphasized. Much of the exposition is in the form of specific problems worked out in the text. Several hundred additional problems for the student to work are included. The first edition was published in 1939 This edition represents very extensive revision. Nomenclature has been revised and rationalized mks units have been adopted throughout. The treatment of electromagnetic waves has been expanded so as to reflect the increased interest in the microwave range. The chapter on wave guides and cavity resonators is new

STRATTON, JULIUS ADAMS

Electromagnetic theory New York Mc Graw Hill Book Company, Inc. 1941 615 p. illus. 23 cm. (International series in physics L. A. DuBridge, consulting editor) $10 00 989

Contents The field equations. Stress and energy The electrostatic field. The magnetostatic field. Plane waves in unbounded, isotropic media. Cylindrical waves. Spherical waves. Radiation. Boundary-value problems.

Note Postulating Maxwell's equations from the outset, the author of this advanced text and reference book emphasizes *dynamic* rather than static field theory A mathematical formulation is followed by comprehensive investigation of energy and stress relations. The properties of static fields are then discussed, and the *rest of the book is devoted to the propagation of plane, cylindrical,* and spherical waves, the theory of radiation and boundary-value problems.

SYMPOSIUM ON THE THEORY OF ELECTROMAGNETIC WAVES

The theory of electromagnetic waves A symposium held under the auspices of the Washington Square College of Arts and Science and the Institute for Mathematics and Mechanics of New York University and the Geophysical Research Directorate of the Air Force Cambridge Research Laboratories, June 6–8 1950 New York Interscience Publishers Inc. 1951 393 p 26 cm $7 50 990

Contents On the theory of electromagnetic wave diffraction by an aperture in an infinite plane conducting screen by H. Levine and J Schwinger On systems of linear equations in the theory of guided waves, by W Magnus and F Oberhettinger Wiener-Hopf techniques and mixed boundary value problems, by S. N Karp. Asymptotic solutions of differential equation in the theory of microwave propagation, by R. E. Langer Criteria for discrete spectra, by K. O. Friedrichs. Extension of Weyl's integral for harmonic spherical waves to arbitrary wave shapes, by H. Perlsky Kirchhoff's formula, its vector analogue, and other field equivalence theorems, by S. A. Schelkunoff. On the diffraction theory of Gaussian optics, by H. Bremmer Diffraction and reflection of pulses by wedges and corners, by J B Keller and A. Blank. Vector wave functions, by R. D Spence and C. P Wells. The W K.B. approximation as the first term of a geometric-optical series, by H. Bremmer Remarks concerning wave propagation in stratified media, by S. A. Schelkunoff The theory of magneto ionic triple splitting, by O E. H. Rydbeck. An asymptotic solution of Maxwell's equations, by M. Kline. Field representations in spherically stratified regions,

by [illegible]. Propagation in [illegible] atmosphere, by R. [illegible]. Reflection of electromagnetic waves from slightly rough surfaces, by S. O. Rice. The theory of scattering of radio waves in the troposphere and ionosphere (abstract), by H. G. Booker. Properties of guided waves (abstract) by R. R. [illegible]. Evaluation of integrals associated with wave motion in dispersive media and the formation of transients (abstract) by M. Carrier. Electromagnetic research in the U. S. Air Force Research Program, by N. C. Gerson.

Note: A collection of original papers which reflects the current mathematical approaches to theoretical problems in electromagnetic wave research. Although predominantly theoretical, many of the papers have clear applications in the design of radio antennas and other problems which require communications engineers.

WHITMER, ROBERT MOREHOUSE

Electromagnetics. New York Prentice-Hall, Inc., 1952 3?0 p. 22 cm. (Prentice-Hall physics series Donald H. Menzel, editor) $6.00. 990A

Contents: Charges, field, and potential. Reference among [illegible] equations. Capacitance. Dielectric materials. Electrostatic problems. Direct currents. Magnetic fields. Induced emf and inductance. Magnetic materials. Alternating currents. General field equations and the wave equation. Plane electromagnetic waves. Guided waves. The Hertzian vectors and circular waveguides. Appendix. References. Index.

Note: A textbook for upperclass college students [illegible] in either physics or electrical engineering. The author has assumed that the students will have had or be pursuing courses in general circuit theory and in vector analysis. The various topics treated in the chapter titles are treated usually from the field-theory point of view. Comparisons are drawn between electrostatic and magnetic concepts and equations, and the reader is introduced to the pertinent mathematics. Terms such as "conducting material" are defined more precisely than [illegible] customary in introductory courses.

WINCH, RALPH P

Electricity and magnetism. New York Prentice-Hall, Inc., 1955 ?55 p. illus. 23 cm. $8.00. 991

Contents: Electrical structure of matter. Introduction to the mks system of electrical units. Steady direct-current circuit problems. Introduction to magnetic flux and induced emf. Some of the properties of [illegible] capacitor in [illegible] circuit element. Some properties of an inductor in [illegible] circuit element. Vector method for solving ac circuit problems. Solution of sinusoidal ac circuit problems by the use of complex numbers. The electrostatic field. Electric potential. Properties of dielectrics. More about capacitance and capacitors. Magnetic force on moving charges. Magnetic fields in free space due to currents. More about induced emf's. Magnetic properties of materials. Ferromagnetic materials. The single-phase transformer. Oscillating circuits and Maxwell's theory. Appendices. Index.

Note: A textbook designed for use in intermediate undergraduate college courses offered to students who have completed courses in basic physics and elementary calculus. Mathematical expressions are freely used, but they are buttressed by [illegible] verbal text in which the explanation is chiefly in terms of physical concepts. Vector analysis [illegible] developed in the book, and some elementary vector methods are employed in computations. Rationalized mks units are used throughout the text. Conversion factors for converting into other systems are furnished in one of the appendices. The author [illegible] member of the faculty at Williams College.

ELECTRONICS

ADVANCES IN ELECTRONICS AND ELECTRON PHYSICS. Edited by L. Marton. Volume VII. New York Academic Press Inc., 1955 527 p. illus. 23 cm. $11.50. 992

Contents: The physics of semiconductor materials, by [illegible] and P. H. [illegible]. Theory of the electrical properties of germanium and silicon, by H. Brooks. Characteristic energy losses of electrons in solids, by L. Marton and others. Synchrotron by [illegible] [illegible], by G. K. Walters. Observational radio astronomy by J. P. Wild. Analog computers, by A. W. [illegible] and others. Electrical discharges in gases and modern electronics, by L. Goldstein. Author index. Subject index.

—— Volume VIII. New York Academic Press, Inc., 1956 562 p. illus. 23 cm. $13.00 993

Contents: Some new applications and techniques of molecular beams, by J. G. King and J. R. Zacharias. Field emission, by W. P. Dyke and W. W. Dolan. Mass spectroscopy by L. Kerwin. Amplitude and time measurement in nuclear physics, by C. [illegible]. Pulse amplitude analysis, by J. L. W. Churchill and [illegible] [illegible] [illegible]. Electron guns and focusing for high-density electron beams, by C. Susskind. On the electrical life of an oxide-cathode receiving tube by G. H. Metson. Traveling wave tubes, by M. Kuhn and [illegible]. Magnetron trends [illegible], by L. C. [illegible]. Author index. Subject index.

Note: Previously published volumes in this series appeared under the title Advances in electronics. The modified title indicates no change in editorial policy, but is an attempt to indicate that the series covers [illegible] the field than is designated by electronics [illegible] its connotation of applied science. Volumes VII and VIII continue the monographic reviews [illegible] some authors and titles are listed above. Each of the monographs is [illegible] critical survey of recent literature pertaining to its specific topic and contains an extensive list of [illegible] source articles. The series is addressed to graduate students and engineers who [illegible] to keep abreast of advances in theoretical and applied electronics in areas outside their immediate specialties. Earlier volumes in the series are still in print.

ALBERT ARTHUR LEMUEL

Electronics and electron devices. Third edition of *Fundamental electronics and vacuum tubes*. New York The Macmillan Company, 1956 587 p. illus 24 cm. $8.00 994

Contents: Basic electron theory. Emission of electrons. Two-electrode electron tubes. Three-electrode [illegible] electron tubes. [illegible] electrode electron tubes. Electron-tube rectifiers. Vacuum-tube amplifiers. Vacuum-tube power amplifiers. Vacuum-tube oscillators. Semiconductor devices. Transistor amplifiers and oscillators. Modulation. Demodulation. Wave-shaping and control circuits. Magnetic amplifiers. Photoelectric devices. Cathode-ray tubes. Index.

Note: An established college text now published under a different title from that used on the first edition, 1938, and the second edition, 1947. It is designed for use as [illegible] first book in electronics after the student has mastered the basic ideas of physics including electricity. Most of the explanation is in narrative form, and no very advanced mathematics is used. Also, most of the chapters contain good lists of references. In comparison to the second edition this third edition includes considerable new material. The transistor is an obvious addition. The chapter on magnetic amplifiers and the one on wave-shaping and control circuits are new, and important revisions have been made in other chapters. The author [illegible] Professor of Communication Engineering in Oregon State College.

BACHMAN CHARLES HERBERT

Techniques in experimental electronics. New York John Wiley & Sons, Inc., 1948 252 p. illus. 22 cm. $5.50. 995

Contents: Vacuum systems generalized. Pumps. Traps and baffles. Vacuum gauges. Valves and controlled leaks. Demountable joints. Controls and gadgets. Glass-blowing fundamentals. Vacuum system techniques. Leak detection. Metal versus glass vacuum systems. Sources of charged particles. Control of charged particles. The collection of charged particles. Assembly and processing of electronic devices. Miscellaneous hints and techniques. Index.

Note: A concise but very useful book for physicists, advanced students, and even amateurs [illegible] who are doing experimental work in electronics. Chiefly it is concerned [illegible] the construction of laboratory apparatus. Much expert "know-how" is included on such problems as degassing, glass-to-metal seals, etc. Lists of reference are appended to the chapters, and some suppliers of materials are mentioned as footnotes. The author was formerly on the staff of the General Electric Company and is now [illegible] member of the faculty of Syracuse University.

BLY MERWYN CLOXTON

A guide to cathode ray patterns. New York. John Wiley & Sons, Inc., 1943 39 p. illus. ?5 cm. $2.50. 996

SEARS, FRANCIS WESTON

Electricity and magnetism Reading, Mass. Addison Wesley Publishing Company, Inc, 1946 434, 14 p illus 23 cm. $8 50 986

Contents Coulomb's law The electric field. Potential. Current, resistance, resistivity D C. circuits. Chemical and thermal EMF's. Properties of dielectrics. *Capacitance and capacitors.* The magnetic field. Galvanometers, ammeters, and volt meters—the D C. motor Magnetic field of a current and of a moving charge. Induced electromotive force. Inductance. Magnetic properties of matter Ferromagnetism. Alternating currents. Electrical oscillations and electromagnetic waves. Electronics. Suggested books for collateral reading. Index.

Note Originally published as part of the author's three-volume *Principles of physics* this book provides more mature exposition of electricity and magnetism than is common in introductory college texts. The level of treatment assumes that the readers will have grasp of elementary calculus and will have acquired considerable familiarity with physical terminology Rationalized mks units are used. The relatively advanced level notwithstanding, the expository text is carefully written and most points are discussed fully There are more than 300 illustrations.

SILSBEE, FRANCIS B

Extension and dissemination of the electrical and magnetic units by the National Bureau of Standards Washington, D C Government Printing Office 1952 33 p illus 26 cm. (United States National Bureau of Standards Circular 531) $0 25 987

Contents Introduction. Fundamentals. Derivation of other units. Transfer from d-c to a-c measurements. Extension of measurement ranges. The resistance scale. The scale of direct voltage. The scale of direct current. Th scale of alternating current. The scale of alternating voltage. Measurement of crest and surge voltage. Dissemination f units. International relations. Bibliography

Note This circular gives an over-all picture of the sequence of measuring processes by which a self-consistent system of electrical units is built up in the laboratories of the National Bureau of Standards. Starting with the ohm and the volt as maintained by groups of standard resistors and cells, the pamphlet describes the experimental processes by which the other electric and magnetic units, e.g., farad, henry ampere, watt, joule, gauss, and oersted, are derived. It also describes the series of steps by which the scales of measurement of resistance and voltage are derived experimentally Brief mention is made of the procedures for the dissemination of these standards of measurement throughout the world by the calibration of standard electrical measuring apparatus. An extensive bibliography lists papers describing the measurement procedures in greater detail and serves as a historical report of the work of the National Bureau of Standards in the field of electrical measurements during its first 50 years.

SMITH, ARTHUR WHITMORE

Electrical measurements in theory and application Fourth edition. New York Mc Graw Hill Book Company, Inc., 1948 371 p illus. 23 cm. $6 00 988

Contents Introduction General principles. Ammeter and voltmeter methods. Ballistic-galvanometer and condenser methods. The current galvanometer The Wheatstone bridge. Potentiometer and standard-cell methods Measurement of current. Measurement of power Electron tubes. The magnetic circuit. Measurement of magnetic flux and Mmf Magnetic tests of iron and steel. SMYTHE, WILLIAM RALPH

Static and dynamic electricity Second edition. New York McGraw Hill Book Company, Inc., 1950 616 p illus. 24 cm. (International series in pure and applied physics G P Harnwell, consulting editor) $10.00 988A

Contents Basic ideas of electrostatics. Capacitors, dielectrics, systems of conductors. General theorems. Two-dimensional potential distributions. Three-dimensional potential distributions. Electric current. Magnetic interaction f currents. Electromagnetic induction. Transient phenomena in networks. Alternating currents. Eddy currents. Magnetism. Plane electromagnetic waves. Electromagnetic radiation. Wave guides and cavity resonators. Special relativity and the motion of charged particles. Appendix. Index.

Note An outstanding graduate-level text designed for students who are preparing for careers in research in physical and industrial laboratories. In it the basic laws of electrostatics, magnetostatics, and electromagnetic theory are formulated from the underlying experimental facts. Mathematical techniques for applying these basic laws to specific problems the emphasized. Much of the exposition is in the form of specific problems worked out in the text. Several hundred additional problems for the student to work are included. The first edition was published in 1939 This edition represents very extensive revision. Nomenclature has been revised and rationalized mks units have been adopted throughout. The treatment of electromagnetic waves has been expanded so as to reflect the increased interest in the microwave range. The chapter on wave guides and cavity resonators is new

STRATTON, JULIUS ADAMS

Electromagnetic theory New York Mc Graw Hill Book Company, Inc. 1941 615 p. illus 23 cm (International series in physics, L. A. DuBridge, consulting editor) $10 00. 989

Contents The field equations. Stress and energy The electrostatic field. The magnetostatic field. Plane waves in unbounded, isotropic media. Cylindrical waves. Spherical waves. Radiation. Boundary-value problems.

Note. Postulating Maxwell's equations from the outset, the author of this advanced text and reference book emphasizes dynamic rather than static field theory A mathematical formulation is followed by comprehensive investigation of energy and stress relations. The properties f static fields are then discussed, and the rest of the book is devoted to the propagation of plane, cylindrical, and spherical waves, the theory of radiation, and boundary-value problems.

SYMPOSIUM ON THE THEORY OF ELECTROMAGNETIC WAVES

The theory of electromagnetic waves. A symposium held under the auspices of the Washington Square College of Arts and Science and the Institute for Mathematics and Mechanics of New York University and the Geophysical Research Directorate of the Air Force Cambridge Research Laboratories, June 6–8, 1950 New York Interscience Publishers, Inc. 1951 393 p 26 cm $7 50. 990

Contents On the theory of electromagnetic wav diffraction by an aperture in an infinite plane conducting screen, by H. Levine and J Schwinger On systems of linear equations in the theory of guided waves, by W Magnus and F Oberhettinger Wiener Hopf techniques and mixed boundary value problems, by S. N Karp. Asymptotic solutions f differential equation in the theory of microwave propagation, by R. E. Langer Criteria for discrete spectra, by K. O. Friedrichs. Extension of Weyl's integral for harmonic spherical waves to arbitrary wav shapes, by H. Poritsky Kirchhoff's formula, its vector analogue, and other field equivalence theorems, by S. A Schelkunoff. On the diffraction theory of Gaussian optics, by H. Bremmer Diffraction and reflection f pulses by wedges and corners, by J B Keller and A. Blank. Vector wave functions, by R. D Spence and C. P W lls. The W.K.B. approximation as the first term of geometric-optical series, by H. Bremmer Remarks concerning wa e propagation in stratified media, by S. A. Schelkunoff. The theory of magneto ionic triple splitting, by O. E. H. Rydbeck. An asymptotic solution of Maxwell' equations, by M. Kline. Field representations in spherically stratified regions.

fice, 1954 416 p. illus. 24 cm. (United States. National Bureau of Standards. Circular 527) $2.75 1002

Contents: Introductory remarks, by L. Marton. Diffusion of electrons in infinite media, by C. H. Blanchard. Scattering of electrons by nuclei, by H. Feshbach. Low electron-energy losses in solids, by G. G. Engel. Summary calculations of multiple scattering, by W. T. Scott. On the general theory of multiple scattering, particularly of charged particles, by M. C. Wang and E. Guth. Multiple scattering of electrons and positrons in a gas, by G. Groetzinger. Scattering of electrons (experimental), by W. Bothe. Back-scattering of positrons and electrons, by H. H. Seliger. Range of electrons in the energy interval 0.1 to 1.1 Mev, by J. Fleeman. Measurements of electron scattering with the electron microscope, by C. E. Hall. Experimental study of limits imposed by plural scattering in electron-diffraction studies, by S. G. Ellis. Electron diffraction and average vibrational motion of gas molecules, by J. Karle. Fundamental problems of theoretical electron optics, by W. Glaser. Über den Bildentstehung im Elektronenmikroskop, von H. Boersch. On a phase-contrast theory of electron-optical image formation, by H. Bremmer. Theoretical study of quality of images, by A. Maréchal. Lentilles électroniques, par P. Grivet. A property of the paraxial ray equation and some consequences, by P. A. Clarke. Étude théorique de la lentille formée de trois cylindres coaxiaux de même diamètre à l'aide d'une représentation approchée du potentiel axial, par P. Grivet et M. Bernard. Étude théorique des lentilles à grille à l'aide d'une représentation approchée du potentiel, par M. Bernard. Note sur la théorie de la lentille électrostatique à électrode centrale elliptique, par E. Regenstreif. Note sur la théorie de la lentille électrostatique elliptique fonctionnant en régime transgaussien, par E. Regenstreif. Progress in microscopy by reconstructed wavefronts, by D. Gabor. Problems in the realization of diffraction microscopy with electrons, by M. E. Haine and T. Mulvey. On the theory of the magnetron, by L. Brillouin. On the theory of the magnetron, by D. Gabor and G. D. Sims. A point X-ray focus for shadow microscopy, by V. E. Cosslett and W. C. Nixon. X-ray shadow microscope, by L. Marton. Marton Schlieren method and weak lenses, by F. Bertein. Achievement of accuracy in electron-optical shadowgraphs of electromagnetic fields, by J. A. Simpson. Interpretation of electron-optical shadowgraphs, by R. H. Lauchenbruch. Characteristics of symmetrical magnetic electron lenses, by G. Liebmann. Present trends in electron microscopy, by V. E. Cosslett. Microanalysis by means of an electron-probe principle and corrections, by R. Castaing. Applications of the electron probe microanalyzer, by R. Castaing. Ions in cathode ray tubes, by C. H. Bachman. High-voltage electron guns, by M. E. Haine and P. A. Einstein. Electron-lens safety systems, by M. Knoll. Direct view storage tube, by M. Knoll and F. Rudnick. Point projection microscopes, by E. W. Müller. On the breakdown between metal electrodes in a dynamic vacuum, by F. Bertein and P. Grivet. Some studies of the contamination induced by electron bombardment in kinematic vacuum systems, by S. G. Ellis. Controlling of electron beam by means of a rotating electric field and its application, by K. Owaki. Experiments with adjustable magnetostatic electron lenses, by E. Ruska. Magnetic lenses of extremely short focal length (abstract), by J. B. LePoole and A. C. van Dorsten. Correction of field measurements in electron lenses, by A. Bruner. New interference phenomena in the electron microscopic images of plate-like crystals, by J. Hillier.

Note: This volume reproduces papers presented in 1951 at the Symposium on Electron Physics. Literature references are included in some of the papers, and pertinent discussion is printed as part of the proceedings. Electron physics for the purpose of the Symposium on Electron Physics was interpreted to mean the physics of the free electron, in distinction to physical electronics, which is a study of the bound electron. For many years work had been conducted at the National Bureau of Standards on the different phases of the physics of the free electron. The symposium was arranged around two topics in which Bureau activities had been carried out: namely, electron scattering and electron optics. A new trend in electron physics was indicated in the contributions in that a large percentage of the papers in electron optics were concerned with electron-wave optics.

Note A sketch-and-caption summary of cathode ray pattern types encountered in the usual course of laboratory and test bench work. The material is intended for use by radio and sound technicians and engineers. The book provides a quick and convenient guide containing over 100 charts of common occurrence with which the operator should be familiar The patterns produced for this book were developed with conventional amplifiers and oscillators and viewed on a small *oscilloscope*, using a standard circuit. A section on simple graphic analysis is included. Among the drawings are some of "perfect half-sine waves of various amplitudes for quick checking f wave shape purity Numerous circles with dotted axes are provided for the convenience of the technician who wishes to draw reference images from his own experience.

CORCORAN, GEORGE F, AND HENRY W PRICE

Electronics New York John Wiley and Sons, Inc., 1954 459 p illus 24 cm. $7 00 997

Contents Introduction. Mobile charges. The vacuum diode. Triodes and pentodes. Linear operation—class A. Non-linear operation—class A and class B Feedback circuits. Gas-filled tubes and associated circuits. Germanium diodes and transistors. Oscillators. Index.

Note A text developed in courses taught by the authors at the United States Naval Ordnance Laboratory and the University of Maryland. The style is compact, and the exposition is preponderantly mathematical. The basic physics of electron tube and transistors are covered, along with the features and characteristics of typical circuits in which tubes or transistors are essential elements. More space has been given to the transistor than is usual in general introductory texts. The transistor sections especially have potential value for engineers who were graduated before the transistor assumed its present importance and who now find themselves in need of an engineer's introduction to this new development.

HARMAN, WILLIS W

Fundamentals of electronic motion. New York McGraw Hill Book Company, Inc., 1953 319 p illus 23 cm (McGraw Hill electrical and electronic engineering series, Frederick Emmons Terman, consulting editor) $8 00 998

Contents Fields and electrons. Motion in a static electric field. Electron properties and sources. Motion in a magnetic field. Negative and positive space charge. Motion in time-varying fields. Space-charge waves and velocity modulation. Traveling-wave amplification Traveling-wave magnetron amplifiers and oscillators. Relativistic electrodynamics. Appendixes. Index.

Note In this work, electron tube phenomena, or the motions of free electrons individually and collectively in electronic devices, are used as the framework for presenting the philosophy and some f the more important techniques of solving engineering problems by mathematical analysis. In fact, the book can be viewed as an introduction to applied mathematical analysis. However the framework and the envelope at so thoroughly interwoven that it is of interest chiefly to readers whose education or experience lies in electronics. The treatment is on first year graduate level. The uthor is Associate Professor of Electrical Engineering in Stanford University

LOEB, LEONARD [illegible]

Basic processes of gaseous electronics Berkeley University of California Press, 1955 1 012 p illus 24 cm $13 50 999

Contents. Ionic mobilities. The diffusion of carriers in gases. The velocities of electrons in gases. The distribution of energy of electrons in field in gas. The formation of negative ions. The recombination of ions. Electrical conduction in gases below ionization by collision. Ionization by collision of electrons [illegible] gas—Townsend's first coefficient. The second Townsend coefficient. Appendixes Notes covering recent advances. Standard reference data. Index to authors. Index to subjects.

Note Essentially a reference book characterized by broad scope and wealth of detail. It integrates and interprets the results reported in hundreds of publications. The source articles are cited, and the names of the authors are brought together in a nine-page index to authors, thus making the book useful as a guide to the literature. Many data of reference value are presented in the form of graphs and tables. Some of the author's interpretations of research results are controversial, a fact that he himself acknowledges in such passages as the following: In the preceding paragraphs, certain positive and dogmatic statements have been made. This applies especially to the eradication of ionization by positive ions in a gas as an active mechanism in common discharges. It is doubtful if all discharge physicists will accept these statements. The book is a successor to the author's *Fundamental processes of electrical discharge in gases* 1939 rather than a revised edition of it.

MARTON, L , AND OTHERS

Electron physics tables By L. Marton, C. Marton, and W G Hall Washington, D C. Government Printing Office, 1956 83 p 26 cm. (United States. National Bureau of Standards Circular 571) $0 50 1000

Contents. Introduction. Electron physics tables.

Note. These tables were prepared to replace *Miscellaneous physical tables*, part II, *Electronic functions*. (Mathematical Tables 17) issued by the National Bureau of Standards in 1941 In preparing the new tables, the compilers adopted such quantities for tabulation as were suited to changed requirements in physics and in engineering. Eight parameters were calculated on the Standards Electronic Automatic Computer (SEAC) and tabulated with an eight-digit accuracy In order to facilitate interpolation each of the quantities was treated as an independent variable at selected intervals, and the values of the other quantities were determined from it.

NOTTINGHAM, WAYNE B

Bibliography on physical electronics. Prepared by Wayne B Nottingham and staff Cambridge, Mass. Research Laboratory of Electronics, Massachusetts Institute of Technology, 1954 428 p 24 cm

Available from Addison Wesley Publishing Company Reading, Mass , $10 00 1001

Contents (abridged) General electronics Theory Fundamental components and phenomena. Gas discharges. Electron emission and surface phenomena. Contact potential. Field emission. Photoelectric emission. Secondary emission. Space charge and electron flow Surface adsorption. Thermionic emission. Thermally produced positive ions. Work-function Solid state and conduction Conductors. Hall effect. Insulators. Rectifiers. Semiconductors. Phosphors and luminescence Theory Fatigue quenching, decay Infrared sensitive phosphors. Some salts, oxides and minerals. Sulfides and halides. Photocells, photovoltaic effect, and photoconductivity Theory Metallic salts. Metals. Oxides and barrier layers. Techniques Amplifiers, power supplies, current measurement, etc. Electron diffraction and scattering. High vacuum. Miscellaneous.

Note. A classified bibliography of books and articles on electron physics or to use the compiler's own term, "physical electronics, which he defines as "that subject dealing principally with physical phenomena related closely to the free electron. Such areas of electronics as atomic and molecular spectroscopy are not included. Applications are covered only in the section on techniques and, in turn, this section is devoted almost entirely to applications which are of value in laboratory research. The original intent was to cover comprehensively the literature published 1930–1950, with the inclusion of selected basic articles published 1900–1929 However there are numerous citations of articles published after 1950 and some references to 1954 publications. Titles as well as authors' names are given, and titles in foreign languages have been translated into English. The reference value of the book is reduced considerably by the lack of uthor and subject indexes.

UNITED STATES NATIONAL BUREAU OF STANDARDS ELECTRON PHYSICS SECTION

BLAIR, THOMAS ARTHUR

Climatology general and regional. New York Prentice-Hall, Inc., 1942 484 p. illus. 23 cm. (Prentice-Hall geography series consulting editor N. A. Bengtson) $6.95 1005

Contents: Part I. General climatology: Weather and climate. Temperature as a climatic element. Pressure, wind, and moisture as climatic elements. Climatic controls. Climatic variability. Climatic influences. The classification of climates. Part II. The climates of the world: General climatic features of North and Central America. The humid climates of Central America, southern Mexico, West Indies, southern Florida, and Hawaii. The dry climates of North America. Subtropical climates of the United States. Humid intermediate climates of North America. Polar and subpolar climates of North America. Climates of South America. Humid tropical and subtropical climates of the East Indies, the Philippines, and southern Asia. Dry climates of Eurasia. Humid climates of China, Japan, and Manchuria. Climate of the Mediterranean region. Humid intermediate, subpolar, and polar climates of Europe and Siberia. Tropical climates of Africa. Subtropical climates of Africa. Climates of Australia and New Zealand. Appendices: Bibliography temperature and rainfall tables. Index.

Note: This work covers the entire subject of climates, the agents which comprise them, the factors which influence them, and climatic effects and phenomena. Particular attention is given to the significance of plants as indicators of climatic types. Conditions of life and agricultural pursuits are emphasized.

BLAIR, THOMAS ARTHUR

Weather elements a text in elementary meteorology Third edition. New York Prentice-Hall, Inc., 1948. 373 p. illus. 23 cm. 1006

Contents: The atmosphere. Observing temperature, pressure, and wind. Observing moisture, evaporation, visibility and upper air conditions. Solar radiation and its effects. Condensation of water in the atmosphere. Interrelations of temperature, pressure, and wind. The general circulation. The secondary circulation. Air masses and fronts. Lesser disturbances. Weather analysis and forecasting. Aviation and the weather. Climate. World weather relations and climatic influences. Electrical and optical phenomena. The United States Weather Bureau. *Appendices:* Bibliography. Conversion factors and tables. Mean monthly and annual temperatures and precipitation (tables). Index.

Note: A clearly written introduction that is used both as textbook in college courses and as a self-instruction book. Although the exposition avoids the use of advanced physical and mathematical concepts, the reader is given a rather comprehensive and scientifically accurate view of meteorological phenomena. A fourth edition, revised, was published in 1957 [illegible] p., $6.75.

BYERS, HORACE R., editor

Thunderstorm electricity The research reported in this document has been made possible through support and sponsorship extended by the Geophysics Research Directorate of the Air Force Cambridge Research Center under Contract No. AF 19(122)–194 It is published for technical information only and does not necessarily represent recommendations or conclusions of the sponsoring agency Chicago The University of Chicago Press, 1953 344 p. illus. 25 cm. (The University of Chicago Committee on Publications in the Physical Sciences Walter Bartky and others) $7.00 1007

Contents: Introduction, by H. R. Byers. The atmospheric electric field and its meteorological causes, by H. Israël. Investigations of the potential gradient at the earth's ground surface and within the low atmosphere, by L. Koenigsfeld. Thunderstorm structure and dynamics, by H. R. Byers and R. R. Braham, Jr. Observational data on the formation of precipitation in cumulonimbus clouds, by H. Weickmann. Structure and electrification, by E. J. Workman and S. E. Reynolds. Experimental contributions to the knowledge of charge generation, by L. B. Loeb. Measurements of the electricity carried by precipitation particles, by R. Gunn. Thundercloud electrification in relation to rain and snow particles, by S. Chapman. Aircraft measurements of electric charge carried to ground through thunderstorms, by O. H. Gish. Charge distribution and electrical processes deduced from lightning measurements, by D. J. Malan and B. F. J. Schonland. Field changes due to lightning discharges, by E. T. Pierce and T. W. Wormell. Simultaneous measurements of sferics signals and thunderstorm activity by R. E. Bauer. Long-distance location of thunderstorms, by H. Norinder. Aircraft and lightning, by M. M. Newman. Power line protection, by E. L. Harder and J. M. Clayton.

Note: This book had its origin in research and a conference sponsored as noted in the subtitle. It contains the papers presented at the conference and several additional ones. Specialists in meteorology and related fields working in the United States of America and other countries authored the papers, and they addressed themselves to an audience possessing similar interests and backgrounds. In many of the papers recent experimental advances are described. Literature references are given for all. As the titles of the papers indicate, some of them deal with practical applications. The book is of interest to geophysicists, physicists, meteorologists, and to a lesser extent to engineers who are concerned with atmospheric lightning if only from the viewpoint of protecting power systems and structures against it. The volume lacks an index.

CARTER J H AND OTHERS

On atmospheric pollution a group of contributions. Boston The American Meteorological Society 1951 55 p. illus. 28 cm. American Meteorological Society Meteorological monographs Vol. 1 no. 4) $4.50 1008

Contents: Some aspects of the air pollution problem a panel discussion. Enforcement principles and standards, by J. H. Carter. Meteorology applied to air pollution abatement, by C. A. Gosline. Meteorological influences and their application to control of the source, by E. W. Hewson. Climatology and its part in pollution, by H. Landsberg. Diffusion of stack gases in very stable atmospheres, by M. L. Barad. The statistical theory of diffusion by turbulent eddies, by O. W. Beier. Instruments for air pollution measurement, by W. L. C. Hemeon. Meteorological factors in stack pollution from tall stacks, by F. H. Lowry. Ground-level measurements of oil-fog emitted from a hundred-meter chimney, by P. H. Lowry and others. Continuous profiles in the lower layers of the atmosphere, by H. F. Poppendiek. Air-trained studies of diffusion in urban areas, by H. Rouse. Analyzing winds for frequency and duration, by R. H. Sherlock. The forecasting of micrometeorological variables, by M. E. Smith.

Note: In this booklet various aspects of the problems of atmospheric pollution are discussed by meteorologists. Most of the papers describe the results of recent, original investigations. All but one of the papers were presented at a symposium on atmospheric pollution held during the 50th meeting of the American Meteorological Society at St. Louis in January 1950.

Booker Sferics, by R. C. Waats. Microseisms Observations and theory f microseisms, by B Gutenberg. Practical application of microseisms to forecasting, by J B Macelwane. Index.

Note A comprehensive statement and survey of meteorological knowledge. The papers were written *especially* for it, and the authors, who are recognized specialists, were drawn from several nations including the U S. A. A typical paper contains about 16,000 words and is supplemented by long bibliography of the pertinent literature. The work is of interest to meteorologists and to physicists interested in such branches of meteorology as atmospheric electricity and the properties of the upper atmosphere.

BERRY, FREDERIC AROYCE, AND OTHERS, editors

Handbook of meteorology edited by F A Berry, Jr , E Bollay and Norman R. Beers. New York McGraw Hill Book Company, Inc., 1945 1 068 p. illus. 23 cm $13.50 1004

Contents Numerical and graphical data. *Meteorological* mathematics and calculations. Physics of atmospheric phenomena. Radiation. Meteorological thermodynamics and atmospheric statics. *Kinematics* and dynamics f fluid flow The scientific basis f modern meteorology Meteorological instruments. Transmission and plotting of meteorological data. *Synoptic meteorology and weather forecast*ing. Clouds and states f the sky *Climatology Hydrometeorology* Oceanography Index.

Note A reference book of fundamental theory and practical data, useful to students of meteorology and to professional meteorologists and weather forecasters. Meteorology is viewed as an applied science as well as branch of physics, and the kinds of material included are similar to the kinds included *in the standard handbooks of other* branches f engineering. Each section is the work of one or more experts, and adequate, w ll-selected bibliographies accompany most f the sections.

ment of isothermal emissivities. Nocturnal radiation measurements. Notes on radiative cooling of the free atmosphere. Appendix: A mechanical integrating device. Bibliography. Atmospheric radiation chart, second edition.

Note: This monograph is divided into three parts, the first dealing with the general theory of radiative heat transfer in the atmosphere without regard to the particular structure of the infrared spectrum. The second part analyzes this spectrum and shows the connection between its structural elements and the integral effects observed as radiative flow of heat. The last part deals with the direct measurement of radiative heat flow and the empirical relationships derived from such measurements. The bibliography contains 123 references to the world literature.

FLORA, SNOWDEN D

Tornadoes of the United States. Second edition. Norman University of Oklahoma Press, 1954 221 p illus 22 cm. $3.50 1017

Contents: When the tornado strikes. Causes and structure of tornadoes. The destructive force. Forecasts and warnings. When to expect tornadoes. How to escape death and protect property. Freaks of the storm. Some outstanding disasters. The tornado hazard by states. Other whirling storms. Tornadoes in other parts of the world. *Appendices:* Noteworthy tornadoes of the United States. Tornadoes that occurred in groups or series. Index.

Note: Written primarily for nonspecialists, this book describes the causes and nature of tornadoes, cites examples of their destructive force, describes some of the violent ones that have occurred in the United States of America and in other countries, and provides ... ... of tabulated data. Some remarkable pictures of storms and of their damage are included. The book ... primary purpose is to provide information on tornadoes to persons living in regions where these destructive storms occur with some frequency. Because of the wide range of information presented, especially on individual tornadoes, the book is useful also to professional meteorologists.

FUJITA, TETSUYA, AND OTHERS

Mesoanalysis an important scale in the analysis of weather data by Tetsuya Fujita, Herman Newstein, and Morris Tepper presented at the 136th National Meeting of the American Meteorological Society May 1955, at Washington, D. C. (The research reported on in this paper has been conducted jointly by the University of Chicago and the U S. Weather Bureau.) Washington, D C. Government Printing Office 1956 83 p. illus. (part col d) 26 cm. (United States. Weather Bureau. Research paper no 39) $0.50. 1018

Contents: Introduction. The severe local storms research unit network. Reduction of data and reduction to ... suitable datum. Pattern time sections. Construction of the mesomaps. The case of June 24–25, 1953. Additional mesomaps. Upper-air field. Significant findings. Appendix: Pattern time sections.

Note: This publication, like others in the same series, is intended for professional meteorologists. It presents the concepts of ... significant advance in local weather analysis and forecast, and is published as ... preliminary manual for mesoanalysis. The data used in the example analyses are reproduced in the form of station time sections, four to ... page, on the last 43 pages of the paper. The mesomaps, of which there are ten in color, show local weather conditions for the period June 4–25, 1953, in Kansas and also surrounding states. Observations from ... total of 193 stations were involved.

GARBELL, MAURICE ADOLPH

Tropical and equatorial meteorology New York Pitman Publishing Corporation, 1947 237 p. illus. 28 cm. $12.00. 1019

Contents: General circulation. Air masses in the tropics. The tropical sky. Subtropical anticyclonic cells. Temperate fronts. Polar outbreaks in the tropics. Tropical and intertropical fronts. Tropical cyclones. Violent tropical weather phenomena. Regional tropical weather: The American space. The Pacific space. The Asiatic and Indian Ocean space. The Eurafrican space. The Atlantic space. References and bibliography. Index.

Note: This work explains the causes that underlie tropical weather phenomena and shows how the customary meteorological concepts must be adapted when applied to them. The idea for the polar front, for example, is shown as inadequate when used indiscriminately to analyze equatorial weather because air masses in low latitudes do not have the sharp temperature differences typical of air masses in high latitudes. The second part analyzes the weather in the five principal land and sea areas lying within 30° north and south of the equator. The treatment is dynamic and synoptic rather than ... Numerous graphs, maps, and cloud photographs are used to supplement the text. The work is designed for use in advanced courses and also as ... self-instruction text for airline pilots, ship navigators, and other persons interested in the weather of the tropics.

HALPINE CHARLES GREHAM, AND HALTON HAGEN TAYLOR

A mariner's meteorology Princeton D Van Nostrand Company Inc. 1956 371 p. illus. 24 cm. $8.00 1020

Contents: Introduction. The atmosphere, its characteristics, composition, and structure. The elements of meteorology and their measurement. Cloud types and obstructions to vision. Variations of temperature and their effects. Circulation of air. Currents and winds. Air masses, fronts, and disturbances—their development and effects. Weather reports. Weather maps. Weather forecasts. Climatology. Oceanography. Weather at war. Glossary. Appendixes. Index.

Note: A step-by-step presentation of meteorological knowledge. As the title indicates, it is addressed primarily to mariners. It is not, however, restricted to persons whose vocations take them to sea but is addressed also to amateur sailors and yachtsmen. It describes weather phenomena as observed from the sea and adjacent coastlines, including, of course, many observations that can be made as well on land. Cloud types, weather maps and reports, and elementary meteorological instruments are described and pictured. The technical terminology of meteorology is freely used, but terms are carefully defined when first introduced. A series of weather maps is reproduced and discussed. The book is ... companion to the ... "... ... meteorology" described elsewhere in this volume.

HAURWITZ BERNHARD AND JAMES M AUSTIN

Climatology New York McGraw Hill Book Company Inc., 1944 410 p illus. 23 cm $5.00 1021

Contents: Preface. Introduction. Part A. General climatology: Solar radiation and terrestrial heat balance. Temperature. Wind and pressure. Hydrometeors. Air masses, fronts, cyclones, and anticyclones. Climatic zones and types. Description of climatic types. Microclimatology. Part B. Regional climatology: North and Central America. South America. Europe. Asia. Africa. Australia and New Zealand. Arctic and Antarctic. Oceanic regions. Index.

Note: This introductory text for students of meteorology is concerned with ... description of climates in all parts of the world, as produced by the combined action of such variables as temperature, pressure, wind, humidity and precipitation. Part A presents ... survey of each of these elements, their distribution over the globe, and the manner in which they affect climate. Part B gives ... detailed description of the climatic features of each continent and of the oceans. Seventeen maps of the world showing mean annual temperature range, mean sea level pressure, ocean currents, surface temperatures, precipitation, cloudiness, etc., are contained in a pocket at the end of the volume.

HAURWITZ, BERNHARD

Dynamic meteorology New York Mc Graw Hill Book Company Inc., 1941 365 p. illus. 23 cm. $7.50. 1022

Contents: The earth. The equation of state for dry and moist air. Atmospheric statics. Adiabatic changes of dry air. Condensation. Adiabatic changes of moist air. Further applications of thermodynamics to the atmosphere. Radiation. The equations of motion of the atmosphere. Simple atmospheric motions. Surfaces of discontinuity. Kinematical analysis of the pressure field. Atmospheric turbulence. Turbulent mass exchange. The energy of atmospheric motions. The general circulation of the atmosphere. The perturbation theory of atmospheric motions. Air masses, fronts, cyclones, and anticyclones. Appendix. Indexes.

Institution, 1944 616 p 23 cm. (Smithsonian miscellaneous collections Vol 90, whole volume) $1 50 1010

Contents. Contractions and symbols. Part I Pressure, temperature, and precipitation at selected stations, 1921 1930. Part II, Ocean and sea-level pressures Atmospheric pressures over the northern oceans and sea-level pressures at selected land stations, 1921–1930. Part III, Late reports and additional data not published in Volume 79 Part IV Errata in Volume 79 Appendix Sun spots and solar radiation, 1921 1930 Alphabetical index of stations and countries. Geographical index by zones of latitude.

—— World weather records 1931–1940 (continued from Volumes 79 and 90) Prepared in cooperation with the various official weather services and observations of the world Assembled and arranged for publication by H. Helm Clayton and Frances L Clayton Published under grant from John A Roebling (Publication 3803) Washington, D C Smithsonian Institution, 1947 646 p 23 cm (Smithsonian miscellaneous collections Vol 105, whole volume)$3 50 1011

Contents Editorial note. Abbreviations and symbols. Part I, Pressure, temperature, and precipitation at selected stations, 1931–1940 Notes. Data. Part II, Sea-level pressure at 10° intersections over Northern Hemisphere. Part III, Additional data. Appendixes Lake and river levels. Sunspot numbers. Alphabetical index of stations and countries. Geographical index by 10° zones of latitude.

Note These volumes provide a comprehensive and valuable record of fundamental weather data on a world-wide scale, for the period 1895–1910. Each volume tabulates the monthly means of pressure, temperature, and rainfall as recorded in all parts of the world for the years indicated. The data are arranged under the grand divisions of the earth, Africa, Asia, Australia, Europe, Indian Ocean, North America, North Atlantic, and South Pacific. Within each division the breakdown is by country and finally by station. The units of measurement used are those of the countries in which the observations were made.

CONRAD, VICTOR, AND L W POLLAK

Methods in climatology Second edition, revised and enlarged, including some methods in general geophysics. Cambridge, Mass. Harvard University Press, 1950 459 p illus 24 cm $7 50 1012

Contents (abridged) Part I, Methods in climatology: General remarks. Statistical analysis of climatic elements. Aids to computation. Some problems of curve fitting, and smoothing of numerical series. Harmonic analysis. Characteristics of some selected climatic elements. Spatial comparison of climatic elements. Essential elements of the climatography Part II, Computing devices; periodography· Computation with mechanical and electrical devices. Periodography· hidden periodicities. Test of significance. Determination of periods with the aid of autocorrelation. Appendixes. Index.

Note A valuable presentation in which are described climatological rather than geographical methods of examining observational data and constructing therefrom quantitative description of climate. It is designed to facilitate the step from qualitative to quantitative methods for college students of climatology and of related fields such as geography and agriculture. The methods described are based on mathematical and statistical analysis hence the readers need working knowledge of these disciplines. Part I was added in this edition, and there are other important revisions and augmentations.

CRAIG, RICHARD A

The observations and photochemistry of atmospheric ozone and their meteorological significance Boston The American Meteorological Society 1950 50 p illus 28 cm (American Meteorological Society Meteorological monographs. Vol I, no 2) $2 50 1013

Contents Introduction. Ozone observations. The photochemistry of atmospheric ozone. A discussion of the observed characteristics of atmospheric ozone. Summary and conclusions. References. Appendixes Observed total amounts and vertical distributions of ozone. Details of photochemical calculations.

Note A survey of the present state of knowledge of atmospheric ozone. The historical development of this knowledge and the reported results and observations are presented in a readable, well-organized form. The bibliography although not comprehensive is substantial.

DONN, WILLIAM L

Meteorology with marine applications. Second edition New York McGraw Hill Book Company, Inc, 1951 465 p illus 24 cm. $6 25 1014

Content (abridged) Heat and temperature of the air Humidity Atmospheric equilibrium. Condensation and precipitation. Clouds and thunderstorms. Atmospheric pressure. Winds—observation and theory Primary or terrestrial wind circulation. Weather analysis and interpretation. Optical features of the atmosphere. The oceans. Bibliography Appendixes Teletype sequence code. Tables of average weather summaries for principal ports and islands. Index.

Note A general introduction to meteorology and aimed specifically at mariners and others with practical interest in the weather at sea. It is well written and illustrated and, though semi-technical in style, it is not difficult to read. The most obvious change in the present edition is a complete revision of the chapter on weather coding and notation, to make it conform to the International Weather Code, which went into effect on January 1 1949

DOUGLASS, ANDREW ELLICOTT

Climatic cycles and tree growth. Volume III A study of cycles Washington, D C. The Carnegie Institution of Washington, 1936 171 p illus 25 cm. (Carnegie Institution of Washington. Publication no 289) $3 00 1015

Contents Introduction. Cyclogram analysis. The discontinuous period in cyclogram analysis. Analysis of solar records. Analysis of terrestrial records. Relation between terrestrial and solar records. The cycle problem and long-range forecasting. Appendix Studies f the cyclograph, by E. Schulman. Cycle summation curves. An automatic optical periodograph, by A. E. Douglass. Bibliography

Note. Although part of a three-volume publication on climatic cycles and tree growth, Volume III may be used independently of the first two, which are out of print. The present work is based on an analytical method developed by the author which involves the use of a new type of optical instrument known as the cyclograph. This instrument produces photographically a rectangular chart of sunspots or tree ring records with a general time scale placed horizontally progressing from left to right, and differential time scale in the vertical. From the viewpoint of climatology the investigation is a study of the geographical extension of certain climatic similarities, since by means of the cyclograph similarities not hitherto observed can be recognized. One hundred ninety-seven articles and monographs are listed in the bibliography

ELSASSER WALTER M

Heat transfer by infrared radiation in the atmosphere. With a copy of the atmospheric radiation chart, second edition Cambridge Mass Harvard University Press 1942 108 p. illus 25 cm (Harvard meteorological studies. No 6) $1 25 1016

Contents Principles of radiative transfer· Kirchhoff's law the equation f transfer Planck's law Transfer of monochromatic radiation. Transfer f non-monochromatic radiation. The general transfer problem. Atmospheric radiation chart. Structure and absorption of infrared bands Absorption of spectral lines. Absorption of band spectrum Pressure and temperature corrections. The water-vapor spectrum. Spectra f other atmospheric gases. Absorption of sunlight. The measurement of atmospheric radiation Instruments for atmospheric radiation measurements. Measure-

Note: "Continuing evaporation studies conducted by the Weather Bureau have been aimed primarily towards the development of improved methods for estimating annual lake evaporation from pan observations and related meteorological data normally collected in the established observational programs. Since the network of pan stations is quite sparse and the records are notably incomplete—usually seasonal in nature—the development of [illegible] universally applicable procedures for extrapolating and interpolating pan evaporation has also been [illegible] major objective. This paper presents the results of these studies, including examples of suggested methods of computing reservoir evaporation, given selected combinations of basic data. Much of the material presented can be considered as only preliminary—the basic approach to the subject is believed sound, but some of the empirical aspects are based on rather meager data.

KRICK, IRVING P., AND ROSCOE FLEMING

Sun, sea and sky weather in our world and in our lives. Philadelphia J B Lippincott Company 1954 248 p. illus. 22 cm. $3 95 1030

Contents: Rivers in the sky. Clouds ever changing. Forecast for yesterday today and tomorrow. Tools of the weatherman's trade. When the wind blows. The paradoxes of climate. Predictions public and private. Weather and war. Increasing the take. Fruits of cloud-making. In partnership with nature. Index.

Note: Discussion of comparatively recent developments in meteorology in general, and weather forecasting in particular, form the central core of this popularly written book, though it is essentially [illegible] of information. It touches upon such diverse topics for instance as the complexity of predicting the trajectory of long-distance missiles, [illegible] about the weather part in the defeat of Napoleon at Waterloo, the causes of London fogs, and the present scope of industrial meteorology. The book is competently written and easy to read.

LAIRD CHARLES AND RUTH LAIRD

Weathercasting. Englewood Cliffs, N J Prentice-Hall, Inc., 1955 163 p. illus. 24 cm. $3 95 1031

Contents: Introduction. Observing. Forecasting. Instruments. Index.

Note: An elementary book about the principles and techniques of weather forecasting. It is addressed to amateurs who make weather observations and attempt weather forecasts as a hobby. In supplying information that will aid the amateur in constructing instruments, taking observations, and making forecasts, the authors also convey much information about the interpretation of official weather maps and forecasts.

LEOPOLD L. B., AND OTHERS

On the rainfall of Hawaii a group of contributions. Boston The American Meteorological Society 1951 55 p illus. 28 cm. (American Meteorological Society Meteorological monographs. Volume 1, no 3) $2.50 1032

Contents: Foreword, by E. C. Auchter. Introduction. Hawaiian climate, its relation to human and plant geography, by L. B. Leopold. Statistical investigations into the climatology of rainfall on Oahu (T.H.) by H Landsberg. The geographic distribution of average monthly rainfall, Hawaii, by C. K. Stidd and L. B. Leopold. A study of rainfall over Oahu, by T. C. Yeh and others. On the relation between the circumpolar westerly current and rainfall over the Hawaiian Islands, by T. C. Yeh and others.

Note: Original papers written as part of [illegible] meteorology research program intended to explore "the feasibility of obtaining useful practical weather forecasts for Hawaii, particularly long-range forecasts," are printed in this booklet. The research program, sponsored by The Pineapple Research Institute of Hawaii and set up under the guidance of C. G. Rossby is an illustration of meteorological research applied to [illegible] particular region and designed to delineate the factors which are important in long-range weather forecasting for the region.

LONGSTRETH T MORRIS

Understanding the weather A revision of *Knowing the weather* New York The Macmillan Company 1953 118 p. illus. 21 cm. $2.50. 1033

Contents: Our layered atmosphere. The large-scale circulation. Close-up of an air parcel. Air mass, the weather cradle. Fronts. Cyclones and finally Anticyclone fair-weather friend. Wind. Temperature. Clouds, weather announcers. Fog. Rain (old style—(man-induced)) Snow. Thunderstorms. Hurricanes. Tornadoes. The weather map. Forecasting. Climate. The amateur and his tools. Bibliography. Technical terms used in this book. Some useful equivalents. What the weather can do. Index.

Note: Published originally in 1943 under the title *Knowing the weather* this book for amateur weathermen and general readers has been thoroughly rewritten. The style has been improved, and considerable material based on meteorological research during and subsequent to World War II has been included.

NAMIAS JEROME

Subsidence within the atmosphere. Cambridge Mass. Harvard University Press, 1934 61 p. illus. 24 cm. (Harvard meteorological studies. No 2) $0.85 1034

Contents: Introduction. General discussion of subsidence within the atmosphere. The effect of subsidence acting on the lapse rate. Factors in the development of subsidence inversions. Divergence and the subsidence dome. The conservation of potential temperature along the surface of subsidence. Observed variations in the specific humidity along the surface of subsidence. Illustrative synoptic material. Summary. References.

Note: A technical discussion of subsidence or sinking of layers of air in the atmosphere. The paper is divided into two major portions, the first of these being [illegible] discussion from the general standpoint in which diagrams are presented based on the aerological material which is covered synoptically in the second section of the report. The second section gives the salient features in connection with three situations, practically [illegible] the space being taken up [illegible] detailed analysis of the aerological material for these periods, with special emphasis upon the subsidence inversions which are observed. There are 13 references listed.

NAMIAS JEROME

Thirty-day forecasting a review of a ten-year experiment. With a foreword by Hurd C. Willett Boston The American Meteorological Society 1953 83 p. illus. 28 cm. (Meteorological monographs editor E. Wendell Hewson. Vol. 2 no. 6 July, 1953) $3.50. 1035

Contents: Introduction. Background for 30-day forecasts. The relationship of mean circulation patterns to weather and storm tracks. The nature of 30-day mean circulations. Evolution of 30-day mean circulations. Methods of forecasting the motion and development of planetary waves. Statistical auxiliaries. Verification of forecasts. References. Appendix: Mechanics and organization of the forecast routine.

Note: "This monograph is [illegible] summary of the results of research and operations in connection with [illegible] program designed to extend the time range of weather forecasts, beginning with [illegible] history of the project and [illegible] classification of circulations according to periods of evolution. After treating the background against which 30-day forecasts are produced—the normal atmospheric circulation and circulation frequency distributions—it is demonstrated that the 30-day mean circulations are closely related to the average weather characteristics of the month. Qualitative and objective methods of translating mean circulation patterns into temperature and precipitation are described. The research was carried out as [illegible] joint undertaking of the United States Weather Bureau, the U. S. Bureau of Agricultural Economics, and the Department of Meteorology of the Massachusetts Institute of Technology. This monograph is related to the author's *Methods of extended forecasting*, Washington, D. C., 1943, and *Extended forecasting by mean circulation methods*, Washington, D. C., 1947. It is addressed to professional meteorologists. A bibliography of 93 literature references is included.

Note The author presents concise treatment of the laws of thermodynamics and dynamics that operate in the atmosphere. He stresses those results of dynamic meteorology which are of importance to the practical forecaster A large number of bibliographic references are given in the text.

HAYNES, BENARTHUR CASTLE

Techniques of observing the weather New York John Wiley & Sons, Inc., 1947 272 p illus 21 cm $4 90 1023

Contents The atmosphere. The weather observatory Clouds. Visibility Hydrometeors. Temperature Humidity Wind. Pressure. Precipitation. Winds-aloft observations. Electronic meteorological observations. An *improvised weather station.* References. Bibliography Appendix. Index.

Note. There are few digressions into general meteorology in this practical book for the amateur weather observer The text is confined largely to explanations of established techniques of making observations and recording weather data. The observer is taught how to apply scientific method to a subjective activity which could easily invite ambiguity The information on instruments is rather general but adequate for most beginners. Some of the suggestions for improvisation of instruments are ingenious. There is an extensive bibliography and the illustrations are excellent.

HOLMBOE, JORGEN, AND OTHERS

Dynamic meteorology, by Jörgen Holmboe, George E Forsythe, and William Gustin. New York John Wiley & Sons Inc., 1945 378 p illus 22 cm $6 50 1024

Contents Dimensions and units. Thermodynamics of a perfect gas. Thermal properties of water substance and moist air Hydrostatic equilibrium. Stability f hydrostatic equilibrium. The equation of motion. Horizontal flow Wind variation along the vertical. Wind variation along the vertical in the surface layer Mechanism of pressure changes. Circulation and vorticity Theory of waves in zonal current. Index.

Note A basic textbook designed for use by students who are preparing for professional careers in meteorology The treatment is *largely mathematical and thus requires previous knowledge of calculus and college physics.* The first half of the volume is discussion f physical principles, particularly thermodynamics and hydrodynamics, which are the bases of dynamic meteorology Remaining chapters relate these principles to the study of atmospheric behavior There are no problems for the student to solve, and since th work is beginning one, only very few references are given. The senior author is associated with the Department of Meteorology University of California at Los Angeles.

HUMPHREYS, WILLIAM JACKSON

Ways of the weather a cultural survey of meteorology New York The Ronald Press 1942 400 p illus 25 cm (Humanizing science series) $4 00 1025

Contents. Weather perceptions. Weather measurements. The atmosphere origin and composition. Structure of the atmosphere. Distribution of temperature. Distribution of water vapor Distribution and changes of atmospheric pressure Wind. Precipitation. Atmospheric electricity Weather music Atmospheric optics. Climate, present and past. Weather control. What of it? Meteorological mileposts.

Note. A popular book for the reader who is seeking an intelligent layman's understanding of meteorology and its importance to man. Without recourse to mathematics it discusses the chief problems of weather and climate and dispels many popular fallacies.

JACOBS, WOODROW C

Wartime developments in applied climatology Boston The American Meteorological Society 1947 52 p illus (part col d) (Meteorological monographs editor E Wendell Hewson Vol 1 no 1, August, 1947) $1 00 1026

Contents Introduction. Types of weather problems in staff planning. Climatological techniques for military problems with reference to civilian application. Climatology for forecasters. The *accumulating, processing, and filing* of basic climatological data. Bases for a "synoptic" or "synchronous" climatology Problems associated with the presentation of climatic information. Conclusions. References.

Note Described in this publication are a number of military applications of climatology that were made by the United States of America during World War II. The applications include predictions of weather over military targets, estimating the probability of fresh-water supply from rainfall in particular Pacific areas at chosen parts of the year and the predicting of trajectories of free balloons released in Japan during specific months of the year Toward the end of the monograph, *the author makes a plea for* more application of climatologic knowledge and techniques in times of peace.

JOHNSON, JOHN C

Physical meteorology New York Published jointly by the Technology Press of the Massachusetts Institute of Technology and *John Wiley & Sons, Inc.,* 1954 393 p. illus. 24 cm $7.50 1027

Contents Atmospheric refraction. Scattering in the atmosphere. Theory of atmospheric visibility Radiation processes in the earth's atmosphere. Radiation studies and the heat budget of the earth. Refraction and diffraction by atmospheric suspensoids, atmospheric optics. The physical conditions attending the formation of cloud particles. Natural and artificially stimulated precipitation, icing of aircraft, and radar meteorology Atmospheric electricity The ionosphere and the exosphere. The temperature, density pressure and humidity of the upper atmosphere. Appendix. Index.

Note The subject of this book has been described by the author as follows. "Physical meteorology is a fringe study investigating those meteorological phenomena not directly linked with the circulation of the atmosphere. Admittedly wide, it connects meteorology with other branches of science. Developed in teaching an undergraduate course at the Massachusetts Institute of Technology the book is text designed for third- or fourth-year undergraduate students who are preparing for careers in meteorology A knowledge of basic physics and calculus is assumed. Well-selected reference lists are included in the chapters. In addition to its use by students, the book is useful to graduate meteorologists both as survey of fundamental knowledge and as guide to important research papers. Also, such chapters as that on radiation processes in the earth's atmosphere are potentially of value to scientists and engineers in fields other than meteorology

KIMBLE, GEORGE H T

Our American weather Maps and charts by Jean Paul Tremblay New York McGraw Hill Book Company, Inc., 1954 322 p. illus 21 cm $4 75 1028

Note. A book of interesting miscellaneous information about climate and weather written by an author who is not only an internationally known geographer and meteorologist but is also gifted writer The arrangement is chronological throughout the year with each of the twelve chapters bearing the name of month Under January—to take an example—one finds not only data on January weather but also discussions of tangential topics, such as the resistance of various species of trees to damage by ice storms Under December some topics are "The shortest day is not the coldest, "The odds on a white Christmas, and "What Florida has on California—and vice versa Not systematic enough to be classed as reference tool, the book contains nevertheless considerable data of reference nature, and the index is sufficiently detailed to make them quickly accessible.

KOHLER, M A , AND OTHERS

Evaporation from pans and lakes By M A Kohler, T J Nordenson and W E. Fox. Washington D C. Government Printing Office 1955 21 p 26 cm (United States Weather Bureau Research paper no 38) $0 20 1029

Contents (abridged) Introduction. Pan evaporation and meteorological factors. Estimation of annual lake evaporation. Summary and conclusions. Future studies. References.

Jet stream formation and maintenance. References. Index. Jet stream research, 1953–54. References (continued).

Note The first seven chapters of this publication are based on a series of lectures which was planned as a critical summary of the extant knowledge of the jet stream as of 1951. The lectures were first published in June, 1951, by the United States Navy Department as NAVAER Report 50-1R-249 and have been reprinted in this volume essentially without change. They outline the accumulated knowledge concisely and relate it to surface weather phenomena and weather forecasting. One-hundred-fifteen references to the literature follow this group of chapters. The eighth chapter —which is not one of the original lectures—is devoted to advances made in the years 1952–1953–1954 in the knowledge of the jet stream. Appended to this supplementary part is a supplementary list of 34 literature references, including publications that were issued in 1954.

RIEHL HERBERT

Tropical meteorology New York Mc Graw Hill Book Company Inc., 1954 392 p illus. 24 cm. $8.50 1042

Contents Winds and pressure. Temperature. Rainfall. Diurnal and local effects. Convection. The physics of tropical rain, by R. Wexler. Weather observations and analysis. Divergence and vorticity. Waves in the easterlies. Survey of low-latitude disturbances. Tropical storms. The general circulation. Name index. Subject index.

Note Readers of this book are assumed to be acquainted with accepted temperate zone meteorology hence practically all of the space has been devoted to the meteorological processes of "that part of the world where most of the weather sequences differ distinctly from those of the middle latitudes. Since tropical meteorology is a relatively new field of research, much of the book is based on observations of the last two decades, and especially on research conducted during World War II. The book thus complements the standard meteorological literature. It was written primarily for use as a college text. In addition to use by students it is useful to graduate meteorologists in need of an introduction to this special field. Extensive reference lists are included.

SARGENT F., II, AND R. G STONE, editors

Recent studies in bioclimatology a group. With a preface by Jacques M May Boston The American Meteorological Society 1954 121 p. illus. 28 cm. (Meteorological monographs editor E. Wendell Hewson. Vol. 2 no. 8 October 1954) $5.00. 1043

Contents Climate in relation to crops, by C. W Thornthwaite and J. R. Mather Weather and climate in forest entomology by W. G. Wellington The climatic physiology of farm animals, by J. D. Findlay Biophysical adaptations of man under climatic stress, by L. P Herrington. Effects of sunlight on man, by H. F Blum. Man, climate, and changes of altitude, by C. Monge M. Organic responses to cosmic rays and their secondaries, by O. Buell and [illegible]. Season and the metabolism of fat and carbohydrate—a study in vertical physiology by F Sargent, II. Bioclimatology of housing, by H. Landsberg. Thermal comfort as a criterion for the classification of climates, by K. Terjung. The geography of disease, by J. M. May Smog and human health, by J H. Foulger. Glossary, by F Sargent, II.

Note Collected in this publication are original brief monographs on aspects of the relations between climate and living organisms. All of the monographs are written in technical terminology and are addressed to climatologists, biologists and other scientists. Selected ones, for example, Foulger's "Smog and human health," are of interest to physicians and public health authorities. Literature references are included in all of the monographs. The publication appears under the auspices of the Committee on Bioclimatology of the American Meteorological Society

SAUCIER, WALTER J

Principles of meteorological analysis Chicago University of Chicago Press, 1955 438 p. illus. 25 cm. (The University of Chicago Committee on Publications in the Physical Sciences Walter Bartky and others) $10.00. 1044

Contents A review of the atmospheric variables. Meteorological charts and diagrams. Hydrostatics and static stability. Theory and practice of scalar analysis. Graphical analysis and computations. Cross-section analysis. Isobaric analysis. Isentropic analysis. Analysis of the surface chart. Kinematic analysis. Certain aspects of broad-scale analysis. Local analysis. Brief survey of analysis in the tropics. Appendix. Index.

Note An intermediate-level textbook designed for the instruction of college students who are majoring in meteorology and have completed introductory courses in physics, thermodynamics, and meteorology. It presents an integrated, detailed exposition of weather analysis. In the teaching, the physical background is always present, but the improvisations that the practical weather analyst must often make are also explained. The author began writing the book when he was a member of the faculty of the University of Chicago, and its scope and organization reflect the significant changes in the teaching of meteorology at the University of Chicago in the last decade.

SHAPLEY HARLOW, editor

Climatic change evidence causes and effects. Cambridge, Mass Harvard University Press, 1954 318 p illus 24 cm. $6.00 1045

Contents On climate and life, by H. Shapley Climate and man, by C. S. Coon. Climate and civilization, by P. B. Sears. Atmospheric and oceanic circulation as factors in glacial-interglacial changes of climate, by H. C. Willett. Radiation balance of the earth as a factor in climatic change, by H. Wexler. The insufficiency of geographical causes of climatic change, by J. Weisbach. On the causes of the ice ages, by D. H. Menzel. Solar variation as an explanation of climatic change, by R. Bell. Internal constitution of the sun and climatic changes, by P. L. Bhatnagar. Interstellar matter and the solar constant, by M. Krook. The astronomical theory of climatic changes, by A. J. J. Van Woerkom. The polar wandering and changes in the earth's orbit, by D. Brouwer. Evidence from glacial geology as to climatic variations, by R. F Flint. Geologic evidence of late pleistocene climates, by J. T Hack. Pedogenic criteria of climatic changes, by C. C. Nikiforoff. Climatic changes and radiocarbon dating, by J. L. Kulp. Tree-ring evidence for climatic changes, by E. Schulman. Climatic changes as interpreted from meteorological data, by J. R. Conover Climatic changes or cycles, by V Conrad. Evidence of climatic change in the geologic record of plant life, by E. S. Barghoorn. The record of climatic changes as revealed by vertebrate paleontology by E. H. Colbert. Paleoecology and climate, by E. S. Deevey

Note The breadth and range of modern climatology are well illustrated by the papers in this book. The 22 papers were first presented at a conference sponsored by the American Academy of Arts and Sciences, in May 1952. The authors are professional scientists working in meteorology and other fields, and primarily they addressed themselves to other scientists. However the papers vary in technical difficulty many of them being quite within the scope of the mature lay reader.

SMITHSONIAN INSTITUTION

Smithsonian meteorological tables. Sixth revised edition. Prepared by Robert J List. Washington, D C. The Smithsonian Institution, 1951 527 p. illus. 24 cm. (Smithsonian miscellaneous collections. Volume 114 Publication 4014) $4.00. 1046

Contents (abridged) Introduction. Section I, Conversion tables. Section II, Wind and dynamical tables. Section III, Barometric and hypsometric tables. Section IV Geopotential and aerological tables. Section V Standard atmosphere and altimetry tables. Section VI, Thermodynamic tables. Section VII, Hygrometric and psychrometric tables. Section VIII, Tables of miscellaneous physical properties of air and airborne particles. Section IX, Tables of miscellaneous properties of water substance and soils. Section X, Radiation and visibility tables. Section XI, Geodetic and astronomical tables. Index.

Note A standard collection of tables used as a reference book by students of meteorology practicing meteorologists, and other scientists in need of accurate data on the atmosphere, weather and related subjects. In comparison to the fifth edition published in 1939 this sixth edition has not only been thoroughly revised but is much more comprehensive. The data have been critically selected, and the regulations of the International Meteorological Organization current at the time of compilation, 1949 have been followed as far as possible. The numbers of tables in the various sections in the sixth edition are: Section I, 111 Section II, [illegible] Section III, [illegible] Section IV 14 Section [illegible] Section VI, 11; Section VII, 17; Section VIII, 14; Section IX, 11; Section X, 11; and Section XI, 14.

NEUBERGER, HANS HERMANN

Introduction to physical meteorology University Park, Pa. Pennsylvania State University, 1951 271 p illus 24 cm. $3 50 1036

Contents Condensation processes in the atmosphere. Visibility in meteorology *Solar and terrestrial* radiation. Meteorological acoustics. Meteorological optics. Atmospheric electricity Appendix. General references. Index.

Note. An introduction to the physical processes of the atmosphere written for college students and others who possess a basic understanding of college physics and algebra. Only those classes of phenomena named in the chapter titles are covered, and there is no discussion of thermodynamics. On the other hand, clear statements are given of the current knowledge of such phenomena as condensation nuclei. The chapters contain reference lists to which statements in the text are keyed. There are 109 figures and approximately 70 tables. The author is Professor of Meteorology in the Pennsylvania State College.

NEUBERGER, HANS HERMANN, AND F BRISCOE STEPHENS

Weather and man New York Prentice Hall, Inc., 1948 272 p illus 22 cm. $3 75 1037

Contents Introduction. Part I, What is weather? The atmosphere. Energy earth, and air Weather elements. Atmospheric properties and processes. Air masses. Fronts. Atmospheric circulation. Weather phenomena of stable air Weather phenomena of unstable air Destructive storms. Climate. The U S. Weather Bureau. Amateur weather forecasting. Part II, Why do we care?: Weather and health. Weather and agriculture. Weather and architecture. Weather and aviation. Weather shipping, and transportation. Weather and public utilities. Weather and the housewife. Weather business, and industry Suggested reading material. Abbreviated psychrometric table. Index.

Note Weather phenomena and their importance are the subject of this book for general readers. The authors have done an excellent job of explaining in everyday language such terms as "dew-point, adiabatic process, "occluded cold front, and "cyclone" and of relating the weather and weather forecasting to daily living. In passing, they also debunk number of weather forecasting gadgets such as the so-called Swiss Weather House.

NEWELL, HOMER, E , JR.

High altitude rocket research New York Academic Press Inc., 1953 298 p illus. 23 cm $8 50 1038

Contents Introduction. The rocket as a research vehicle. Recovery of data. Pressures, densities, and temperatures in the upper atmosphere. Winds in the upper atmosphere. Rocket measurements of solar radiation. Composition of the high atmosphere. The ionosphere and the earth's magnetic field. Cosmic rays. High-altitude photography Name index. Subject index.

Note A pioneer survey of the uses of rockets as research vehicles in making studies of and in the upper atmosphere. The techniques of using rockets in upper atmosphere research and their potentialities are the primary themes. However some historical information is included—for instance there is an eight-page tabulation of data on the individual firings of research rockets in the *United States of* America from 1947 through 1952 Also, considerable space is devoted to data already collected by the use of rockets. The presentation ranges from semitechnical to technical. The book is particularly suited to reading by scientists in fields *other than high altitude* research who wish to learn about the potentialities of this relatively new technique and by laymen who have done enough reading in the field to have become familiar with the terminology *References to the literature down to early 1953 are included.*

PETTERSSEN, SVERRE

Weather *analysis and forecasting* Second edition New York McGraw Hill Book Company, Inc 1956 2 v illus 23 cm. Vol I $8 50, vol. II $6 00 1039

Contents. Volume I, Motion and motion systems Basic equations. Kinematics of quasi-horizontal motion. Kinematics of the pressure field. Wind in relation to pressure. Influence of friction. Vertical structure of wind systems. Circulation and vorticity Theory of long waves. Extension of the theory of upper waves. Computation of the movement of pressure systems. Fronts and frontogenesis. Structure of extratropical cyclones and anticyclones. Behavior of cyclones and anticyclones. Vertical velocity and divergence. Instability theories of cyclone formation. Development of cyclones and anticyclones. Examples of cyclone development. Numerical forecasting. Graphical integrations. Appendixes. Name index. Subject index. Volume II, Weather and weather *systems: Production and* transformation of air masses. Temperature and humidity relationships. Clouds and precipitation. Quantitative precipitation forecasting. Mist fog, and stratus. Convective clouds and weather. Weather systems. Local forecast studies. Application of synoptic climatology to weather prediction. Appendix. Name index. Subject index.

Note. The first edition of this title was published in 1940 and was contained in one volume. It bore the subtitle, A textbook on synoptic meterology The preface to this second edition contains the following statement: the time has come for a reorientation for the training of forecasters. This reorientation should aim at minimizing (and, if possible, eliminating) the difference between what is commonly called *synoptic* and *dynamic* meteorology The purpose of this second edition is to provide a text for such training. The work has been completely rewritten in accordance with the new viewpoint. In its new version it provides a general comprehensive introduction to present-day forecasting concepts and techniques. Only specialities, such as tropical meteorology and empirical techniques useful in limited regions, are omitted. It is addressed to advanced students who are preparing for careers in weather forecasting and is of interest also to graduate meteorologists already at work in the field. Selected literature references are included.

RIEHL, HERBERT, AND OTHERS

Forecasting in middle latitudes. By Herbert Riehl and J Badner J E Hovde, N E. La Seur, L L. Means, W C. Palmer, M J Schroeder, L. W Snellman and others. With a foreword by Francis W Reichelderfer Boston The American Meteorological Society, 1952 80 p. illus. 28 cm (American Meteorological Society Meteorological monographs. Vol I, no 5) $3.50 1040

Contents Introduction. The upper-air prognostic chart. The surface prognosis. Field example, 1–4 November 1950 (stage NIII) Appendices. Calculation and representation of the zonal wind profile. Preparation of the continuity chart. Long-wave calculations. Calculation of the dynamic stability in ridges. Computation of the 24-hr 500-mb prognosis. Jet stream analysis. Computation of the 24-hr jet stream prognosis. Computation of the vorticity field aloft. Relations between changes of surface pressure and changes of vorticity aloft. Trajectory method of displacement. References.

Note The mechanics and computations of contemporary weather forecasting for short periods such as 48 hours are illustrated in this work. The method chiefly *considered is the construction* of prognostic charts "on the basis of experience, empirical rules, and some kinematic and dynamic computations. The *forecaster* is shown first how to draw an upper-air prognostic chart, then how to use *this and other information in drawing a* 48-hour surface prognostic chart. The booklet is based on a course sponsored by the University of Chicago and conducted at the Chicago Weather Bureau Forecast Center since 1930. It is written in the technical terminology *of the field and is* addressed both to advanced college students and to graduate *meteorologists.* A particularly valuable feature is the relation of specific steps in the prognosis to papers bearing on them in the modern literature.

RIEHL HERBERT, AND OTHERS

The jet stream By H Riehl M A Alaka, C L Jordan and R. J Renard With a foreword by F A. Berry Boston The American Meteorological Society 1954 100 p illus 28 cm (Meteorological monographs editor E Wendell Hewson Vol 2, no 7, August, 1954) $3 50 1041

Contents: Introduction. *Synoptic* structure of the jet stream. Climatology of the jet stream. The jet stream in relation to middle latitude cyclones. The jet stream in relation to extended forecasting. High level wind analysis. *Dynamic* principles relating to

Arid climates. Climatic variations. Literature cited. Selected list of references. Plates: Average annual precipitation over the earth. Climatic regions over the earth. Areal distribution of principal climates in the United States, annual. Areal distribution of principal climates in the United States, crop season. Climates of the United States for each year from 1900 to 1939 (annual climates, crop-season climates). Frequency of arid climates (annual and crop season). Frequency of semiarid and drier climates (annual and crop season). Frequency of dry-subhumid and drier climates (annual and crop season). Frequency of moist-subhumid and drier climates (annual and crop season). Frequency of humid climates (annual and crop season). Frequency of superhumid climates (annual and crop season).

Note: The maps in this atlas are restricted to [illegible] presentation of the ordinary forms of climate and show the normal position of the principal climatic types, their variation in pattern from year to year, and the frequency of occurrence of the various individual climates. From [illegible] study of these colored maps of the United States, of which there are 96 arranged two to [illegible] page, an appreciation of the diversity of the patterns of soil and water conservation in the different parts of the country may be obtained.

TREWARTHA, GLENN T

An introduction to climate. Third edition. New York. McGraw Hill Book Company Inc., 1954 402 p. illus. 26 cm. (McGraw Hill series in geography John C. Weaver consulting editor) $7 5 1054

Contents: Part i, The elements of climate: Air temperature (including insolation). Atmospheric pressure and winds. Atmospheric moisture and precipitation. Air masses and fronts. Atmospheric disturbances and their associated weather types. Part ii, The world pattern of climates—climatic types and their distribution. Classification of climates and the world pattern. The tropical rainy climates. The dry climates. The humid mesothermal climates. The humid microthermal climates. Polar climates and highland climates. Appendixes. Köppen's classification of climates. Supplementary climatic data for selected stations. Index.

Note: A standard college text. It is well organized and is written in [illegible] style which puts it within the reach of persons [illegible] students as well as students. The two parts are approximately equal in length. The first covers the basic principles and phenomena, the second describes the types of climates of the world. It [illegible] generously illustrated, mainly with graphic representations of data bearing on climate. In this edition, as compared with the preceding one published in 1943, there is considerable new matter, including the newly added chapter on classification of climates, but also including many new sections in chapters whose titles are the same as in the second edition. Illustrations and literature references have also been revised.

UNITED STATES. HYDROGRAPHIC OFFICE

Bibliography on ice of the northern hemisphere the bibliography for H. O Pub. No. 550, *Ice atlas of the northern hemisphere* now in preparation by the Hydrographic Office, to which has been added an index of authors subjects and places. Washington, D C. Government Printing Office 1945 179 p. 26 cm. (United States. Hydrographic Office. H. O pub no. 240) $2.00 1055

Contents: Abbreviations of periodicals. World-wide references. Geographic divisions. General references. Addenda. Index of subjects. Index of names. Index of geographic names.

Note: A bibliography of the pertinent international literature, including numerous publications of the U.S.S.R. The bulk of it is organized under geographic regions such as the Arctic Ocean, Greenland Sea, East Siberian Sea, Hudson Bay and Strait, Great Lakes, Yellow Sea, and rivers and lakes of North America. Within each division, the arrangement [illegible] alphabetical by author's name. The information given for each entry includes year of publication, title, and the customary citation of journal, volume number, pages, etc. In some instances, there is [illegible] very brief explanatory annotation. Another useful feature is the inclusion of English translations of Russian titles.

UNITED STATES. HYDROGRAPHIC OFFICE

Ice atlas of the northern hemisphere. Corrected reprint. Washington, D C. Published by the Hydrographic Office United States Navy 1955 106 p. illus (part col d) 51 cm. $5.00. 1056

Contents: Northern hemisphere. Grand Banks region. Baltic Sea. Kara Sea. White Sea. Okhotsk Sea region. Bibliography.

Note: This important publication consists primarily of charts designed to show average ice conditions month by month for each of the regions covered. Five types of ice, classified from the standpoint of navigation, are recognized, and their ranges are indicated on the charts. The first edition was published in 1946. In the corrected reprint new definitions for the types of ice are published, and there is [illegible] short additional bibliography. The original bibliography is also available separately as described in the preceding entry.

UNITED STATES WEATHER BUREAU

The climate of the Matanuska valley Prepared by Robert F Dale. Washington, D C., Government Printing Office, 1956 26 p. illus. 26 cm. (United States. Weather Bureau. Technical paper no. 2) o.p. 1057

Contents: Introduction. General features. Temperature. Precipitation. Drought. Evaporation. Cloudiness. Solar radiation and day length. Local winds. Matanuska winds. Knik winds. Joint occurrence of Matanuska and Knik winds. Aviation and dewpoints. References.

Note: A detailed study of the climate of the Matanuska valley in Alaska. It is based on seven series of observations with the longest one about 34 years, and other averaging more than 11 years in length. Considerable interest in the Matanuska valley as [illegible] potential agricultural region inspired the study and the discussion of the data that accompanies the tabular and graphical representation makes frequent reference to agriculture, agricultural. Aside from the agricultural interest, however, the publication is an outstanding example of [illegible] climatological study of [illegible] relatively small area.

UNITED STATES WEATHER BUREAU

Hurricane rains and floods of August 1955 Carolinas to New England. Prepared under direction of Paul H. Kutschenreuter Washington, D C. Government Printing Office 1956 145 p. illus 26 cm. (United States. Weather Bureau. Technical paper no. 26) $1.00. 1058

Contents: Part i, Meteorological analysis. Introduction. Broadscale weather patterns. Beginning of the heavy rain in Virginia—August 12 1955. First day of rains in southern New England—August 18, 1955. Final day of rains in New England—August 19 1955. Rainfall mechanisms. Rainfall comparisons. Conclusion. References. Part ii, Floods. Introduction. Basic hydrometeorological data. Description and causes of August 1955 floods. Floods in southern New England. Floods in southeastern New York. Floods in New Jersey and eastern Pennsylvania. Floods in Maryland, Virginia, and West Virginia. Floods in eastern North Carolina. Flood and damage summary. Part iii, Precipitation data. Introduction. Hourly precipitation data, August 1955. Daily precipitation, August 1955.

Note: An exhaustive analysis of the meteorological conditions which produced rains and floods of record proportions in [illegible] regions of the United States of America in August, 1955, combined with the basic hydrometeorological data and the precipitation data pertinent to the storm and the subsequent floods. The data presented are exceptionally detailed, and include hourly records of precipitation for [illegible] large number of observation stations. The illustrative matter includes [illegible] number of photographs showing the flood damage.

UNITED STATES. WEATHER BUREAU

Instructions for cooperative observers. Circulars B and C, Instrument Division. Ninth edition (revised 1941) Washington, D C.

TANNEHILL, IVAN RAY

Drought, its causes and effects Princeton Princeton University Press, 1947 264 p illus. 19 cm $3 75 1047

Contents Preface. Introduction—Choosing a point of view Droughts and the menacing deserts. Famine. Droughts in the United States. Dusters and black blizzards. What makes it rain? Why doesn't it rain? The monster in the back yard. The drought comes over the mountains. November droughts and the G.B.A. What about the great plains? Hot sun and cool water The atmosphere and its moisture. What about sunspots? What makes the ocean cold? Do droughts come in cycles? Trends and oscillations. Can we control the climate? Is our climate changing? Droughts through the ages. Causes of drought—a summary Appendix, Weather records Normal rainfall and temperature Average precipitation amounts by states for each month. Charts of normals (Figs. 113 to 118) National rainfall, 1886–1945 Percentages of normal rainfall by months and years for the United States as a whole, 1886–1945 Percentages of normal annual rainfall for states east of the Mississippi River Percentages of normal annual rainfall for states between the Mississippi River and the Rocky Mountains. Percentages of normal annual rainfall for states from the Rocky Mountains westward to the Pacific coast. Bibliography Index.

Note The author's chief purpose in this book has been to assist in establishing a method whereby droughts can be predicted. He has advanced the theses that variations in solar radiation are translated into rainfall variations, and that rainfall in the United States is dependent on relatively low temperatures over the northern continent and relatively high temperatures over the northern Pacific Ocean. These theories are developed through a study of the various meteorological processes that affect rainfall. The writing is simply phrased and is intended for meteorologists—both professional and amateur—and for farmers.

TANNEHILL, IVAN RAY

The hurricane hunters Illustrated with photographs New York Dodd, Mead & Company, 1955 271 p illus. 21 cm. $3 00 1048

Contents Monsters of the world of storms. The soldier's apprentice. At the bottom of the sea. Storm warnings. Radio helps—then hinders. The eye of the hurricane. First flight into the vortex! The hammer and the highway Wings against the whirling blasts. Keppler's hurricane. Tricks of the trade. Trailing the terrible typhoon Guest on a hairy hop. The unexpected. Fighting hell and hurricanes. Carol, Edna, Hazel or Sadly! The tears and grits of the ghost.

Note. The author's Hurricanes their nature and history is well known. Although this new book contains much about the behavior of hurricanes, its primary topic is the gradual development of hurricane forecasting and tracking. The story begins with Columbus who learned a good deal about hurricanes in his voyages to the West Indies. Only the high spots of the story are touched on, *up to July 27 1943* when Joseph B Duckworth, a veteran pilot and an expert in instrument flying, made the first airplane flight into the eye of a hurricane. From this point on, the parts, sometimes separate, sometimes integrated, played by the Weather Bureau the United States Air Force and the United States Navy flyers are recounted in considerable detail. The book is written in a spirited style and is intended for general reading. It has little value for reference, for no sources are given, and there is no index.

TANNEHILL, IVAN RAY

Hurricanes, their nature and history particularly those of the West Indies and the southern coasts of the United States. Ninth edition Princeton Princeton University Press, *1956 308* p illus *22 cm* $4 50 1049

Contents Introduction—tropical cyclones. Winds of the hurricane. The storm wave. Origin of West Indian hurricanes. Hurricane tracks. Rainfall in tropical cyclones. Barometric pressures. Signs of the approaching hurricane. Unusual hurricane movements. Frequency of West Indian hurricanes. Destructive effects of hurricanes. Precautionary measures. *Early history of West Indian hurricanes. Memorable hurricanes* of the nineteenth century Chronological account of hurricanes of the twentieth century Chronological list of hurricanes, 1494 to 1900 Appendix Observing and forecasting hurricanes. Bibliography Index.

Note The standard work of information about the meteorology and records of hurricanes. The style is semitechnical, and the book appeals both to general readers and to professional meteorologists. Much reference information on particular hurricanes is included.

TANNEHILL, IVAN RAY

Weather around the world. Second edition. *Princeton Princeton University Press, 1952* 212 p illus 20 cm $2.50 1050

Contents Wind and waves. Clouds. Prevailing winds, barometers and the law of storms. Ocean currents, temperatures and climate. Heat and humidity Cloudiness, rain, snow and fog. Special phenomena over the oceans. Europe. West Indies and South America. The Mediterranean and the Middle East. Africa. Asia. Australia and the Pacific Islands. North America. The weather shelf. Appendix, Weather records around the world A. Weather records for 110 cities. B Supplementary weather records for 75 places. C, Wind and weather for ocean crossings. Indexes.

Note A handy readable book addressed to travelers and other laymen It is useful also as a weather reference book in personal libraries. The first seven chapters deal with weather phenomena in general and include both unusual facts, such as the height of the tallest waves, and information about more routine matters, such as varieties of clouds. The remainder of the book (except for the final chapter) is devoted to the weather of particular regions of the world. The first edition was published in 1943. The main change in the present edition is the addition of the final chapter on the weather and travel by air

TAYLOR, GEORGE F

Elementary meteorology New York Prentice-Hall, Inc , 1954 364 p illus. 24 cm. $5 95 1051

Contents The setting. Components of the weather Composition and vertical structure of the atmosphere. Heat temperature, and moisture in the atmosphere. Atmospheric pressure and basic pressure patterns. Wind and atmospheric circulation. Condensation and precipitation. Clouds and fog. Air masses. Fronts and storm structure. Violent local storms. Weather in the tropics. Weather charts and diagrams. Weather forecasting. Climatology Appendixes. Index.

Note A well-rounded introduction to weather phenomena and to the principal ideas and techniques of present-day meteorology and weather observation. *A range of information is covered, from an outline of Gamow's hypothesis on the origin of the universe to* discussion of whether the climate of the earth is slowly warming up. The book is not, however a popularization. It is primarily a textbook suited to the needs of college students who are interested in meteorology as a career and also to students of other sciences who desire a basic understanding of meteorology and its methods. The appendices contain reference information such as meteorological codes, conversion tables, and the constants of the standard atmosphere.

THIESSEN, ALFRED HENRY, compiler

Weather glossary Washington D C. Government Printing Office 1946 299 p *23½ cm. (W B no 1445)* $1 00 1052

Note An excellent and useful dictionary issued under the auspices of the United States Weather Bureau. *It is based on word usage as found in American meteorological works. In most instances* the definitions are expressed in terms of scientific meteorology rather than in the common language therefore the work is more suitable for use by professional meteorologists than general reference use. An occasional definition runs to a page in length but the typical definition is only six or eight lines long. References are given frequently to fuller discussions of specific terms in standard texts and reference books.

THORNTHWAITE CHARLES WARREN

Atlas of climatic types in the United States *1900–1939* Washington D C Government Printing Office 1941 58 p illus. 47 cm (United States Department of Agriculture. Miscellaneous publication no 421) o p 1053

Contents Introduction. The evolution of the climatic pattern. Vegetation as a climatic indicator The determination of effective precipitation. The climates in the United States Superhumid climate Humid climate. Subhumid climate. Semiarid climate

tals, Wisconsin, Wyoming, Alaska, Territory of Hawaii, Puerto Rico.

Note: Presented in this publication are rainfall intensity-duration curves for durations from five minutes to 24 hours, and return periods of 2, 5, 10, 25, 50, and 100 years for each of 203 U. S. Weather Bureau stations located in the states and other subdivisions whose names are given in the above Contents.

UNITED STATES. WEATHER BUREAU

The thunderstorm report of the Thunderstorm Project (a joint project of four U S. Government Agencies Air Force, Navy National Advisory Committee for Aeronautics and Weather Bureau) Horace R. Byers, director Roscoe R. Braham, jr., senior analyst. Washington D C. Government Printing Office, 1949 287 p. illus. 26 cm. $2.25 1066

Contents (abridged) Introduction. History of the Thunderstorm Project. Design of the observational system. Areas of operations. Character of data obtained. Part one. Description of the thunderstorm. Thunderstorm structure and circulation. Turbulence and hydrometeors within the thunderstorm. Thunderstorm weather near the surface. Electric fields inside the thunderstorm. The thunderstorm as disclosed by radar. Effect of environment wind field on existing thunderstorms. Preferred areas of thunderstorm development. [illegible]. Part II. Flight operations in thunderstorm conditions. Part III. Examples. References. Appendices Surface instruments. Cooperative [illegible]. Radar equipment. Airplane instruments. Photography. Index.

Note The final report of a research project which was set up in 1945 to make a thorough study of thunderstorms. The project was active from late in 1945 to the early months of 1949 and issued a number of partial reports and other publications, a list of which is given in the present report. Very extensive field investigations were carried on in the course of the research, and the data collected are synthesized in Part I. Part III consists of complete sets of data for several individual storms, four of which were observed in August, 1947. The equipment and instruments used in the study are described in the appendix. Considering the report as a whole, important results on the internal structure and circulation of thunderstorms and on associated weather and atmospheric phenomena, and on their effects on airplane flight, are presented.

VAETH, J GORDON

200 miles up the conquest of the upper air Second edition. New York The Ronald Press Company 1955 261 p. illus. 24 cm. $5.00. 1067

Contents: The upper atmosphere—a frontier of scientific exploration. The atmospheric ocean. Upper air research instruments. Vehicles for upper air research. Project skyhook—upper air research by balloon. The White Sands proving ground. Principles of rocket flight. The V-2—forerunner of modern high altitude rocketry. The high-flying Aerobee. The Viking. The future and the upper air. The unmanned satellite. Beyond the earth. Index.

Note A standard book for lay readers about present-day techniques of investigating the phenomena of the earth's upper atmosphere. The principal vehicles, sounding balloons, "sky hook" balloons, and rockets for carrying the measuring and recording instruments into the upper atmosphere are also described. No classified information is included; nevertheless, there is a wide range of detailed information about rockets such as the Viking and the heights they have achieved. A first edition of the book was published in 1951. The three terminal chapters of this second edition are new additions. Also, changes have been made where necessary in the chapters carried over from the first edition: for instance, the chapter on the Viking has been considerably revised. Some new illustrations have been added. A "revised printing" issued in 1956 contained additional information to that in the second edition on the earth satellite development program in the United States of America.

VISHER, STEPHEN SARGENT

Climatic atlas of the United States. Cambridge Mass. Harvard University Press 1954 403 p. illus. 30 cm. $9.00 1068

Contents: Introduction—summary. Part I. Temperature: Normal temperatures—annual, seasonal, monthly: contrasts, departures. Normal weekly mean temperatures. Normal daily maximum and minimum temperatures for alternate weeks. Temperature [illegible]. Killing frosts; growing season. House-heating requirement contrasts. Relatively high temperatures. Relatively low temperatures: frost frequency and penetration. Temperature ranges—diurnal, seasonal, annual, extreme. Sudden changes of temperature—cold waves, hot waves, chinooks. Part II. Winds, atmospheric pressure, storms. Atmospheric pressure. Winds—average velocities and directions. Air mass movements. Storms—cyclones, thunderstorms, tornadoes, hurricanes, anticyclones. Other winds—sea, lake and land breezes, valley winds, squalls, [illegible]. Part III. Sunshine. Normal amounts of sunshine, cloudiness, fog, radiation. Part IV. Atmospheric humidity and evaporation. Relative and absolute humidity and vapor pressure. Evaporation—amounts and ratios. Part V. Precipitation. Normal amounts of precipitation—annual, seasonal, monthly, semimonthly, daily. Normal amount of precipitation received in alternate weeks. Normal shifts in amount of precipitation—seasonal, monthly, semimonthly. Normal amounts of snowfall, hail, "excessive" rains, prospects of early rain. Normal rainfall intensity. Normal runoff and absorption (ground water recharge). Exceptionally wet years, seasons, months, spells—amounts. Exceptionally dry years, seasons, months, spells—amounts. Frequencies of dry years, seasons, months. Frequencies of wet years, seasons, months. Precipitation variability—range and ratios, annual, seasonal, monthly. Precipitation [illegible]. Precipitation regions. Part VI. Some consequences of climate and weather. Some consequences of climate and weather on agriculture and health. Some consequences of climate on land and water—soil erosion, topography, lakes, rivers. Part VII. Climatic regions and changes. Climatic regions, on various criteria. Climatic changes and [illegible]. References. Sources of the maps. Index.

Note: Primarily this book is an organized collection of weather maps. Of the 1,031 illustrations, nearly 1,000 are outline maps of continental United States of America, with weather data superimposed in graphical form. About 400 of the maps are original; the others have been adapted from previous publications, mostly government documents. All of the maps are simplified black-and-white drawings, and most of them are 3 inches by 4½ inches in size. Each map is accompanied by a brief, explanatory caption. The book is a useful quick-reference tool for professional meteorologists and other scientists interested in the climate of the United States, and a standard source of information for nonspecialists in climatology such as farmers.

WENSTROM, WILLIAM HOLMES

Weather and the ocean of air Boston Houghton Mifflin Company 1942 484 p. illus. 23 cm. $5.00. 1069

Contents. The air ocean above us. Heights unexplored—the upper atmosphere. Basic sources—the sun and the earth. How weather studies began. The weather instruments. Winds aloft and [illegible]. Sounding the tropospheric depths. Fogs and clouds and showers. Wind-and-climate belts of the world. Air-conditioning on a continental scale—cold and warm air waves. Large-scale storms of the temperate zone—cyclones and fronts. Big wind in [illegible] circle—tropical hurricanes. Thor's symphony—thunderstorms and line squalls. Climax violence of air-tornadoes and waterspouts. Earth's highest frontier—aerology's future. Hidden conquests—solar forces and earthly storms. Amateur aerology. Weather reports, maps, and charts. Forecasting the weather. Industry and agriculture. Forest weather and war weather. On the water—mariners' weather. In the air—aviators' weather. Index.

Note: This is both a descriptive and a practical book by a retired U.S.A. army officer who was for three years meteorological officer at Bolling Field, District of Columbia. Types and manifestations of weather are described, and the science of weather forecasting is explained. Special chapters on weather on the water and weather in the air are designed for yachtsmen and aviators. The book is intended primarily for general readers.

Government Printing Office, 1941 34 p illus 22 cm. (W B no 845) $0 10 1059

Contents: Introduction. Instructions for the erection and care of instruments. The object of temperature readings and exposure of thermometers. General description of thermometers. Instructions for reuniting detached columns of alcohol. Instructions for mounting maximum and minimum thermometers. The rain gage. How to measure rainfall and snowfall. General instructions about instruments. To make and record observations. Temperature records. Precipitation records. Miscellaneous phenomena. Definitions. Form 1009 meteorological, sample monthly record. Earthquakes and instructions for their noninstrumental observation. Importance of earthquake data. Why the Weather Bureau should collect earthquake data. Instructions for the collection of earthquake data. Index.

Note The object of this pamphlet is to furnish instructions to observers co-operating with the Weather Bureau in order that there may be uniformity in the observations. There are about 5,500 co-operative observers in the United States of America. The instructions cover taking and recording meteorological observations, especially of temperature and rainfall, and also reporting earthquakes.

UNITED STATES WEATHER BUREAU

Manual of cloud forms and codes for states of the sky Second edition Washington, D C Government Printing Office, 1949 v p illus 26 cm (United States Weather Bureau. Circular S) $0.30 1060

Contents Definition and description of the forms of clouds: Cirrus. Cirrocumulus. Cirrostratus. Altocumulus. Altostratus. Stratocumulus. Stratus. Nimbostratus. Cumulus. Cumulonimbus. Varieties. Specification of cloud codes CL, CM and CH: Illustrations and discussions of code specifications.

Note An official manual for weather observers and others who are concerned with the coding of cloud states of sky in meteorological reports. It classifies and defines the recognized cloud forms, furnishes both technical and nontechnical specifications for cloud descriptions and in series of 47 plates provides photographic illustrations of the described cloud forms and states of sky The code specifications are those adopted by the International Meteorological Association.

UNITED STATES WEATHER BUREAU

Manual of marine meteorological observations January 1954 (reprinted to include changes 1 and 2 May 1956) Washington, D C. Government Printing Office, 1956 104 p looseleaf illus. 26 cm (United States Weather Bureau Circular M, ninth edition) $1 25 1061

Contents Introduction. General instructions. Identification data. Wind. Visibility Weather Pressure. Temperature Clouds. Waves. Ice. Code tables. Miscellaneous tables. Chart of local time corresponding t Greenwich mean noon. Index.

Note A guide to the taking of weather observations at sea. Systematic weather reports from co-operating ships by mail and by radio provide the basis for the weather forecasts and navigation charts issued to the maritime service by the U S. Weather Bureau. The manual is organized to accord with the order of the various elements of the observation as they are entered in the basic Weather Bureau Form 1210F "Log f ship's weather observations. The first seven editions of Circular M were issued under the title, "Instructions to marine meteorological observers.

UNITED STATES WEATHER BUREAU

Manual of surface observations (WBAN) Seventh edition. Approved by the Weather Bureau, the Air Weather Service of the Department of the Air Force, and the Naval Aerology Branch of the Department of the Navy Washington D C Government Printing Office, 1955 171 p illus 26 cm (United States Weather Bureau Circular N) $0 75 1062

Contents Introduction. Clouds and obscuring phenomena. Visibility Atmospheric phenomena. Precipitation (depth) Temperature. Humidity Pressure. Wind. Types of observations. Coding and dissemination. WBAN 10. Pilots' reports. Marine observations. Index.

Note This technical manual, copiously illustrated with charts and tables, contains instructions for the guidance of Weather Bureau, Air Force, and Navy meteorologists concerned with the making of weather reports. It gives details of methods of taking, recording, and transmitting of surface observations. It is the seventh edition of a publication first issued in 1928 under the title, *Instructions for airway ob ervers* Circular N It is issued in loose-leaf form to allow for the insertion of revised pages as issued.

UNITED STATES WEATHER BUREAU

Monthly normal temperatures, precipitation, and degree days Washington, D C. Government Printing Office, 1956 39 p 26 cm. (United States. Weather Bureau. Technical paper no 31) $0.25 1063

Note. Monthly normals based on records for the 30-year period 1921 1950 inclusive, for temperature precipitation, and degree days are tabulated in this publication for the states of continental United States of America and also for Hawaii, Alaska, and selected islands in the West Indies and in the Pacific. The degree-day normals are derived from the values for the monthly normal maximum and minimum temperature and are computed on the standard base of 65 F

UNITED STATES WEATHER BUREAU

Radiosonde observation computation tables and diagrams Washington, D C. U S Government Printing Office, 1956 119 p. illus. 35 cm. $1.25 1064

Contents Conversion table for wind speed. Fahrenheit to Celsius temperatures. Celsius to Fahrenheit temperatures. Conversion table for inches and millibars. Relative humidity (%) Celsius temperatures. Relative humidity with respect to ice converted to relative humidity with respect to water Distances from surface of given pressure to standard isobaric surface. Distances between standard isobaric surfaces. Distances from a standard isobaric surface to a surface of given pressure. Determination of heights by the barometer Meters into feet. Feet into meters. Table of temperature correction (for reduction of pressures to 1000 mb.) Table of Z for computing altitude of the 1000-mb.—constant-pressure surface. Table of temperature correction (for reduction of pressures to 850 mb.) Table of Z for computing the altitude of the 850-mb. —constant-pressure surface. Proportional parts. Mean values of relative humidity (over water) when electric hygrometer is below its operating range Altitudes in hundreds of geopotential feet as a function of pressure in millibars. Number of minutes to be added algebraically to local standard time to obtain true solar time. Determination of balloon ascensional rates (range 150-60 mb.) Determination of balloon ascensional rates (range 60-10 mb.) Diagrams.

Note A complementary volume to the United States Weather Bureau *Manual of radiosonde observations*, of which revised edition was published in 1957 It contains 20 tables and four diagrams useful in the evaluation of radiosonde observations.

UNITED STATES WEATHER BUREAU

Rainfall intensity-duration frequency curves for selected stations in the United States, Alaska Hawaiian Islands, and Puerto Rico. Washington D C. Government Printing Office 1955 53 p 26 cm (United States. Weather Bureau Technical papers no. 25) $0 40 1065

Contents Introduction. References. Rainfall intensity-duration-frequency curves Alabama, Arizona, Arkansas, California, Colorado, Connecticut, District of Columbia, Florida, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky Louisiana, Maine Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New Hampshire New Jersey New Mexico, New York, North Carolina, North Dakota, Ohio Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, West Virginia

of some volume; the inclusion of information on some topics not represented in the eighth edition, such as the physical properties of the earth, the cosmic abundance of the chemical elements, the physical and chemical properties of plastics as materials of construction, the efficiency of drying agents, and comparison of hydrometer scales; and the revision of the information on 16 subjects represented in the eighth edition. The number of pages is slightly smaller than in the eighth edition, thus the book remains of a size that is conveniently handled.

PATTERSON, AUSTIN MCDOWELL
A French-English dictionary for chemists. Second edition. New York John Wiley & Sons, Inc., 1954 476 p. illus. 19 cm. $6.50. 1076

Note: The first edition of this often used desk reference book was published in 1921. In this second edition no change has been made in the scope of the book. It is a list of the general and basic French chemical terms, rather than a comprehensive vocabulary of the names of chemical compounds. The names of the more common chemicals are included, also terms from the French literary language which would be encountered in reading chemical articles. The total number of terms for which English equivalents are given has increased from about 35,000 to about 42,000.

PATTERSON, AUSTIN MCDOWELL
A German-English dictionary for chemists. Third edition. New York John Wiley & Sons Inc., 1950. 541 p. 18 cm. $6.50 1077

Note: In the present edition a substantial number of terms has been added to the standard reference book, and some new meanings have been added for terms which were included in previous editions. As in earlier editions, the work is a dictionary for chemists rather than of chemistry. Chemical terms constitute the bulk, but common terms from the general language, such as "wyler" and "tell" which might be encountered in reading chemical articles, are included. Also, there are many terms from sciences that border on chemistry.

THE VAN NOSTRAND CHEMIST'S DICTIONARY
Board of editors Jurgen M. Honig, Morris B. Jacobs, S. Z. Lewin, William R. Minrath and George Murphy. Princeton D. Van Nostrand Company Inc. 1953 761 p. illus. 24 cm. $12.00. 1078

Note: A standard reference work of definitions of chemical terms and terms from related fields, such as physics, which are of interest to chemists and are found in chemical literature. The editors did not attempt the impractical task of defining all chemical terms. Instead, they have included a selection of terms of many kinds, including those of chemical elements, type compounds, classes of chemical substances, fundamental laws, named reactions and tests, named and laboratory equipment. Terms including proper names, for example "Tschermak process," are included along with common names. Since the book is intended for the use of chemists and other scientists rather than laymen, definitions are expressed in chemical terminology. A helpful feature is the use of boldface type to indicate terms used in definitions which are defined elsewhere in the dictionary. There are some diagrams of chemical structures, but no other illustrations, not even the expected pictures of instruments. The terms of very specialized areas are, generally speaking, not included. On this point the editors have stated, "The primary objective ... is to furnish to the specialist in any one field the information in all fields up to the level of the specialist."

BIBLIOGRAPHY AND HISTORY

BROWNE, CHARLES ALBERT AND MARY ELVIRA WEEKS
A history of the American Chemical Society seventy-five eventful years. Washington, D. C. American Chemical Society 1952 526 p. illus. 23 cm. $5.00 1079

Contents: Preface and memorial to Dr. C. A. Browne. Precursors. Beginnings. The secession period. The new order. The twenty-fifth anniversary—before and after. Specialization and dangers of dissolution. Strivings for consolidation. International relations, 1876–1914. The American Chemical Society and the First World War. The Society completes its first half century. The start of the Society's second half century. The American Chemical Society during the Second World War. The postwar reorganization. Growth and readjustment. Increasing professional consciousness. International relations, 1918–1951. Contributions of the divisions. Publications. Awards, memorial lectures, and research foundations. The Diamond Jubilee. Chronology. Presidential addresses. Biographical sketches. Appendix: Editors of American Chemical Society journals. General meetings of the American Chemical Society—1876–1951. Honorary memberships. Active divisions—1951. Active local sections—1951. Officers of the American Chemical Society. Name index.

Note: An official history of the principal professional society in the field of chemistry in the United States of America. It covers the Society's development and activities in detail, even including specific information on the volume of circulation of the Society's chief publications. The illustrations include portraits of officers of the Society.

CHYMIA ANNUAL STUDIES IN THE HISTORY OF CHEMISTRY Volume 1. Tenney L. Davis editor in-chief. Philadelphia University of Pennsylvania Press 1948 190 p. illus 24 cm. $3.50 1080

Contents: Recently acquired information concerning Frederick Accum, 1769–1838, by C. A. Browne. A memorial tribute to Dr. C. A. Browne, with a bibliography of his contributions to the history of chemistry, by C. E. Dreicher. The argument of Marius and Merlin—an English alchemical poem, by F. S. Taylor. Thomas Thomson—pioneer historian of chemistry, by H. S. Klickstein. L'école des chimistes français vers 1840, by M. Delépine. Factors which led Mendeleev to the periodic law, by H. M. Leicester. The early use of potassium chlorate in pyrotechny—Dr. Moritz Meyer's colored flame compositions, by T. L. Davis. The early chemical and pharmaceutical history of calomel, by G. Urdang. The concepts of substance and chemical element, by J. R. Partington. Priestley writes the water controversy, by S. M. Edelstein. Scottish alchemy in the seventeenth century, by J. Read. Carl Weltzien and the congress at Karlsruhe, by C. de Milt. Pierre Louis Dulong—his life and work, by P. Lemay and R. E. Oesper.

—— Volume 2 Tenney L. Davis, editor in-chief. Philadelphia University of Pennsylvania Press, 1949 143 p. illus. 24 cm. $4.00 1081

Contents: The beginnings of laboratory instruction in chemistry in the U. S. A., by H. S. van Klooster. An Irish-American chemist, William James MacNeven, 1763–1841, by D. Reilly. Was Newton an alchemist? by R. J. Forbes. Bemerkungen zu Hollandschen chemischen Forschern, by R. Winderlich. Découverte et Cémentation [illegible] et [illegible] la catalyse, by P. Lemay. History of [illegible] in India between about A. D. 700 and 1900, by P. K. Gode. Some personal qualities of Wilhelm Ostwald recalled by a former consultant, by E. F. Hiltpern. The experimental origin of chemical atomic and molecular theory before Boyle, by R. Hooykaas. Das chemische Laboratorium der Bayerischen Akademie der Wissenschaften in München, by W. Prandtl. Pehr's [illegible], by T. L. Davis. Some seventeenth century chemists and alchemists of Lorraine, by D. I. Duveen and A. Willemart. Sir Kenelm Digby alchemist, scholar, courtier and man of adventure, by W. Miles. Index of names. Errata corrigenda.

——Volume 3 Henry M. Leicester, editor in-chief. Philadelphia University of Pennsylvania Press 1950 250 p. illus. 24 cm. $4.50. 1082

Contents: Tenney Lombard Davis and the history of chemistry by H. M. Leicester and H. S. Klickstein. The beginnings of chemical instruction in America—a brief account of the teaching of chemistry at Harvard prior to 1800, by I. B. Cohen. Les appareils d'expérimentation de Lavoisier, by M. Daumas. Bioactive substances in the sixteenth century by R. Forbes. La quinina en las "Elementos de química" de Orfila, by C. X. Pellet and A. G. Velarde. Early American chemical societies. 1. The 1789 Chemical Society of Philadelphia. 2. The Chemical Society of Philadelphia, by W. Miles. The invention of printing and the diffusion of alchemical

CHEMISTRY

DICTIONARIES AND HANDBOOKS

BENNETT, HARRY, editor

Concise chemical and technical dictionary New York Tudor Publishing Company, Inc. 1947 1,055 p 23½ cm $10 00 1070

Note A wide range of subjects has been covered in this dictionary Although chemical terms predominate there are many terms from mathematics, physics, biology metallurgy metalworking, electronics, and a number of other fields. A selection of established trade names is also included. Altogether about 50,000 terms are defined. The definitions are brief the typical length being 10 to 15 words, but some run to 50 words or more. They are written for persons who ha e some familiarity with science and technology rather than for laymen. Another useful feature is the inclusion of a large umber of abbreviations and symbols.

CALLAHAM, LUDMILLA IGNATIEV

Russian English technical and chemical dictionary New York John Wiley & Sons, Inc., 1947 794 p illus 20 cm $16 50 1071

Note The scope f this dictionary is somewhat wider than the title indicates. Chemistry accounts for the largest number of terms, and engineering runs second but there are also many terms from such fields as mathematics, meteorology agriculture, botany and medicine. Also included are such words as legislator, manuscript, mandate, and steppe. The author justifies their inclusion on the ground that they are encountered in technical articles, but it ould appear that some of them could have been omitted. The total number f words included appears to be between 40,000 and 50,000. As the title indicates, the translation is from Russian to English, not English to Russian.

THE CONDENSED CHEMICAL DICTIONARY, a reference volume for all requiring quick access to essential data regarding chemicals and other substances used in manufacturing and research and to terms in general use in chemistry and the process industries Fifth edition completely revised and enlarged by Arthur and Elizabeth Rose. Formerly directed by Francis M Turner New York Reinhold Publishing Corporation 1956 1 200 p 23 cm $12 50 1072

Note The first edition of this standard reference book was published in 1919 the second edition in 1930, the third edition in 1942 the fourth edition in 1950. In the fifth edition the cyclopedic nature of the work is unchanged. The principal terms are not only defined, but considerable information not expected in dictionary is given about them. Most of the commercially important chemicals and trade-marked chemical products are concisely described as to general characteristics, chemical composition, properties, uses, hazards, shipping regulations, and standard commercial containers. Both common names such as "acetylene" and proprietary names such as "Econo-flour" are also included. Manufacturers' names are supplied for the chemicals sold under trade names. The book has been given ew format. The type is still set in two columns t the page but larger and more legible type has been used. The new page contains less matter hence the increase in pages is not true indication of additional contents. However many new terms, especially trade names, have been added also the information on hazards, shipping regulations, etc., have been revised where necessary for terms carried over from preceding editions.

HACKH, INGO WALDEMAR DAGOBERT

Hackh's Chemical dictionary (American and British usage) containing the words generally used in chemistry, and many of the terms used in the related sciences of physics, astrophysics, mineralogy, pharmacy, agriculture, biology, medicine, engineering etc. based on recent chemical literature. Third edition, completely revised and edited by Julius Grant. New York McGraw Hill Book Company, Inc., 1944 925 p illus. 25 cm. $9 50 1073

Note This work contains in one alphabetical sequence definitions and descriptions of the various terms, processes, and methods of chemistry Also included are descriptions of chemical apparatus and equipment, as well as brief biographies of important scientists. Graphical formulas for the hydrocarbons are given, together with many tables of other formulas and analytical data. In this edition pronunciation has been omitted, but otherwise the work has been thoroughly revised and the umber of terms expanded to over 57,000.

HANDBOOK OF CHEMISTRY AND PHYSICS, a ready reference book of chemical and physical data. Thirty-seventh edition. Editor-in chief Charles D Hodgman, associate editor in charge of chemistry, Robert C. Weast associate editor in charge of mathematics, Samuel M Selby Cleveland Chemical Rubber Publishing Company 1956 3 156 p. illus. 19 cm. $12 00 1074

Not An invaluable reference book used for many years in the scientific laboratories and libraries of the world. It is compendium of useful mathematical tables and formulas; data on physical and chemical constants; on chemical structures, solubilities and reactions basic information on biochemistry; the constants of radioactive elements and isotopes, etc. New editions are published frequently and there is always considerable revision and extension of the information included.

LANGE, NORBERT ADOLPH, compiler

Handbook of chemistry a reference volume for all requiring ready access to chemical and physical data used in laboratory work and manufacturing Compiled and edited by Norbert Adolph Lange assisted by Gordon M Forker Ninth edition. Sandusky Ohio Handbook Publishers, Inc. 1956 1,969 p. 20 cm $8.50 1075

Note. One of the standard American reference books for chemical laboratories and the offices of chemists and physicists. It contains data—much of it tabulated—on such topics as atomic weights and numbers, physical constants of the elements and compounds, flame temperatures, the composition of commercial metal alloys, the properties of materials of construction, and indices of refraction of various substances. The first edition was published in 1934 and the eighth edition in 1952. The changes in this ninth edition are described accurately and in detail in its preface. In short, they consist of correction of errors that have been discovered, revision

[illegible] The transition from the type theory to the valence theory. The periodic law. Bunsen, Berthelot, Pasteur and contemporaries. Organic chemistry since 1860. Index.

Note: A history of chemistry intended for the more mature student who is familiar with the important facts and principles of the science. The aim has been to emphasize only those facts and influences which have contributed to make the science what it is today; hence the chemical achievements of the ancients and the history of alchemy have been purposely compressed. Included in the text are biographical sketches of individual contributors, such as Paracelsus, Van Helmont, Cavendish, Dalton, and others. The third edition covers the advances from 1933 to 1939 with [illegible] of the work of living chemists and [illegible] of earlier achievements. New bibliographic material has also been added.

WEEKS MARY ELVIRA

Discovery of the elements. 6th edition. Edited, with a chapter on elements discovered by atomic bombardment, by Henry M. Leicester Illustrations collected by F B Dains. Easton, Pa. Journal of Chemical Education, 1956 910 p. illus. 24 cm. $10 00 1089

Contents: Elements known to the ancient world. Carbon and some of its compounds. Elements of the alchemists. More on the discovery of phosphorus. Some eighteenth-century metals. Old compounds of hydrogen and chlorine. Three important gases. Rutherford, discoverer of nitrogen. Chromium, molybdenum, tungsten, uranium. Contributions of the de Elhuyar brothers. Tellurium and selenium. Klaproth-Kitaibel letters on tellurium. Niobium (columbium) tantalum, vanadium. Contributions of Charles Hatchett. Contributions of Andrés Manuel del Río. The platinum metals. Some old potassium and sodium compounds. Three alkali metals. J. A. Arfwedson and his service to chemistry. Alkaline earth metals, magnesium, cadmium. Elements isolated with the aid of potassium and sodium. Other elements isolated with the aid of potassium and sodium. Some spectroscopic discoveries. Periodic system of the elements. Some elements predicted by Mendeleev. The rare earth elements. The halogen family. The inert gases. The natural radioactive elements. Discoveries by X-ray spectrum analysis. Elements discovered by atomic bombardment. List of the chemical elements. Chronology of element discovery. Index.

Note: A skillfully arranged history of the discovery of the chemical elements. The important steps in the research and discovery of each element is described. The narrative is highlighted with biographical information on scientists and illustrated with several hundred portraits, views of laboratories in which discoveries were made, reproductions of title pages, and other pictures. References to related literature are given. Compared with the previous edition (1945) the sixth edition has been very extensively written and expanded. It has been printed from new type, has many new illustrations and [illegible] more pleasing format.

MATHEMATICS FOR CHEMISTS

ANDERSON H. V

Chemical calculations Sixth edition. New York. McGraw Hill Book Company Inc., 1955 305 p. 24 cm. $4 75 1090

Contents: Measures and weights. Density. The language of chemistry. Gram-atoms and gram-moles. The measurement of temperature. Effects of changes in pressure and temperature on the volume of gases. Mole-weight—gas-volume relations. Derivation of chemical formulas. Chemical equations, metathetic type. Oxidation-reduction. Gram-equivalent weight. Molar and normal concentration. Principle of equivalency. Combination of gases. Thermochemical reactions. Electrochemistry. Chemical equilibrium, reversible reactions. Solubility-product principle. Appendix. Index.

Note: A long-established college textbook, the first edition of which was published in 1924 and the fifth edition in 1948. Editions preceding the sixth edition were by James S. Long and the present author. The main subject is the arithmetic and elementary algebra of chemistry, but related topics, such as chemical symbolism, are also discussed. In addition, there is more exposition of basic theory than might be expected in a book on chemical calculation. The supplementary text are numerous exercises for the student. In comparison to the fifth edition, the sixth edition has fewer pages, but essentially the same topics are covered and the arrangement is the same. Several chapters and sections of chapters have been rewritten, and the exercises and problems have been revised.

ARENSON SAUL BRYAN

Chemical arithmetic. Second edition. New York John Wiley & Sons, Inc., 1941 130 p. illus. 22 cm. $2.50 1091

Contents: Introduction. Units and their conversion factors. Atomic and molecular weights. Gas laws. Weight and volume relationship. Normal solution. Balancing equations. Graphical representation. Logarithm tables. Index.

Note: The aim of the book is to provide [illegible] clear explanation of all the common types of calculations of general chemistry and much of the field of quantitative analysis. An excellent treatment of the methods of graphical representation is given. Over [illegible] carefully selected problems afford intensive drill work in the application of principles. Stress is laid upon the application [illegible] common sense in the solution of problems rather than on the use of formulas. Answers are included to all problems; however only the first three digits are given, and the decimal point must be supplied.

ARENSON SAUL BRYAN

How to solve problems in quantitative analysis. New York Thomas Y Crowell Company 1942 89 p. 21 cm. $1.25 1092

Contents: Computations. Gravimetric analysis. Normal solutions in neutralization. Normal solutions in oxidation and reduction. Normal solutions in precipitation titrations. Appendix: Logarithms and antilogarithms.

Note: This text is designed for use in self-instruction by those who find difficulty with mathematical problems in quantitative analysis. For each type of calculation likely to be met, the author seeks to help the student, first to visualize the problem and then to plan his approach to its solution. After [illegible] preliminary discussion in each case, typical illustrative problems are presented and their solutions outlined in detail, together [illegible] the reasons for each step.

BABOR, JOSEPH ALBERT, AND GARRETT W THIESSEN

How to solve problems in physical chemistry New York Thomas Y Crowell Company 1944 215 p. 21 cm. $2.00 1093

Contents: Gases. Pure liquids. The solid state. Properties of analytical value (optical). Additive and constitutive properties. Solutions. Solutions of electrolytes. Colloids. Thermochemistry. Homogeneous equilibrium. Heterogeneous equilibrium. Chemical kinetics. Thermodynamics. Electrochemistry. International atomic weights (1941). Logarithms. Antilogarithms.

Note: This text is designed for use in self-instruction by those who find difficulty with mathematical problems in physical chemistry. For each type of calculation likely to be met, the authors seek to help the student first to visualize the problem and then to plan his approach to its solution. T[illegible] this end, after [illegible] preliminary discussion in each case, typical illustrative problems are presented and their solutions outlined in detail, together with the reasons for each step. Because the proper selection of the equivalents of factors (for example, the gas constant or the pressure) in the correct units usually helps the student to visualize the problem, the dimensional method is constantly stressed to stimulate logical thinking rather than blind substitution in [illegible] derived equations.

BABOR, JOSEPH ALBERT AND J KENNETH W MACALPINE

How to solve problems in qualitative analysis. New York Thomas Y Crowell Company 1943 93 p. 21 cm. $1.25 1094

Contents: Mathematical operations. Concentration of solutions. Weak electrolytes. Solubility-product principle. Ionization constant and solubility product. The water equilibrium: hydrolysis. Complex ions. Appendices: Ionization constants of weak acids and bases, solubility products, instability constants of complex ions [illegible] brief table of atomic weights; logarithms and antilogarithms.

Note: This text is designed for use in self-instruction by those who find difficulty with mathematical problems in qualitative analysis. For each type of calculation likely to be met, the authors first seek to help the student visualize the problem and then plan

and chemical knowledge, by R. Hirsch. Wandlungen in der geschichtlichen Betrachtung der Alchemie, by W Ganzenmüller Boyle and Bayle—the sceptical chemist and the sceptical historian, by G. Sarton. Karl Friedrich Mohr 1806–1879—"Father of volumetric analysis, by J M. Scott. Henri Sainte-Claire Deville, 1818–1881 by R. E. Oesper and P Lemay Bunsens Vorlesung über allgemeine Experimentalchemie, by H. Rheinboldt. The owl of Heinrich Khunrath—its origin and significance, by C. K. Deischer and J L. Rabinowitz.

—— Volume 4 Henry M Leicester, editor in-chief Philadelphia University of Pennsylvania Press, 1953 217 p illus 24 cm. $4 50 1083

Contents On the origin of alchemy by R. J. Forbes. Madame Lavoisier by D I. Duveen. Zukunftsaufgaben der Geschichte der Alchemie, by W Ganzenmüller Benjamin Rush, chemist, by W Miles. A projected by unpublished edition of the "Life and Works" f Robert Boyle, by C. F Bühler Auguste Laurent, founder of modern organic chemistry by C. de Milt. Zur Vorgeschicht des Meissner Porzellans, by W Prandtl. Charles Caldwell and the controversy in America over *Liebig's* Animal chemistry by H. S. Klickstein. Contributions of Maxwell Simpson (1815–1902) to aliphatic chemical synthesis, by D Reilly The scientific background of chemistry teachers in representative pharmacy schools of the United States during the 19th century by G. Sonnedecker Index of Names—Vols. 3 and 4 Errata corrigenda.

Note. Original, unpublished papers on aspects of the history of chemistry make up these yearly volumes. The typical paper is a scholarly contribution addressed to other scholars who are interested in the history of chemistry the history of science, or the history of the development f knowledge in general. It is documented with citations f the related literature, and may be illustrated with a portrait, reproduction of a title page, or other appropriate material.

FARBER, EDUARD

The evolution of chemistry, a history of its ideas, methods, and materials New York The Ronald Press Company, 1952, 349 p illus. 24 cm. $6 00 1084

Contents (abridged) Period I, The emergence of chemistry as a science *Survey f the period from the oldest records to the eighteenth century* From the fourth millennium B.C. to the third century A.D. From the third century to the sixteenth. From the beginning of the sixteenth century to the third quarter of the eighteenth. Phlogiston and dephlogisticated air Mines, pharmacies, and manufacturing plants. Period II, The development of chemical systems. Survey of the period from the late eighteenth century to the late nineteenth. Principles and elements. Galvanism and voltaism. Atoms and molecules. Foundations of organic chemistry The periodic system. The course of chemical change. Period III, Specialization and industrialization Survey of the period from the latter part f the nineteenth century to our own time M tter and radiation. Chemical bond and physical form. Inorganic chemistry Organic chemistry Biochemistry List f periodicals cited. Index of authors. Index f subjects.

Note. The whole of chemical history is covered in this rather short book. The author has necessarily used compressed style and has had to cover great developments in few lines. His pages are sprinkled with names, dates, and quotation marks consequently the book is not likely to attract many readers who are looking for an easily read narrative account. However since the main events are all mentioned together with references to source articles and longer accounts and the book is fully indexed, it is useful for elementary reference.

FARBER, EDUARD

Nobel prize winners in chemistry 1901–1950 New York Abelard-Schuman, Ltd 1953 219 p illus 22 cm $5 00 1085

Note A reference book containing short monographs on the 51 scientists who were awarded Nobel prizes in chemistry in the half-century 1901–1950. Each monograph is constructed on this pattern quotation of the citation used in awarding the prize, a short biographical sketch, quotation from the scientist's own writings describing the work for which the *prize was awarded*, and a short essay on the "consequences" of the discovery The description of the work is usually from the lecture delivered by the scientist on the occasion of accepting the prize. The whole is in English when the original lectures or articles from which these selections have been taken were in some other language, a translation has been made. Portraits of the included scientists are supplied on a photographic insert near the middle of the volume.

JAFFE, BERNARD

Crucibles the story of chemistry, from ancient alchemy to nuclear fission Revised edition New York Simon and Schuster, Inc., 1948 480 p. illus 21 cm $3 95 1086

Contents Bernard Trevisan (1406–1490) Theophrastus Paracelsus (1493–1541) John Joachim Becher (1635–1682) Joseph Priestley (1733–1804) Henry Cavendish (1731–1810) Antoine Laurent Lavoisier (1743–1794) John Dalton (1766–1844) John Jacob Berzelius (1779–1848) Amedeo Avogadro (1776–1856) Friedrich Woehler (1800–1882) Dmitri Ivanovitch Mendeléef (1834–1907) Svante Arrhenius (1859–1927) Marie Sklodowska Curie (1867–1934) Joseph John Thomson (1856–1940) Henry Gwyn Jeffreys Moseley (1887–1915) Irving Langmuir (1881) Ernest Orlando Lawrence (1901–) The men who harnessed nuclear fission. Nuclear energy tomorrow Sources and bibliography Index.

Note. A famous popular account of the growth of chemical knowledge. It is constructed on a framework of lives of great chemists, but it is not—as the chapter titles seem to indicate—a collection of short biographies. The whole panorama of developing knowledge is presented simply and dramatically without the use of mathematics or chemical notation. The first edition was published in 1930. In this edition three chapters have been added, and another has been revised. The bibliography has been revised.

LEICESTER, HENRY M

The historical background of chemistry New York John Wiley & Sons Inc., 1956 260 p. illus 24 cm $6 00 1087

Contents Introduction. Early practical chemistry Scientific ideas of the ancient world. Greek science. Hellenistic culture and the rise of alchemy Chinese alchemy Arabic alchemy The transmission f chemistry to the West. The fourteenth and fifteenth centuries. The sixteenth century a period of technical chemistry Chemical practice and theory in the first half of the seventeenth century The spread of atomistic theories. Theories of the eighteenth century—phlogiston and affinity Laboratory discoveries of the eighteenth century—the chemistry of gases. Lavoisier and the foundation of modern chemistry The laws of atomic combination. Electrochemistry and chemical affinity The development of organic chemistry—the radical and unitary theories. Organic chemistry from the theory of types to the structural theory The systematization of inorganic chemistry Physical chemistry in the nineteenth century The development of chemistry as a profession during the nineteenth century Radioactivity and atomic structure. Biochemistry Name Index. Subject Index.

Note By concentrating on the "development and interrelation of chemical concepts, the author of this book has produced brief, readable and informative history of chemistry Fully half of the space is devoted to the developments before the 18th century However in these pages the uthor corrects numerous misconceptions about the nature and significance of the ideas and work of the early natural philosophers and the later alchemists. Although accounts are included of 20th-century developments in such areas as radioactivity and biochemistry the twentieth century developments are not treated on the same scale as the treatments of earlier periods. Each of the chapters contains list of literature references, and the book is well indexed.

MOORE, FORRIS JEWETT

A history of chemistry Revision prepared by William T Hall Third edition. New York McGraw Hill Book Company, Inc., 1939 447 p. illus. 21 cm. (International chemical series, J F Norris consulting editor) $7.50 1088

Contents Chemistry among the ancients. Chemistry in the Middle Ages. Alchemy Chemistry in the Renaissance. Boyle and his contemporaries. The phlogiston theory The later phlogistonists. The discovery of oxygen Lavoisier Law of definite proportions. Dalton and the tomic theory The early history of galvanic electricity Humphry Davy Berzelius. The organizer of the science The beginning of organic chemistry The reaction against Berzelius. Gerhardt and the chemical reformation. Wil-

takes many more examples of solved problems than can be incorporated in the traditional texts, and most of the problems are more advanced than those in such texts. The book is of interest not only to students majoring in the field but also to chemistry graduates who wish refreshing in the handling of an unfamiliar variety of problems.

HITCHCOCK FRANK LAUREN, AND CLARK SHOVE ROBINSON

Differential equations in applied chemistry Second edition. New York John Wiley & Sons, Inc., 1936 120 p. illus. 19 cm. $3.50. 1102

Contents: Introduction. Processes of the first order. Processes of the second order. Simultaneous processes. Equations of flow. The numerical solution of differential equations. Miscellaneous problems. Index.

Note: The primary object of this pocket-size manual is to help students in chemistry and chemical engineering to think more readily in terms of calculus as a professional tool. It assumes a good general knowledge of differential and integral calculus on the part of the student and does not attempt to review in any way his previous mathematical studies, but rather to lead him into new fields of application in differential equations. The problems have been revised and expanded in the second edition, with added emphasis on the study of actual experiments.

SPICER, WILLIAM MONROE AND OTHERS

General chemistry problems, by William M. Spicer William S Taylor and Joe D Clary New York John Wiley & Sons, Inc., 1943 120 p. illus. 22 cm. $2.50. 1103

Contents: Introduction. Conversion of units, density, percentage. Equivalent weights. Percentage composition, molecular formula. The gas laws. Problems based on chemical equations. Valence. Molecular and atomic weights. Exponential numbers, logarithms, and the slide rule. Significant figures. Relative density, specific gravity. The use of chemical units of quantity. The concentration of solutions. Raoult's law. Equilibrium. Review problems. Index.

Note: For use as a supplementary text in general college chemistry. This book teaches the necessity for the justification of every step taken in the solution of a problem. It emphasizes the importance of thinking in terms of chemical units of quantity and describes the use of logarithms and the slide rule as applied to the solution of chemistry problems.

YOUDEN WILLIAM JOHN

Statistical methods for chemists New York John Wiley & Sons, Inc., 1951 126 p. 23 cm. $3.50 1104

Contents: Precision and accuracy. The measurement of precision. The comparison of averages. The statistics of errors. Statistics of the straight line. The analysis of variance. Interaction between factors. Requirements for data. Arrangements for improving precision. Experiments with several factors. List of publications referred to in the text. Appendixes: Critical values of *t*. Critical values of *F* at 5 per cent level. Critical values of *F* at 1 per cent level. Table of squares. Index.

Note: In this book both statistical theory and proofs are largely absent, and the text is confined to exposition of statistical techniques that will be useful to chemists in planning experiments and in interpreting data derived from experiments. Brevity has been achieved by limiting the scope rather than by compact treatment. Discussions of the points that are included are adequately full and include numerous worked examples. The author, who is associated with the National Bureau of Standards, is a recognized expert on statistical methods, in addition to being a noted research chemist.

GENERAL CHEMISTRY

BABOR, JOSEPH ALBERT AND ALEXANDER LEHRMAN

General college chemistry Third edition. New York Thomas Y Crowell Company 1951 800 p. illus. 24 cm. $6.00. 1105

Contents (abridged): The gaseous state. The atomic-molecular hypothesis. Energy changes in chemical reactions. Chemical equilibrium. Atomic structure, electron distribution, and valence. Hydrogen. Oxygen. Water and hydrogen peroxide. Water supply and health. The solid state. Solutions. Properties of solutions. Solutions of electrolytes. Ionization. The halogens. Oxidation-reduction. The sulfur family. Compounds of nitrogen. Other elements of the nitrogen family. Silicon. Colloid chemistry. Metals and metallurgy. Iron, cobalt, nickel, and the platinum metals. The alkali metals. The alkaline earth metals. Copper, silver and gold. Boron and aluminum. The electrochemical cell. Tin and lead. Nuclear chemistry. Appendices. Index.

Note: A standard introductory textbook which is specifically designed for students interested in chemistry or related sciences and who have completed a high school course in chemistry. The second edition appeared in 1940. This edition represents a substantial revision and a moderate expansion. Many of the chapter titles are the same, but the contents have been revised because new advances rendered the old text out of date. As would be expected, the discussion of radioactivity has been rewritten. Many equations are now written in ionic form, and many new illustrations have been substituted for old ones. The same authors have written *Introductory college chemistry*, second edition, New York Thomas Y. Crowell Co., 1950, 611 p. $4.00, for use by students who have had no previous introduction to chemistry.

BAILAR, JOHN C JR. editor

The chemistry of the coordination compounds. Edited by John C. Bailar Jr Daryle H. Busch, editorial assistant. New York Reinhold Publishing Corporation 1956. 834 p. illus. 23 cm. (American Chemical Society monograph series William A. Hamor editor) $18.50. 1106

Contents: A general survey of the coordination compounds, by J. C. Bailar, Jr. and D. H. Busch. The early development of the coordination theory, by J. C. Bailar Jr. Modern developments—the electrostatic theory of coordination compounds, by R. W. Parry and R. N. Keller. Modern developments—the electron pair bond and the structure of coordination compounds, by R. N. Keller and R. W. Parry. Chelation and the theory of heterocyclic ring formation involving metal ions, by R. W. Parry. Large rings, by T. D. O'Brien. General isomerism of complex compounds, by T. D. O'Brien. Stereoisomerism of hexacovalent atoms, by F. Basolo. Stereochemistry of coordination number four, by R. P. Block. Stereochemistry and occurrence of compounds involving the less common coordination numbers, by T. D. O'Brien. Stabilization of valence states through coordination, by J. V. Quagliano and R. L. Rebertus. Theories of acids, bases, amphoteric hydroxides and basic salts, as applied to the chemistry of complex compounds, by F. Basolo. Olation and related chemical processes, by C. L. Rollinson. The poly acids, by H. B. Jonassen and S. Kirschner. Coordination compounds of metal ions with olefins and olefin-like substances, by B. E. Douglas. Metal carbonyls and nitrosyls, by J. A. Mattern and S. J. Gill. Organic molecular compounds, by L. B. Clapp. Physical methods in coordination chemistry, by R. C. Brasted and W. E. Cooley. Coordination compounds in electrodeposition, by R. W. Parry and E. H. Lyons, Jr. The use of coordination compounds in analytical chemistry, by J. V. Quagliano and D. H. Wilkins. Coordination compounds in natural products, by G. L. Eichhorn. Dyes and pigments, by R. D. Johnson and N. C. Nielsen. Water softening through complex formation, by R. D. Johnson and C. F. Callis. Subject index.

Note: Generally speaking, the chemical compounds covered in this treatise are those produced by reactions between molecules possessing atoms or ions, which on the one hand can share by pairs of electrons, and molecules possessing atoms or ions which can furnish a pair of electrons. The metal chelates are included. As shown above, there are 23 signed chapters on theory, groups of compounds, and applications. Each of the chapters is in effect a literature survey and is extensively documented with references to the source articles. Most of the authors have covered their specific areas of the subject in considerable detail, especially in regard to such matters as the experimental evidence for particular structures and reaction mechanisms. The work is addressed to graduate chemists and will be used primarily as a reference book and guide to the literature. There is a very full subject index but no author index.

BRINKLEY STUART ROBERT

Introductory general chemistry Third edition. New York The Macmillan Company 1945 645 p. illus. 21 cm. $6.00 1107

his approach to its solution. To this end, after a preliminary discussion in each case typical illustrative problems are presented and their solutions outlined in detail, together with the reasons for each step.

BENNETT, CARL A , AND NORMAN L FRANKLIN

Statistical analysis in chemistry and the chemical industry Sponsored by the Committee on Applied Mathematical Statistics, The National Research Council. New York John Wiley & Sons, Inc., 1954 724 p illus 24 cm (Wiley publications in statistics, Walter A Shewhart, editor) $9 00 1095

Contents Introduction. Descriptive statistics. Probability and samples. Mathematical machinery Statistical inference. Relationships between variables. Analysis of variance. The design of experiments. Analysis of counted data. Control charts. Some tests for randomness. Bibliography Index.

Note The authors of this book are—in the order that their names appear above—Chief Statistician of the General Electric Company and Lecturer in Chemical Engineering in the University of Leeds, in short, an applied statistician and a specialist in chemical engineering. The book is addressed to applied chemists and chemical engineers, and its purpose is to make available to these groups statistical ideas and techniques applicable in their fields of activity Appropriately there is considerable emphasis on the basic methods of statistics. Numerous worked examples selected from problems in chemistry and chemical engineering are included, and there is also much stress on the selection of techniques to fit specific situations. A lengthy selected bibliography is included for the guidance of those readers who need more information or a more rigorous treatment of specific points.

BENSON, SIDNEY WILLIAM

Chemical calculations, an introduction to the use of mathematics in chemistry New York John Wiley & Sons, Inc , 1952 214 p 23 cm. $2 95 1096

Contents Measurement. Methods of measuring quantities of matter Chemical formulas. Chemical reactions. Energy and chemical changes. The properties of gases. The concept of combining power—valence. Measurement of solutions. The physical properties of solutions. Chemical equilibrium. Electrical properties of ionic solutions. Simple equilibria in ionic solutions. The ionization of water—hydrolysis. Additional equilibria in ionic solutions. Oxidation and reduction. Predicting redox reactions. Rates of chemical reactions. Appendixes. Index.

Note. A more comprehensive book than the typical introduction to this field. Basic methods of calculation and related chemical concepts and terminology are explained. Numerous examples in which equations are fully stated and are then solved step by step are included. The book is suitable not only for first-year college students, but also for those occasional readers who want to study the subject by themselves. The author is Professor of Chemistry at the University f Southern California.

CURTMAN, LOUIS JACOB, AND SYLVAN M EDMONDS

Calculations of qualitative analysis. New York The Macmillan Company, 1940 156 p illus. 24 cm. $3 90 1097

Content General properties of strong and weak electrolytes Chemical equations. Calculations based upon the chemical formula and equation. Solutions. Calculations involved in non-redox and redox reactions. Chemical equilibrium and ionization. Solubility product. The ionization of water—oxonium ion concentration. Complex ions. Theory of redox reactions. Appendix. Logarithm tables. Index.

Not This book provides material for use in conjunction with laboratory work in courses on qualitative analysis It tests the student's comprehension of theory gives him training in qualitative calculations, and prepares the way for his later work in quantitative analysis. All the calculations encountered in the theory and practice of qualitative analysis are covered. There is modern presentation of such topics as oxidation-reduction and salt effect, with problems. In addition to the list of problems for assignment on each topic, the underlying theory is outlined and its applications explained by appropriate examples. There is complete answer book available for teachers using the text.

ENGELDER, CARL JOHN

Calculations of qualitative analysis. Second edition. New York John Wiley & Sons, Inc., 1942 174 p 23 cm. $2 90 1098

Contents Mathematical operations. Stoichiometric calculations based on chemical equations. The preparation and use of reagents. Molar and gram-ion concentrations. Ionization equilibria. Solubility product equilibria. Complex-ion equilibria. Hydrolysis equilibria. Oxidation-reduction equilibria. General summary and review Appendix. Index.

Note This book is designed to give students practice in handling the calculations of qualitative analysis. The second edition provides the basic theory of equilibrium calculations as applied to ionic reactions. Fifteen sets of problems illustrate the theory In general, the problems in this edition are new Answers to the odd-numbered ones are given in the book. Numerous changes have been made in this edition.

ENGELDER, CARL JOHN

Calculations of quantitative analysis. New York John Wiley & Sons, Inc., 1939 174 p. 23 cm. $2 90 1099

Contents Introduction General considerations. The reagents of quantitative analysis. The calculations of volumetric analysis. The general calculations of volumetric analysis. The calculations of volumetric precipitation analysis. The calculations of neutralization analysis. The calculations of oxidation and reduction processes. The calculations of gravimetric analysis. General considerations of gravimetric analysis. Equilibria in gravimetric precipitation analysis. Calculations based on analytical data Systematic quantitative analysis. Computations based on percentage composition. Appendix. Index.

Note. A systematic sequence of problem assignments, in 15 sets, is presented in this book, each problem set consisting of 20 problems—a total of 300. Discussion of theory together with numerous illustrative examples, accompanies each problem set. The book applies the theory to typical analysis.

GORE, W L

Statistical methods for chemical experimentation. New York Interscience Publishers, Inc., 1952 210 p. illus 18 cm. $3 50 1100

Contents: Introduction. Statistical concepts. The reliability of estimates. Analysis of variance. Design of experiments. Correlation and regression. Attribute statistics. Appendixes. Tables. Index to formulas. Glossary Bibliography Subject index.

Note: A useful, relatively brief collection of the statistical methods most used in the design of chemical experiments at the Du Pont Experimental Station with which the author is associated. The style is direct and explicit. The book is well suited for the guidance of practical chemists who do not have time to master statistical theory Books which offer fuller treatments are listed in the annotated bibliography

GUGGENHEIM, E A , AND J E PRUE

Physiochemical calculations New York Interscience Publishers Inc., 1955 491 p illus. 24 cm $7.00 1101

Contents Atomic and molecular weights. Avogadro's number Molecular velocities. Interatomic distances. Moments of inertia Characteristic frequencies. Electric moments and polarizabilities. Energies and enthalpies. Entropies. Heat capacities. Equation of state. Mixtures of non-electrolytes. Electrolyte solutions. Conductance and diffusion of electrolytes. Gaseous equilibria. Solution equilibria. Acid-base equilibria. General electrolyt equilibria. Solid surfaces. Liquid surfaces. Gas kinetics. Solution kinetics. Radioactivity

Not The uthors of this book have worked out and arranged, according to the groups listed above 171 problems which illustrate the solving of typical problems in physical chemistry and chemical physics. The matter on each problem includes a statement on its object, listing of the pertinent experimental data with references to the source articles where they were published, an explanation of the steps taken in analyzing the problem, the mathematical calculations in full, and a supplementary discussion The book con-

take many more examples of solved problems than can be included in the traditional texts, and most of the problems are more advanced than those in such texts. The book is of interest not only to students majoring in the field but also to chemistry graduates who wish orientation in the handling of an unfamiliar variety of problems.

HITCHCOCK, FRANK LAUREN AND CLARK SHOVE ROBINSON

Differential equations in applied chemistry Second edition. New York John Wiley & Sons, Inc., 1936 120 p. illus. 19 cm. $3.50 1102

Contents: Introduction. Processes of the first order. Processes of the second order. Simultaneous processes. Equations of flow. The numerical solution of differential equations. Miscellaneous problems. Index.

Note: The primary object of this pocket-size manual is to help students in chemistry and chemical engineering to think more readily in terms of calculus as a professional tool. It assumes a good general knowledge of differential and integral calculus on the part of the student and does not attempt to review in any way his previous mathematical studies, but rather to lead him into new fields of application in differential equations. The problems have been revised and expanded in the second edition, with added emphasis on the study of actual experiments.

SPICER, WILLIAM MONROE, AND OTHERS

General chemistry problems, by William M. Spicer William S. Taylor and Joe D Clary New York John Wiley & Sons, Inc., 1943 120 p illus. 22 cm. $2.50 1103

Contents: Introduction. Conversion of units, density percentage. Equivalent weights. Percentage composition, molecular formulas. The gas laws. Problems based on chemical equations. Valence. Molecular and atomic weights. Exponential numbers, logarithms, and the slide rule. Significant figures. Relative density specific gravity. The use of chemical units of quantity. The concentration of solutions. Raoult's law. Equilibrium. Review problems. Index.

Note: For use as a supplementary text in general college chemistry. This book teaches the necessity for the justification of every step taken in the solution of problems. It emphasizes the importance of thinking in terms of chemical units of quantity and describes the use of logarithms and the slide rule as applied to the solution of chemistry problems.

YOUDEN WILLIAM JOHN

Statistical methods for chemists. New York John Wiley & Sons, Inc., 1951 126 p. 23 cm. $3.50. 1104

Contents: Precision and accuracy. The measurement of precision. The comparison of averages. The distribution of errors. Statistics of the straight line. The analysis of variance. Interaction between factors. Requirements for data. Arrangements for improving precision. Experiments with several factors. List of publications referred to in the text. Appendixes: Critical values of *t*. Critical values of *F* at 5 per cent level. Critical values of *F* at 1 per cent level. Table of squares. Index.

Note: In this book both statistical theory and proofs are largely absent, and the text is confined to expositions of statistical techniques that will be useful to chemists in planning experiments and in interpreting data derived from experiments. Brevity has been achieved by limiting the scope rather than by compact treatment. Discussions of the points that are included are adequately full and include numerous worked examples. The author, who is associated with the National Bureau of Standards, is a recognized expert on statistical methods, in addition to being a noted research chemist.

GENERAL CHEMISTRY

BABOR, JOSEPH ALBERT AND ALEXANDER LEHRMAN

General college chemistry Third edition. New York Thomas Y Crowell Company, 1951 800 p illus. 24 cm. $6.00 1105

Contents (abridged): The gaseous state. The atomic-molecular hypothesis. Energy changes in chemical reactions. Chemical equilibrium. Atomic structure, electron distribution, and valence. Hydrogen. Oxygen. Water and hydrogen peroxide. Water supply and health. The solid state. Solutions. Properties of solutions. Solutions of electrolytes. Ionization. The halogens. Oxidation reduction. The sulfur family. Compounds of nitrogen. Other elements of the nitrogen family. Silicon. Colloid chemistry. Metals and metallurgy. Iron, cobalt, nickel, and the platinum metals. The alkali metals. The alkaline earth metals. Copper, silver and gold. Boron and aluminum. The electrochemical cell. Tin and lead. Nuclear chemistry. Appendices. Index.

Note: A standard introductory textbook which is specifically designed for students interested in chemistry or related sciences and who have completed a high-school course in chemistry. The second edition appeared in 1940. This edition represents a substantial revision and a moderate expansion. Many of the chapter titles are the same, but the contents have been revised, because new advances rendered the old text out of date. As would be expected, the discussion of radioactivity has been rewritten. Many equations are now written in ionic form, and many new illustrations have been substituted for old ones. The same authors have written Introductory college chemistry, second edition, New York, Thomas Y. Crowell Co., 1950, 517 p. $4.00, for use by students who have had no previous introduction to chemistry.

BAILAR, JOHN C JR., editor

The chemistry of the coordination compounds. Edited by John C. Bailar Jr Daryle H. Busch editorial assistant. New York Reinhold Publishing Corporation, 1956 834 p. illus. 23 cm. (American Chemical Society monograph series William A Hamor editor) $18.50 1106

Contents: A general survey of the coordination compounds, by J. C. Bailar Jr. and D. H. Busch. The early development of the coordination theory, by J. C. Bailar Jr. Modern developments—the electrostatic theory of coordination compounds, by R. W. Parry and R. N. Keller. Modern developments—the electron pair bond and the structure of coordination compounds, by R. N. Keller and R. W. Parry. Chelation and the theory of heterocyclic ring formation involving metal ions, by R. W. Parry. Large rings, by T. D. O'Brien. General behavior of complex compounds, by T. D. O'Brien. Stereoisomerism of hexacovalent atoms, by F. Basolo. Stereochemistry of coordination number four, by R. F. Block. Stereochemistry and occurrence of compounds involving the less common coordination numbers, by T. D. O'Brien. Stabilization of valence states through coordination, by J. V. Quagliano and R. L. Rebertus. Theories of acids, bases, amphoteric hydroxides and basic salts, as applied to the chemistry of complex compounds, by F. Basolo. Chelation and related chemical processes, by C. L. Rollinson. The poly acids, by H. B. Jonassen and S. Kirschner. Coordination compounds of metal ions with olefins and olefin-like substances, by B. E. Douglas. Metal carbonyls and nitrosyls, by J. A. Mattern and J. S. Gill. Organic molecular compounds, by L. E. Clapp. Physical methods in coordination chemistry, by R. C. Brasted and W. E. Cooley. Coordination compounds in electrodeposition, by R. Dyes and pigments, by R. D. Johnson and N. C. Nielsen. Water softening through complex formation, by R. D. Johnson and C. F. Coffin. Subject index.

Note: Generally speaking, the chemical compounds covered in this treatise are those produced by reactions between molecules possessing atoms or ions which on the one hand can share a pair of electrons, and molecules possessing atoms or ions which can furnish a pair of electrons. The metal chelates are included. As shown above, there are 23 signed chapters on theory, groups of compounds, and applications. Each of the chapters is in effect a literature survey and is extensively documented with references to the source articles. Most of the authors have covered their specific areas of the subject in considerable detail, especially in regard to such matters as the experimental evidence for particular structures and reaction mechanisms. The work is addressed to graduate chemists and will be used primarily as a reference book and guide to the literature. There is a very full subject index but no author index.

BRINKLEY STUART ROBERT

Introductory general chemistry Third edition. New York The Macmillan Company 1945 645 p. illus. 21 cm. $6.00. 1107

Contents (abridged) Changes in substances—the atomic theory Oxygen the atmosphere. States of matter—the kinetic theory Solutions. Chemical equilibrium. Determination of molecular and atomic weights. The alkali metals and hydroxides. The halogens and hydrohalic acids. The periodic system. Atomic structures. Ionization. Acids, bases, ampholytes, hydrolysis. Analytical separations of metal ions. Oxidation-reduction in solution. Sulfur sulfuric acid. Nitrogen, ammonia, nitric acid. The phosphorus family of elements. The colloidal state of dispersion. The metallic elements. The alkaline earth metals. Hydrocarbons. Derivatives of the hydrocarbons. Problems. Appendix. Index.

Note The most important changes in the third edition of this standard textbook are the new order in which the topics are presented, and the re-defining of acidity-basicity concepts in terms of the proton donor-acceptor theory The Brönsted definitions are now used throughout the book, thus simplifying the discussions. The book is intended for college students who are beginning the study of chemistry

BRINKLEY, STUART ROBERT

Principles of general chemistry Fourth edition New York The Macmillan Company, 1951 703 p illus 24 cm. $6 50 1108

Contents (abridged) Substances and changes they undergo. Typical reactions. Equations and calculations. Atomic structures. Chemical equilibrium. Solutions. The colloidal state Completed ionic reactions. Hydrolysis. The hydroacids. The oxides and hydroxides of the metals. Oxidation-reduction. Nitrogen. Sulfur The phosphorus family The elements of group IV The production of metals from ores. The transition elements. Salts. Compounds of chromium and manganese. Electric cells. The nucleus of the atom. Liquid and gaseous fuels. Derivatives of the hydrocarbons. Appendix. Index.

Not An outstanding introductory college textbook. It is particularly suited to students who have studied the subject in high school and intend to pursue it beyond the first college course. N major changes have been made in comparison to the preceding edition. However throughout the book, there are rewritten paragraphs, new exercises, and revised lists of supplementary reading. New development have caused such changes as the following "Fluorine has few uses of importance (third edition) to "Fluorine and its compounds are becoming increasingly important (fourth edition)

BRISCOE, HERMAN THOMPSON

General chemistry for colleges Fourth edition Boston Houghton Mifflin Company, 1949 773 p illus 25 cm $6 50 1109

Contents (abridged) Matter and energy Kinds of substances and their chemical changes. Structures of atoms and molecules. Oxidation and combustion. The gas laws and the kinetic molecular theory Hydrogen. Molecules and molecular weights. Atomic weights and combining capacity Solutions. X-ray spectra, atomic numbers, and the structures of crystals. Radioactivity The structure of matter The oxides and other simple compounds of carbon. The atmosphere. The halogens. Oxidation and reduction. The alkali metals. Solutions of electrolytes. Chemical equilibrium. Nitrogen and ammonia. The sulfur family Silicon and related elements. Colloidal dispersions. Organic chemistry—the hydrocarbons. Carbohydrates and proteins—food and nutrition. Energy in chemical change. The metals. Appendix. Index.

Note A standard introductory textbook. It contains more material than some texts written at the same level and, although applications are mentioned and shown in illustrations, the main emphasis is on fundamental matters. The author's style is easy to read, and the publisher has given the book an attractive format. The third edition was published in 1945 The more prominent changes in the text of this edition relate to nuclear chemistry atomic energy and radioactivity However numerous changes have been made in the treatment of other topics. The type of the book has been re-set and there are now two columns of print to page.

CARNEY THOMAS PATRICK

Laboratory fractional distillation New York The Macmillan Company 1949 259 p illus 24 cm $6 50 1110

Contents Theory Mathematical treatment. Column characteristics. Theoretical plates and reflux ratio required for given separation. Separation to be expected. Selection of proper columns. Bubble plate columns. Unpacked columns. Packed columns. Miscellaneous packing. Rotary distillation columns. Effect of variables on column characteristics. Operation of the column. Vacuum fractionation. Construction of columns. Testing the column. Accessory equipment. Special columns. Vapor-liquid equilibrium determination. Azeotropic and extractive distillation. Micro and semimicro fractionation. Molecular distillation. General bibliography Index.

Note Graduate chemists, laboratory technicians, and advanced students find this volume valuable and practical guide to the methods and techniques of fractional distillation. Fundamental principles are discussed, but the construction and operation of laboratory distillation apparatus and especially the packing and construction of columns are emphasized. Information is provided regarding ease of operation, costs, comparative efficiency etc., of various types of apparatus. Line drawings and diagrams are used freely and 23-page classified bibliography is included.

CHAMOT, EMILE MONNIN, AND CLYDE WALTER MASON

Handbook of chemical microscopy Second edition New York John Wiley & Sons, Inc., 1938–40 2 v illus 23 cm $8 75 per vol. 1111

Contents (abridged) Volume I Principles and uses of microscopes and accessories. The optical system of the microscope. Microscopes for use in chemical laboratories. Illumination of transparent objectives. Illumination of opaque objects. Methods for the preparation of materials for microscopical study Special methods for interpretation of appearances and observation of physical properties. Ultramicroscopy Photomicrography and microprojection The study of doubly refracting materials by means of the polarizing microscope. Chemical crystallography Determination of refractive indices of liquids and solids. Microscopical measurements. Particle size determination. Quantitative analyses of heterogeneous mixtures. Appendix. Index. Volume II Chemical methods and inorganic qualitative analysis. Manipulative methods of a general character. Methods of applying reagents in microscopical qualitative analysis. Detection of the elements of Group I of the periodic system. Detection of the elements of Group II, III, IV V, VI, VII, VIII. Detection of the rare earths. The detection of anions. Special reagents yielding reactions with a number of cations. Qualitative analysis of material of unknown composition. Appendix. Index.

Note Although first published in 1930 and published in second edition as noted above and not since revised, this standard work is still useful for instruction and reference on (1) the microscope as an instrument in chemical and mineralogical laboratories, and (2) the identification or qualitative analysis of very small samples of inorganic substances. Volume I contains full or explicit discussions of the principles and elements of the microscope and of the accessories useful in chemical laboratory work. It describes also the general techniques of preparing materials for microscopic examination. Volume II contains explicit directions for the microscopic analysis of inorganic materials, and is illustrated with over 200 reproductions of excellent microphotographs showing the appearance of various substances under the microscope at stated magnifications.

CHAPIN WILLIAM HENRY

Second year college chemistry Fifth edition, revised by Luke E Steiner New York John Wiley & Sons Inc. 1943 575 p. illus. 22 cm $6 75 1112

Contents The structure of matter The gas laws. Liquids and their relation with gases. Solids and their relations with gases and liquids. The quantitative laws of chemical combination Atoms and molecules and their weights. Formulas and equations and chemical calculations. Valence and the chemical bond. The periodic system. Rays from vacuum tubes Radioactivity Atomic structure and valence. Atomic transmutations. Solutions and solubility Laws of solutions. Solvent properties. Acids, bases, and salts. Homogeneous equilibrium. Neutralization indicators and acid-alkali titrations. Heterogeneous equilibrium. Colloids. Electrochemistry Appendix. Index.

Not A basic textbook for second-year inorganic chemistry course It serves as guide for review of and an expansion of, general principles. Liquids and solutions are discussed more fully and exactly in the fifth edition, and there is new chapter on crystalline solids which serves as an introduction to structural chemistry

DEMING HORACE GROVE

Fundamental chemistry an elementary textbook for college classes. Second edition. New York John Wiley & Sons, Inc., 1947 745 p. illus. 22 cm. $6.00 1113

Contents: The changing universe. Elements and compounds. Atoms and molecules. Weights and formulas. Oxygen. Energy. Hydrogen. The properties of gases. Molar and molal properties. Liquids. Solids. Changes of state. Properties of acids—valence. How ions are formed. Properties of acids. Chlorine. The periodic table. Within the atom. Building molecules. Oxidation and reduction. The halogens. Solutions. The sulfur family. Reaction rate. Chemical equilibrium. The atmosphere. Nitrogen. The relatives of nitrogen. Hydroxyl—hydrogen ion concentration. Precipitation. The colloidal state of matter. Carbon. Organic chemistry. Some [illegible] syntheses. Silicon and boron. The metals. Electrochemistry. The light metals. The transition metals. Iron and steel. The post-transition metals. Nuclear chemistry. Chemistry and the spirit of science. Appendices. Index.

Note: The author, one of the most successful American writers of chemical textbooks, has incorporated in this one several novel features of content and organization. The book is designed for courses offered to students who plan to take additional work in the subject. It deals less with industrial applications of chemistry than does his *General chemistry*, fifth edition, New York, 1944, and differs from his *Introductory college chemistry*, second edition, New York, 1942, by placing more emphasis on principles and less on historical details. Changes made in the present edition include some rewriting and rearranging and the addition of material on new developments, such as silico-organic compounds, antibiotics, and nuclear chemistry.

DEMING HORACE GROVE

General chemistry an elementary survey emphasizing industrial applications of fundamental principles. Sixth edition. New York John Wiley & Sons Inc., 1952 656 p. illus. 24 cm. $6.50. 1114

Contents (abridged): The beginnings of chemistry. Mixtures and substances. Atoms and molecules. Energy. The properties of gases. Liquids and solids. Solutions. Electrons and valence. Acids. Neutralization and hydrolysis. The colloidal state of matter. Chemical equilibrium. Oxidation and reduction. Nuclear chemistry. The hydrocarbons. Cellulose products, plastics. Elastomers, dyestuffs, medicinals. Industries based on sulfur and salt. The ceramic industries. Iron and steel. Electrochemistry. The transition metals. Index.

Note: A long established—the first edition was published in 1923—introductory textbook for use in college courses. One of its chief characteristics is the purposeful relating of the theoretical material to practical applications, a feature intended to stimulate the interest of engineering students. Many changes in both text and illustrations were made in preparing the present edition. Most of the new material relates, as might be expected, to developments pertaining to atomic structure and to new industrial processes and products.

EHRET WILLIAM FREDERICK

Smith's college chemistry Sixth edition. New York Appleton-Century-Crofts, Inc., 1946 677 p. illus. 26 cm. $5.50 1115

Contents (abridged): The chemical view of matter. Chemical change and some methods of studying it. The atomic theory. Symbols, formulas, and equations. The velocity of chemical reactions. The measurement of gases. Solutions. The periodic classification of the elements. Radioactivity and the transmutation of elements. Atomic number, atomic nuclei, and isotopes. Atomic structure and valence. Energy and chemical change. Chemical equilibrium. Solutions of electrolytes. Newer concepts of acids and bases. Oxidation and reduction. The atmosphere and its inert components. The hydrocarbons and their simple derivatives. Plant life and products. Animal life and animal products. Synthetic organic products. Colloidal suspensions. The metallic elements. Electromotive chemistry and voltaic cells. Appendix. Index.

Note: A classic chemistry text, the various editions of which have been used in colleges of the United States of America for over 30 years. The original author was Alexander Smith, 1865–1922. The third, fourth, and fifth editions were the work of James Kendall. In his sixth edition, the work was very extensively revised by Professor Ehret of New York University. Large sections of the expository text were rewritten, many new illustrations added, and the problems and lists of references were revised. However, the book remains a broad introduction to chemical chemistry in which many of the topics are covered descriptively.

EHRET, WILLIAM FREDERICK

Smith's Introductory college chemistry Third edition. New York Appleton-Century Crofts Inc. 1950 511 p. illus. 25 cm $5.00 1116

Contents (abridged): Elements and compounds. The laws of chemical combination. Atoms and their properties. The properties of gases. Water and hydrogen peroxide. Solutions. Salt and sodium hydroxide. The solid state. The halogens. The transmutation of elements. The nuclei of atoms. Electronic structure and chemical properties. Chemical equilibrium. The properties of electrolytes. Acid-base systems. Oxidation and reduction. Oxygen compounds of the halogens. Sulfur and sulfides. Compounds of nitrogen. Phosphorus and its compounds. Carbon. Plant life and products. Animal life and products. Synthetic organic products. Silicon and boron. Metals and metallurgy. Electrochemistry. Appendix. Index.

Note: A shorter book, based on the author's *Smith's college chemistry* described above. It has the same lineage and the revision came on the preceding edition by James Kendall. It is less encyclopedic than the larger text but covers the fundamental concepts and the laws of general chemistry and also a considerable range of facts on the properties of the individual elements and their compounds. In comparison to the preceding edition, revisions were made in both the text and illustrations, and many new illustrations were introduced. Also, the terminology was modified to bring the nomenclature in line with the recommendations of the International Union of Chemistry published in the *Journal of the American Chemical Society*, volume 63, page 889. As in preceding editions, terms are carefully defined when first introduced, and little mathematics is used.

FELSING WILLIAM AUGUST, AND GEORGE W WATT

General chemistry Third edition New York McGraw Hill Book Company Inc., 1951 558 p. illus. 24 cm. $6.00. 1117

Contents (abridged): Forms of matter. Weight relationships. The structure of atoms. Properties of gases. Relative weights of molecules. Solutions. Acids, bases, and salts, nomenclature. Ionization. Ion equilibria. Classification of the elements. Colloids. Electrolysis. Industrial electrochemical processes. Battery cells. Metals and alloys. Heavy metals. Some binary compounds of nonmetallic elements. Commercial production of acids and bases. Nuclear chemistry. Organic chemistry. Appendix. Answers to problems. Index.

Note: An introduction to the fundamentals of chemistry for first-year college students. The chief differences between this and the previous edition are greater emphasis on quantitative methods and rearrangement in the order of subject presentation. Thus, atomic structure is now discussed in the fourth instead of the fourteenth chapter, and nuclear chemistry is deferred until the final chapters. The subject of chemical equilibria is treated in greater detail, and the number and variety of review problems have been increased. Answers to numerical problems are included.

GLASSTONE SAMUEL

Theoretical chemistry, an introduction to quantum mechanics statistical mechanics and molecular spectra for chemists. Princeton D Van Nostrand Company Inc., 1944 515 p illus. 23 cm. $7.00 1118

Contents: Introduction; quantum numbers. Quantum mechanics. Quantum theory of valence. Molecular spectra. diatomic molecules. Molecular spectra. Polyatomic molecules. The electronic configuration of diatomic molecules. Statistical mechanics. Statistical thermodynamics. Intermolecular forces. Index.

Note: An elementary knowledge of calculus, including differential equations, is a prerequisite for this advanced text for graduate chemists. Dissociation accompanying light absorption, valence force constants, and bond distances are a few of the topics discussed. Supplemental references are provided in the preface and as footnotes.

Contents (abridged) Changes in substances—the atomic theory Oxygen the atmosphere. States of matter—the kinetic theory Solutions. Chemical equilibrium. Determination of molecular and atomic weights. The alkali metals and hydroxides. The halogens and hydrohalic acids. The periodic system. Atomic structure. Ionization. Acids, bases, ampholytes, hydrolysis. Analytical separations of metal ions. Oxidation-reduction in solution. Sulfur sulfuric acid. Nitrogen, ammonia, nitric acid. The phosphorus family of elements. The colloidal state of dispersion. The metallic elements. The alkaline earth metals. Hydrocarbons. Derivatives of the hydrocarbons. Problems. Appendix. Index.

Note. The most important changes in the third edition of this standard textbook are the new order in which the topics are presented, and the re-defining of acidity-basicity concepts in terms of the proton donor-acceptor theory The Brönsted definitions are now used throughout the book thus simplifying the discussions. The book is intended for college students who are beginning the study of chemistry

BRINKLEY, STUART ROBERT

Principles of general chemistry Fourth edition. New York The Macmillan Company, 1951 703 p illus 24 cm $6 50 1108

Contents (abridged) Substances and changes they undergo. Typical reactions. Equations and calculations. Atomic structure. Chemical equilibrium. Solutions. The colloidal state. Completed ionic reactions. Hydrolysis. The hydroacids. The oxides and hydroxides of the metals. Oxidation-reduction. Nitrogen. Sulfur The phosphorus family The elements of group IV The production of metals from ores. The transition elements. Salts. Compounds of chromium and manganese. Electric cells. The nucleus of the atom. Liquid and gaseous fuels. Derivatives of the hydrocarbons. Appendix. Index.

Note. An outstanding introductory college textbook. It is particularly suited to students who have studied the subject in high school and intend to pursue it beyond the first college course. No major changes have been made in comparison to the preceding edition. However throughout the book, there are rewritten paragraphs, new exercises, and revised lists of supplementary reading. New developments have caused such changes as the following "Fluorine has few uses of importance (third edition) to "Fluorine and its compounds are becoming increasingly important (fourth edition)

BRISCOE, HERMAN THOMPSON

General chemistry *for colleges* Fourth edition Boston Houghton Mifflin Company, 1949 773 p illus 25 cm $6 50 1109

Contents (abridged) Matter and energy Kinds of substances and their chemical changes. Structures of atoms and molecules. Oxidation and combustion. The gas laws and the kinetic molecular theory Hydrogen. Molecules and molecular weights. Atomic weights and combining capacity Solutions. X-ray spectra, atomic numbers, and the structures of crystals. Radioactivity The structure of matter The oxides and other simple compounds of carbon. The atmosphere. The halogens. Oxidation and reduction. The alkali metals. Solutions of electrolytes. Chemical equilibrium. Nitrogen and ammonia. The sulfur family Silicon and related elements. Colloidal dispersions. Organic chemistry—the hydrocarbons. Carbohydrates and proteins—food and nutrition. Energy in chemical change. The metals. Appendix. Index.

Note A standard introductory textbook. It contains more material than some texts written at the same level; and, although applications are mentioned and shown in illustrations, the main emphasis is on fundamental matters. The author's style is easy to read, and the publisher has given the book an attractive format. The third edition was published in 1943 The more prominent changes in the text of this edition relate to nuclear chemistry atomic energy and radioactivity However numerous changes have been made in the treatment of other topics. The type of the book has been re-set and there are now two columns of print to a page.

CARNEY, THOMAS PATRICK

Laboratory fractional distillation New York The Macmillan Company 1949 259 p illus 24 cm $6 50 1110

Contents Theory Mathematical treatment. Column characteristics. Theoretical plates and reflux ratio required for given separation. Separation to be expected. Selection of proper columns. Bubble plate columns. Unpacked columns. Packed columns. Miscellaneous packing. Rotary distillation columns. Effect of variables on column characteristics. Operation of the column. Vacuum fractionation Construction of columns. Testing the column. Accessory equipment. Special columns. Vapor-liquid equilibrium determination. Azeotropic and extractive distillation. Micro and semimicro fractionation. Molecular distillation. General bibliography Index.

Note Graduate chemists, laboratory technicians, and advanced students find this volume a valuable and practical guide to the methods and techniques of fractional distillation. Fundamental principles are discussed, but the construction and operation of laboratory distillation apparatus and especially the packing and construction of columns are emphasized. Information is provided regarding ease of operation, costs, comparative efficiency etc., of various types of apparatus. Line drawings and diagrams are used freely and 32-page classified bibliography is included.

CHAMOT, EMILE MONNIN, AND CLYDE WALTER MASON

Handbook of chemical microscopy Second edition New York John Wiley & Sons, Inc., 1938–40 2 v illus 23 cm $8 75 per vol. 1111

Contents (abridged) Volume I Principles and uses of microscopes and accessories. The optical system of the microscope. Microscopes for use in chemical laboratories. Illumination of transparent objectives. Illumination of opaque objects. Methods for the preparation of materials for microscopial study Special methods for interpretation of appearances and observation of physical properties. Ultramicroscopy Photomicrography and microprojection. The study of doubly refracting materials by means of the polarizing microscope. Chemical crystallography Determination of refractive indices of liquids and solids. Microscopial measurements. Particle size determination. Quantitative analyses of heterogeneous mixtures. Appendix. Index. Volume II Chemical methods and inorganic qualitative analysis. Manipulation, methods of a general character Methods of applying reagents in microscopial qualitative analysis. Detection of the elements of Group I of the periodic system. Detection of the elements of Group II, III, IV V VI, VII, VIII. Detection of the rare earths. The detection of anions. Special reagents yielding reactions with a number of cations. Qualitative analysis of material of unknown composition. Appendix. Index.

Note Although first published in 1930, and published in second edition as noted above and not since revised, this standard work is still useful for instruction and reference on (1) the microscope as an instrument in chemical and mineralogical laboratories, and (2) the identification or qualitative analysis of very small samples of inorganic substances. Volume I contains full or explicit discussions of the principles and elements of the microscope and of the accessories useful in chemical laboratory work. It describes also the general techniques of preparing materials for microscopic examination. Volume II contains explicit directions for the microscopic analysis of inorganic materials, and is illustrated with over 200 reproductions of excellent microphotographs showing the appearance of various substances under the microscope at stated magnifications.

CHAPIN WILLIAM HENRY

Second year college chemistry Fifth edition, revised by Luke E Steiner New York John Wiley & Sons Inc. 1943 575 p illus. 22 cm $6 75 1112

Contents The structure of matter The gas laws. Liquids and their relation with gases. Solids and their relations with gases and liquids. The quantitative laws of chemical combination. Atoms and molecules and their weights. Formulas and equations and chemical calculations. Valence and the chemical bond. The periodic system Rays from vacuum tubes. Radioactivity Atomic structure and valence. Atomic transmutations Solutions and solubility Laws of solutions. Solvent properties. Acids, bases, and salts. Homogeneous equilibrium. Neutralization indicators and acid-alkali titrations. Heterogeneous equilibrium Colloids Electrochemistry Appendix. Index.

Note A basic textbook for second-year inorganic chemistry course. It serves as guide for a review of and an expansion of general principles. Liquids and solutions are discussed more fully and exactly in the fifth edition, and there is new chapter on crystalline solids which serves as an introduction to structural chemistry

General Chemistry

DEMING, HORACE GROVE

Fundamental chemistry an elementary textbook for college classes. Second edition. New York John Wiley & Sons, Inc., 1947 745 p. illus 22 cm. $6.00 1113

Contents: This changing universe. Elements and compounds. Atoms and molecules. Weights and formulas. Oxygen. Energy. Hydrogen and [illegible]. The properties of gases. Mass and weight properties. Liquids. [illegible]. Changes of state. Properties of [illegible]. How ions are formed. Properties of acids. Chlorine. The periodic table. Within the atom. Building molecules. Oxidation and reduction. The halogens. Solutions. The sulfur family. Reaction rates. Chemical equilibrium. The atmosphere. Nitrogen. The relatives of nitrogen. Hydrolysis—hydrogen ion concentration. Precipitation. The colloidal state of matter. Carbon. Organic chemistry. Some famous syntheses. Silicon and boron. The metals. Electrochemistry. The light metals. The transition metals. Iron and steel. The post-transition metals. Nuclear chemistry. Chemistry and the [illegible] of [illegible]. Appendixes. Index.

Note: The author, one of the most successful American writers of chemical textbooks, has incorporated in this one several novel features of content and organization. The book is designed for courses offered to students who plan to take additional work in the subject. It deals less with industrial applications of chemistry than does his *General chemistry*, fifth edition, New York, 1944, and differs from his *Introductory college chemistry*, second edition, New York, 1942, by placing more emphasis on principles and less on historical details. Changes made in the present edition include some rewriting and rearrangement and the addition of material on new developments, such as silico-organic compounds, antibiotics, and nuclear chemistry.

DEMING HORACE GROVE

General chemistry an elementary survey emphasizing industrial applications of fundamental principles. Sixth edition. New York John Wiley & Sons Inc., 1952 656 p. illus. 24 cm. $6.50 1114

Contents (abridged): The beginnings of chemistry. Mixtures and substances. Atoms and molecules. Energy. The properties of gases. Liquids and solids. Solutions. Electrons and valence. Acids. Neutralization and hydrolysis. The colloidal state of matter. Chemical equilibrium. Oxidation and reduction. Nuclear chemistry. The hydrocarbons. Cellulose products, plastics. Elastomers, dyestuffs, medicinals. Industries based on sulfur and salt. The ceramic industries. Iron and steel. Electrochemistry. The transition metals. Index.

Note: A long established—the first edition was published in 1923—introductory textbook for use in college courses. One of its chief characteristics is the purposeful relating of the theoretical material to practical applications. [illegible] features intended to stimulate the interest of engineering students. Many changes in both text and illustrations were made in preparing the present edition. Most of the new material relates, as might be expected, to developments pertaining to atomic structure and to new industrial processes and products.

EHRET WILLIAM FREDERICK

Smith's college chemistry Sixth edition. New York Appleton-Century-Crofts, Inc., 1946 677 p. illus. 26 cm. $5.50 1115

Contents (abridged): The chemical view of matter. Chemical change and some methods of studying it. The atomic theory. Symbols, formulas, and equations. The velocity of chemical reactions. The measurement of gases. Solutions. The periodic classification of the elements. Radioactivity and the transmutation of elements. Atomic number, atomic nuclei, and isotopes. Atomic structure and valence. Energy and chemical change. Chemical equilibrium. Solutions of electrolytes. Newer concepts of acids and bases. Oxidation and reduction. The atmosphere and its inert components. The hydrocarbons and their simple derivatives. Plant life and products. Animal life and natural products. Synthetic organic products. Colloidal suspensions. The metallic elements. Electromotive chemistry and voltaic cells. Appendix. Index.

Note: A classic chemistry text, the various editions of which have been used in colleges of the United States of America for over 30 years. The original author was Alexander Smith, 1865–1922. The third, fourth, and fifth editions were the work of James Kendall. In the sixth edition, the work was very extensively revised by Professor Ehret of New York University. Large sections of the [illegible] were rewritten, many new illustrations added, and the problems and lists of references were revised. However the book remains a broad introduction to chemical chemistry in which many of the topics are covered descriptively.

EHRET WILLIAM FREDERICK

Smith's Introductory college chemistry Third edition. New York Appleton-Century Crofts, Inc., 1950 511 p. illus 25 cm. $5.00 1116

Contents (abridged): Elements and compounds. The laws of chemical combination. Atoms and their properties. The properties of gases. Water and hydrogen peroxide. Solutions. Salt and sodium hydroxide. The solid state. The halogens. The transmutation of elements. The [illegible] of atoms. Electronic structure and chemical properties. Chemical equilibrium. The properties of electrolytes. Acid-base systems. Oxidation and reduction. Oxygen compounds of the halogens. Sulfur and sulfides. Compounds of nitrogen. Phosphorus and its compounds. Carbon. Plant life and products. Animal life and products. Synthetic organic products. Silicon and boron. Metals and metallurgy. Electrochemistry. Appendix. Index.

Note: A shorter book, based on the author's *Smith's college chemistry* described above. It has the same format and the reviser's name on the preceding edition is James Kendall. It is less cyclopedic than the larger text but covers the fundamental concepts and the laws of general chemistry and also a considerable range of facts on the properties of the individual elements and their compounds. In comparison to the preceding edition, revisions were made in both the text and illustrations, and many new illustrations were introduced. Also, the terminology was modified to bring the nomenclature in line with the recommendations of the International Union of Chemistry published in the *Journal of the American Chemical Society*, volume 63, page 889. As in preceding editions, terms are carefully defined when first introduced, and little mathematics is used.

FELSING WILLIAM AUGUST AND GEORGE W WATT

General chemistry Third edition. New York McGraw Hill Book Company Inc., 1951 556 p. illus. 24 cm. $6.00 1117

Contents (abridged): Forms of matter. Weight relationships. The structure of atoms. Properties of gases. Relative weights of molecules. Solutions. Acids, bases, and salts. [illegible]. Ionization. Ion equilibria. Classification of the elements. Colloids. Electrolysis. Industrial electrochemical processes. Battery cells. Metals and alloys. Heavy metals. Some binary compounds of nonmetallic elements. Commercial production of acids and bases. Nuclear chemistry. Organic chemistry. Appendix. Answers to problems. Index.

Note: An introduction to the fundamentals of chemistry for first year college students. The chief differences between this and the previous edition are [illegible] greater emphasis on structure [illegible] and [illegible] rearrangement in the order of subject presentation. Thus, atomic structure is now discussed in the fourth instead of the fourteenth chapter and nuclear chemistry is deferred until the final chapter. The subject of chemical equilibria is treated in greater detail, and the number and variety of review problems have been increased. Answers to numerical problems are included.

GLASSTONE, SAMUEL

Theoretical chemistry an introduction to quantum mechanics statistical mechanics, and molecular spectra for chemists. Princeton D Van Nostrand Company Inc., 1944 515 p. illus. 23 cm. $7.00 1118

Contents: Introduction. Quantum numbers. Quantum mechanics. Quantum theory of valence. Molecular spectra. Diatomic molecules. Molecular spectra: Polyatomic molecules. The electronic configurations of diatomic molecules. Statistical mechanics. Statistical thermodynamics. Intermolecular forces. Index.

Note: An elementary knowledge of calculus, including differential equations, is [illegible] prerequisite for this advanced text for graduate chemists. Dissociation, [illegible], light absorption, valence force constants, and bond distances are [illegible] few of the topics discussed. Supplemental references are provided in the preface and as footnotes.

HATCHER, WILLIAM HOOKER

An introduction to chemical science. Second edition. New York John Wiley & Sons, Inc, 1949 449 p illus 22 cm $4 50 1119

Contents (abridged) Part 1 Inorganic chemistry: The chemist's stock in trade. The three states of matter The atmosphere. Carbon and life. Molecular and atomic weights. What is a chemical reaction? Acids, bases, salts. Colloidal solutions. The periodic classification of the elements. Part 2 Organic chemistry: Pictures from the paraffins. Organic nitrogen. The carbohydrates. Fats and oils—soap—paint. Explosives—dyes—pharmaceuticals. Part 3 Food chemistry Part IV Industrial chemistry: Raw materials and their sources. Catalysis in industry Ceramics. Petroleum. Chemistry in the home. Books for supplementary study Index.

Note An elementary college text designed for nonspecialist courses and liberal arts students. The treatment is largely historical, with emphasis on the practical applications of chemistry to modern life. In this revision the general format and scope of the original edition have been maintained, but some sections have been rewritten and new material included on properties of matter atomic weights, electrolysis, metals and alloys, and the vitamins. Each chapter concludes with a summary and review questions.

HILDEBRAND, JOEL H, AND RICHARD E POWELL

Principles of chemistry *Sixth edition* New York The Macmillan Company, 1952 444 p *illus 21 cm $5 00* *1120*

Contents Kinds of matter Weight relations in chemical reactions—atoms and molecules. The kinetic theory Molecular weights. The relation of chemical and physical properties to atomic structure. Concentration, acidimetry and alkalimetry Thermochemistry Electrolytic dissociation Combining proportions. Chemical nomenclature. The speed of chemical reactions. Chemical equilibrium—the effect of concentration. Types of equilibria. The effect of pressure and temperature upon equilibrium. Oxidation and reduction. The constitution of the atom. The periodic system of elements. Organic chemistry Dispersed systems. Solubility Carbonic acid and its ions. Acid-base systems. Structures of inorganic compounds. Appendices. Index.

Note. An introductory textbook in general chemistry which has been widely used in colleges and universities *in the United States* of America for many years. It offers a descriptive and essentially nonmathematical treatment, in which elementary theory nomenclature, and fundamental phenomena are emphasized. Unlike some introductory textbooks, there are few references to applications. The first edition was published in 1918 and the fifth edition in 1947 Minor rather than major changes were made in this sixth edition, which has the same organization and purpose as the fifth edition.

HOLMES, HARRY NICHOLLS

General chemistry Fifth edition New York The Macmillan Company, 1949 708 *p. illus* 22 cm. $6 50 1121

Contents (abridged) The composition of pure substances. The atomic theory Symbols, formulas, and equations. Gases. Liquids and solids. Valence. Water and hydrogen peroxide. Carbon and its oxides. Solutions. The simple halogen acids. Ions and electrolysis. The modern theory of acids and bases. Equilibrium. Sulfuric acid and the oxides of sulfur The periodic system. Structure of the atom. Nuclear chemistry The atmosphere. Nitrogen and ammonia. Colloid chemistry Compounds of the metals. Preparation of the metals. Electrochemistry The aliphatic hydrocarbons. Rubber The *aromatic hydrocarbons The carbohydrates.* Cellulose and its esters. Dyeing. Plastics. Food and nutrition—chemotherapy Radiation chemistry Appendix. Index.

Note A widely used introductory textbook. Although it is designed for students who will take additional courses in chemistry about as much space is given to descriptive chemistry as to basic principles. The fourth edition was published in 1941 A considerable range of new material has been added in this edition in order to bring the work abreast of the many advances in chemical knowledge and the applications of chemistry in the past decade.

HOLMES, HARRY NICHOLLS

Introductory college chemistry Fifth edi*tion.* New York The Macmillan Company 1951 594 p illus 22 cm. $6 00 1122

Contents (abridged): The field of chemistry Matter and energy Atoms and molecules. The composition of pure substances. Hydrogen. Oxygen. Gases. Liquids and solids. Electrovalence and covalence. Water and hydrogen peroxide. Solutions. Chlorine, bromine, iodine, and fluorine group VIIB. The alkali metals, group IA. Bases. Ions and electrolysis. Equilibrium. Structure of the atom. Radioactivity Nuclear chemistry Atomic fission. Sulfur and hydrogen sulfide. The atmosphere. Nitrogen and ammonia *Nitrogen fixation. The phosphorus group VB* Carbon and silicon IVB Compounds of the alkali metals, IA. Compounds of copper silver and gold, IB. Compounds of zinc, cadmium, and mercury IIB Compounds of *aluminum and boron, IIIB* Compounds of tin and lead, IVB. Compounds of chromium and manganese, VIA and VIIA. Compounds of iron cobalt, and nickel, VIIIA. The platinum group. Properties and uses of the metals. Alloys. Steel. Electrochemistry Colloid chemistry The aliphatic hydrocarbons. Rubber The aromatic hydrocarbons. The carbohydrates. Cellulose and its esters. Plastics. Nutrition. Chemotherapy Appendix. Index.

Note An introductory textbook which has enjoyed wide use in American colleges since the publication of the first edition in 19 8 As is common in such books, the basic topics in organic and inorganic chemistry are covered in a descriptive fashion with enough references to applications to hold the interest of beginning students. The fourth edition was published in 1946. A fair amount of material on such topics as atomic energy and titanium, synthetic fibers, plastics, and the hydrogen bomb has been added in this edition. A more important change is the rewriting of the sections on atomic structure so as to place more emphasis on this knowledge.

HOPKINS, B SMITH, AND JOHN C BAILAR, JR.

General chemistry for colleges Fifth edition Boston D C Heath and Company, 1956 701 p illus. (part col d) 24 cm. $6 75 1123

Contents (abridged): Fundamental concepts and laws. Measurements—elements—compounds. Atomic structure—valence. Gas laws—kinetic theory Solutions. Colloid chemistry Gas volumes—molecular and atomic weights. Chlorine. Chemical equations. Hydrogen halides. Electrochemistry Acids and bases. Compounds of nitrogen. Carbon and its inorganic compounds. The metallic elements. The alkali metals. The alkaline earth metals. Zinc, cadmium, and mercury Chromium and related elements. Cobalt, nickel, and the platinum metals. The chemistry of the nucleus. Appendix. *Index.*

Note A standard introductory textbook written by a former and present member of the faculty of the University of Illinois. Basic principles are well covered, and also there is a good deal of space given to descriptions of industrial chemistry and to technical applications of chemical principles. In its fifth edition, the book is organized in 41 chapters of which a selected number are listed by *title above. There are 73 tables of reference data,* a generous number of illustrations, and rather extensive reading lists. The fourth edition was published in 1951 In preparing the present edition, two chapters were extensively rewritten sections of others were revised, the literature lists were extensively revised, and new problems were substituted for those in earlier editions.

KING, G BROOKS, AND WILLIAM E CALDWELL

The *fundamentals of college chemistry* Second edition. New York American Book Company 1954 589 p illus. 23 cm. $5.50 1124

Contents (abridged) The atom, its structure and behavior The *periodic* classification of the elements. Formulas and equations. Oxygen. The gaseous state of matter Valence. Water and the liquid state. The solid state of matter Weight and volume relations between substances in chemical changes. *Solutions.* The halogens. Chemical equilibrium. The theory of ionization. Nitrogen and the atmosphere. The sulfur family Carbon and its oxides. The colloidal stat of matter The alkali metals. *Radioactivity* and nuclear changes Electrochemistry Copper silver gold. *Group IV metals*—tin and lead. Introduction to *organic chemistry Chemical* industry and *chemical engineering.* Appendix. Glossary Index.

Note A textbook for first courses in chemistry at the college level. As is common in such books, it combines elementary theory with descriptions of applications. Modern atomic *theory is* introduced in one of the early chapters, and ionic equations as well as molecular are used throughout the book in diagramming chemical reactions. Little mathematics is employed *in the exposition.* Selected literature references are included.

LAUBENGAYER, ALBERT WASHINGTON

General chemistry New York Rinehart & Company Inc., 1949 528 p. illus. 24 cm. 1125

Contents (abridged). The laws of chemical change and the atomic theory. Substances and formulas. Chemical reactions and equations. Energy and chemical change. The gaseous state. The liquid state. The solid state. Reaction rates and chemical equilibrium. Atomic structure and the classification of the elements. Chemical bonding. Electrolytic dissociation and ionic equilibrium. Ionic reactions. [illegible]. The halogens. The sulfur family. Nitrogen. Carbon and its inorganic compounds. Organic chemistry. Silicon and its compounds. The metals. Nuclear structure and radioactivity. Colloidal systems. Appendix. Index.

Note: An introductory textbook designed for first-year college students who require a sound knowledge of the fundamentals of chemistry in preparation for further work in the field or for work in such fields as physics, engineering, or in the biological sciences. Throughout the work, the exposition is closely related to the modern knowledge of the atom and other physical principles on which modern chemistry is based. Chemical bonding is explained in terms of electronic structure. The author is Professor of Chemistry at Cornell University. A revised edition was published in 1957 [illegible] p. $6 [illegible].

MANUFACTURING CHEMISTS ASSOCIATION, INC.

Guide for safety in the chemical laboratory Prepared by and published for The General Safety Committee of the Manufacturing Chemists Association Inc., Washington, D C. Princeton D Van Nostrand Company Inc., 1954 234 p. illus. 22 cm. $4.50. 1126

Contents. General rules for laboratory safety. Laboratory design and equipment. Handling glassware. Handling and storage of containers. Miscellaneous hazards. Flammability. Chemical hazards. Toxicity. Radiation safety and contamination control in the laboratory. Pressure vessel hazards. Clothing and personal protective equipment. Laboratory first aid and suggestions for medical treatment. The packaging and transportation of chemicals. Literature references. Index.

Note: A manual of basic information. In it are outlined good safety practices, safety features to be incorporated when chemical laboratories are designed, the chief hazards in chemical laboratories, and suggestions for first aid and medical treatment. In addition, protective clothing and equipment are described, and there is a selected bibliography of publications containing safety information. The information given is not generalized to the extent that readers will have to turn to other publications for specific details, rather the book is essentially self-contained, with most of the topics being covered concisely and adequately. Many of the 39 plates are reproductions of photographs of laboratories and equipment designed for safety.

MARTELL, ARTHUR EARL, AND MELVIN CALVIN

Chemistry of the metal chelate compounds. New York Prentice Hall, Inc., 1952 613 p. illus. 24 cm. (Prentice Hall chemistry series Wendell M Latimer editor) $10.00 1127

Contents. Introduction. Methods of determining the presence of chelates. Stability constants. Influence of the structure of the chelating agent. Effect of metal ion. Bond type. Structure of chelate compounds. Catalytic effects of chelate compounds. Separation of metal ions. Uses of chelating agents. Appendices. Chelate stability constants. Optical activity and related properties. Glossary of terms. Thermodynamic constants for reactions of metal with chelating agents. Author index. Subject index.

Note: The theoretical chemistry of the metal chelate compounds, their properties, and the uses of chelating agents are all covered in this work, which is both a comprehensive monograph and a reference book of useful data. The discussions of such topics as the influence of the structure of the chelating agent are supplemented by many tables of organized data, including a 45-page table of chelate stability constants. Hundreds of literature references are included as footnotes. The book is of interest to graduate chemists in several branches of chemistry including analytical chemistry, biochemistry, water treatment, and dyestuffs.

NAYLOR, NELLIE MAY, AND AMY LE VESCONTE

Introductory chemistry with household applications. Revised edition. New York D Appleton-Century Company Inc., 1941 476 p. illus. 21 cm (The Century chemistry series J Kendall editor) $4.00 1128

Note: This textbook is intended for use in the general chemistry course in women's colleges and in the course for home economics students in coeducational colleges. As compared with the earlier edition, the revised edition devotes more attention to fundamentals as is indicated by the new material in the chapters on the quantitative relations of acids and bases, the concepts of electrovalence, covalence, and coordinate valence and the complete revision of the chapters on atomic structure and radio activity. Recent theory that has become firmly established through research has been incorporated in the text, as for example, the Debye-Hückel theory as applied to solutions of salts, and strong acids and bases. Equations are introduced earlier; a new chapter has been added to cover recent industrial applications of chemistry of interest in the field of home economics—synthetic textile fibers, glass fibers, synthetic plastics, and new alloys. A list of suggested readings is now included at the end of each chapter, in addition to new questions similar to those in the first edition.

PAULING LINUS

College chemistry an introductory textbook of general chemistry Second edition. Illustrations by Roger Hayward. San Francisco W H. Freeman and Company 1955 685 p. illus. 25 cm. $6.50 1129

Contents (abridged). An introduction to modern chemistry. Some aspects of chemical theory. Some non-metallic elements and their compounds. Water, solutions, chemical equilibrium. Metals and alloys and the compounds of metals. Organic chemistry. Biochemistry, and nuclear chemistry. Appendices. Index.

Note. Dr Pauling is the author of two introductory college texts in chemistry. His General chemistry described below is widely used in the U.S.A. in courses offered to students who are planning to major in chemistry. Although several of the chapters are common to both books, College chemistry is a somewhat less difficult text. There is a similar emphasis on theory but the exposition is more leisurely and the mathematics is comparatively simple.

PAULING, LINUS

General chemistry, an introduction to descriptive chemistry and modern chemical theory Second edition. Illustrations by Roger Hayward. San Francisco W H. Freeman and Company 1956 710 p. illus. 24 cm (A series of chemistry texts Linus Pauling editor) $6.50 1130

Contents: The nature and properties of matter. Atoms, molecules, and crystals. The electron and the nucleus. Elements, elementary substances, and compounds. The chemical elements and the periodic law. Weight relations in chemical reactions. Quantum theory and molecular structure. Ions, ionic valence and electrolysis. Covalence and electronic structure. Oxidation-reduction reactions. The chemistry of the halogens. The laws of electrolysis—electrochemical processes. The properties of gases. Water. The properties of solutions. Sulfur, selenium, and tellurium. Nitrogen, phosphorus, arsenic, antimony, and bismuth. The rate of chemical reactions. Chemical equilibrium. Acids and bases. Solubility product and precipitation. Complex ions. The nature of metals and alloys. Chromium and manganese, and related metals. Iron, cobalt, nickel, and the platinum metals. Copper, zinc, gallium, and germanium, and their congeners. Organic chemistry. Biochemistry. The chemistry of silicon. Thermochemistry. Oxidation-reduction equilibria. Nuclear chemistry. Appendices. Index.

Note: A distinguished textbook designed specifically for the instruction of undergraduate college students who are planning to

specialize in chemistry A moderate amount of descriptive chemistry—that is to say accounts of applications of chemical principles in industry etc.—is included, but most of the space is devoted to theory properties of compounds, and descriptions of reactions. The illustrations include numerous reproductions of three-dimensional drawings based on molecular models. The first edition was published in 1948. In preparing this edition, a number of changes were made, including the addition of two chapters on the electron and the nucleus, the quantum theory and molecular structure.

ROCHOW, EUGENE G, AND M KENT WILSON

General chemistry a topical introduction New York John Wiley & Sons, Inc., 1954 602 p illus 24 cm. $6 50 1131

Content (abridged) The cause of it all—the structure of atoms and molecules. Organization in nature—the periodic system of the elements. Introduction to gases—the kinetic molecular theory and its practical applications. Chemical equilibrium—the rates of chemical reactions and the concept of dynamic equilibrium—acids, bases, and pH. Hydrogen peroxide and oxidations in general—the concept of oxidation number and its use. The sea as a chemical storehouse Sulfur and its compounds. The connection between chemistry and electricity—oxidation potential, cells, batteries, and electrolysis. Heat of chemical reactions—the interchange of chemical and thermal energy Photochemistry—the emission and absorption of light by chemical systems. Piezochemistry—the effect of pressure on chemical reactions. Nitrogen—unwilling but useful element. Organic chemistry—variety and versatility on the part of element 6. Photosynthesis—inimitable production of organic compounds. Chemotherapy—chemical agents in medicine Macromolecules—size transcends composition. Metals in theory and practice. Radiochemistry—the theory and practice of nuclear reactions. Our resources—our inheritance of materials and sources of energy Appendixes The history of chemistry Some mathematical concepts and operations. Review of chemical arithmetic. Answers to problems. Index.

Note A textbook for freshman college students, written by two faculty members of the Department of Chemistry of Harvard University The organization and content differ considerably from the typical introductory chemistry text of a decade or so ago. For instance, the authors have not attempted to cover systematically all of the elements in the periodic table, nor have they devoted much space to descriptions of groups of compounds. Missing also are the usual descriptions of industrial chemical processes. On the other hand, fundamental knowledge, such as atomic and molecular structure, is carefully explained. The reader's interest is held by (1) a readable style and (2) the inclusion of numerous passages which relate chemical science to man's present and future needs.

SANDERSON, ROBERT THOMAS

Vacuum manipulation of volatile compounds a laboratory manual describing the application of high vacuum technique in experimental chemistry New York John Wiley & Sons, Inc. 1948 162 p illus. 22 cm. $5 50 1132

Contents Introduction to chemical high vacuum technique. Materials of construction and operation. Glass blowing. Producing high vacuum. Measuring pressure. Low temperatures. Valves. Introducing into and removing from vacuum system Measuring volumes. Measuring vapor pressure Condensation traps and fractionation. Miscellaneous suggestions and methods. Practice in high vacuum technique. A general utility high vacuum apparatus. Future developments. Appendix. Author index. Subject index.

Note As the title indicates, this manual has been written to provide the chemical research worker with a practical knowledge of the fundamental principles and methods of high vacuum technique. It describes in detail the actual construction of a laboratory high vacuum system and the procedures to be followed in carrying out typical quantitative analyses. Particular attention is given to the intricacies of handling minute quantities of material. The appendix includes a tabulation of the melting points, boiling points, and vapor pressure for 198 pure compounds.

SCARLETT, ANDREW J AND JOSÉ GÓMEZ IBÁÑEZ

General college chemistry New York Henry Holt and Company 1954 645 p illus 24 cm. $6.50 1133

Contents (abridged) Part 1, Fundamental principles and the kinetic theory of matter Chemical properties and the periodic table. The structure of matter and the chemical bond. Chemical equilibrium and solutions of electrolytes. The chemistry of the elements. Compound substances. Thermochemistry colloids, nuclear reactions. Appendix. Index.

Note A successor to *General college chemistry* by Leon B. Richardson and Professor Scarlett. As was the earlier work, it is intended for the instruction of college students taking their first courses in chemistry It is organized in the seven parts whose titles are given above and in 39 relatively short chapters. More attention is given to fundamental principles, the structure of matter, the laws of chemical equilibria, etc., than to describing the properties of chemical elements. Nevertheless, more than 200 pages are devoted to descriptive chemistry The senior author is a member of the faculty of Wesleyan University

SCHLESINGER, HERMANN IRVING

General chemistry Fourth edition, completely revised and rewritten New York Longmans, Green and Company, 1950 811 p. illus 21 cm $5 75 1134

Contents (abridged) Some fundamental concepts of chemistry *The kinetic molecular theory Critical phenomena* and the liquefaction of gases. Atomic theory and atomic weights. Introduction to chemical equilibrium. Heats of formation of oxides. Atomic structure. The behavior of ions and ionic compounds. The law of chemical equilibrium. The alkali and the alkaline earth groups. The halogens. Nitrogen and some of its compounds. Organic chemistry and its contribution to chemistry as a whole. Silicon and some of its compounds. The colloidal condition. The copper group. The zinc group. Radioactivity and atomic fission. Appendixes. Index.

Note One of the more successful introductory texts in general chemistry In contrast to some books of the kind, it presents a systematic and fairly solid introduction, with some material on relatively advanced topics in chemistry It has some reference value, especially in such features as the 31-page table of physical properties of the inorganic compounds. In comparison with the previous edition, this one has been reorganized, and the type has been reset. Discussions of a considerable number of new topics have been added.

SELWOOD, PIERCE W

Magnetochemistry Second edition, completely revised and rewritten. New York Interscience Publishers, Inc., 1956 435 p. illus. 24 cm. $11 50 1135

Content Classical determination of average susceptibility The measurement of principal susceptibilities. Specific magnetization and thermomagnetic analysis. Resonance methods. Atomic diamagnetism. Molecular diamagnetism. Molecular diamagnetic anisotropy Atomic paramagnetism. Some applications of atomic paramagnetism. Coordination compounds. Molecular paramagnetism. Ferromagnetism. Antiferromagnetism. Metallic diamagnetism and paramagnetism. Magnetochemistry and heterogeneous catalysis. Author index. Subject index.

Note The author of this book has indicated his purpose in the following words "... I have tried to show what information of chemical nature may be obtained from magnetic measurements and to indicate in some detail how these measurements may be made. ... In its present form, the book is the most complete treatment available of its subject. Experimental techniques, instruments, and the applications of results to various problems in chemistry particularly structural chemistry are all covered. It is based on a wide literature survey and important statements in the text are keyed to citations of the source articles. The first edition was published in 1943 This edition, although written from the same viewpoint, is essentially a new work covering both basic knowledge and applications developed in the past 23 years. The author is a faculty member of the Department of Chemistry of Northwestern University

SNEED, M CANNON, AND OTHERS

General college chemistry By M Cannon Sneed, J Lewis Maynard and Robert C. Brasted Second edition. Princeton D Van Nostrand Company Inc., 1954 693 p. illus. (part col d) 24 cm $6 50 1136

Contents (abridged) Structure of atoms and molecules. The periodic system. Formulas, equations, valence, and chemical arithmetic. Hydrogen. Water and hydrogen peroxide. The gas laws and the kinetic theory. Molecular weights, equivalent weights, and atomic weights. The halogens. Oxidation and reduction. Solutions. The velocity of chemical reactions and equilibrium. Solutions of electrolytes and ionic theories. Electrochemistry. Sulfur, selenium, tellurium, and polonium. Nitrogen and compounds. The phosphorus family. Introductory organic chemistry. Applied organic chemistry. Silicon. Boron. The alkali metals. Beryllium, magnesium, and the alkaline-earth metals. Radio-activity. Elements of Group III. The transition elements of Groups IV and [illegible]. The transition elements of Groups VI and VII. Iron, cobalt, and nickel. The actinoid (actinide) series. Appendices. Some selected lecture demonstrations. Index.

Note: Three members of the faculty of the School of Chemistry of the University of Minnesota are the authors of this textbook which is designed for use in full-length introductory college courses. It offers [illegible] broad view of the field, including both inorganic and organic chemistry. The main emphasis is on basic theory and phenomena, but some space is devoted also to applied chemistry. Many data on individual compounds are included by the device of presenting this information in tabular form. Ignoring the tables in the appendix, there are 114 in this second edition. The first edition was published in 1944. The second edition represents [illegible] thorough revision and some reorganization. The nomenclature has been changed to that recommended by the Commission of the International Union of Chemistry for the Reform of Inorganic Chemical Nomenclature in 1940. More space is given to organic chemistry and the treatment of some topics has been shortened.

TIMM JOHN ARREND

General chemistry Third edition. New York McGraw Hill Book Company Inc. 1956 636 p. illus. 23 cm. $6 50 1137

Contents (abridged) Matter. Atoms and molecules. The properties of gases. The kinetic-molecular theory. The periodic table. Subatomic particles. Atomic structure. Valence. Oxidation number. Oxygen. Hydrogen. Water. The halogens—group VII. Solutions. Reaction velocity and equilibrium. Reactions of acids and bases. The alkali metals—group IA. Oxides and oxygen acids of sulfur. Nitrogen and ammonia. The alkaline-earth metals—group IIA. Phosphorus, arsenic, antimony and bismuth—group VA. Boron and aluminum—group IIIA. Carbon, silicon, germanium, tin, and lead—group IVA. Colloids. Copper, silver and gold—group IB. Zinc, cadmium, and mercury—group IIB. Iron, cobalt, nickel, and the other metals of group VIII. Chromium, manganese, and other transition metals. The aliphatic hydrocarbons and their derivatives. The aromatic hydrocarbons. Biochemistry. Transmutations and nuclear energy. Appendix. Index.

Note: An established introductory text in which theoretical information and descriptive material on the applications of chemistry are combined with basic knowledge [illegible] a readable work suitable for first-year college students and for other readers in search of factual information. The illustrations include small reproductions of [illegible] large number of photographs of chemical applications. The second edition was published in 1950. Although there are fewer pages in this third edition, [illegible] amount of material has been added, [illegible] chapters and parts of chapters have been rewritten to make them clearer and easier to comprehend. A few recent books and articles have been added to the bibliography.

WHITTAKER, ROLAND MAPES

Rudiments of chemistry the chemist's view of the nature of matter New York The Ronald Press Company 1947 310 p illus. 21 cm. $5.50 1138

Contents (abridged) Fundamental ideas. Classification and properties of matter. Changes in matter. Symbols, formulas, equations. Mechanics. The atoms change, chemical reactions occur. The larger units of matter. The three states of matter. Molecular and atomic weights. The dispersed condition. Ionization and electrolytes. Chemical equilibrium. Appendices: Units and conversion factors. The expression of numbers. Suggested lecture demonstrations. Index.

Note: An interesting and successful attempt to expound concisely the basic chemical laws, theories, and phenomena without cluttering the text with accounts of chemical industries and other descriptive material. Special emphasis is placed on modern theories of atomic structure. Chapter reading lists refer the reader to selected periodical articles, text- and reference-books for fuller treatments of the various topics. The book is suitable for use in cultural or survey-type college courses in chemistry and may also be studied with profit and enjoyment by the lay reader. The author is Chairman of the Department of Chemistry at Queens College, New York.

WISWESSER, WILLIAM J

A line formula chemical notation. New York Thomas Y Crowell Company 1954 149 p. illus 22 cm. $7 00. 1139

Contents: Part one, The system of symbols. The international atomic symbols. New atomic group symbols. Auxiliary symbols. Part II, Aliphatic (open-chain) compounds. The line formula convention. Miscellaneous open-chain details. Systematic contractions. Part III, Cyclic compounds. Benzene derivatives. Other monocyclic compounds. Bicyclic compounds. Polycyclic compounds. Appendices. Indexes.

Note: Described in this important book is [illegible] new system of symbols for indicating the structure of molecules by means of a single line of type without the use of subscripts or superscripts. The notation can be typed on [illegible] standard typewriter keyboard, and it is adaptable to literature searching on punch-card machinery. These four "general propositions" or rules that govern the choice of symbols are quoted from the book: 1. Reserve capitalized letter symbols to denote atoms or atomic groups. 2. Reserve punctuation marks to denote modes of connection or disconnection. 3. Reserve numeric symbols to denote absolute numerical measures, such as the number of skeletal atoms in [illegible] ring or an alkyl chain. 4. Reserve lower-case letters (rather than numbers) as locants to locate valence ring positions. The system is described fully and in detail, and review exercises for readers' practice are included.

ANALYTICAL CHEMISTRY

AHRENS LOUIS HERMAN

Spectrochemical analysis Arranged particularly for the D. C. arc analysis of minerals, rocks and soils and applicable also to ceramic materials, refractories, slag biological ash and powders in general Foreword by George R. Harrison. Reading, Mass Addison-Wesley Publishing Company Inc., 1950 269 p illus. 23 cm. $12.00 1140

Contents (abridged) Part I, General principles: The origin and interpretation of spectra. Some physical features of the D. C. arc discharge. Power for the arc source. Qualitative analysis. Selective volatilization. General principles of quantitative analysis. Effect of change of composition on line intensity. The photographic measurement of radiant energy and the construction of [illegible] working curve. The emission of band spectra from the arc. Part II, The elements. Bibliography. Author index. General index. Wavelength tables.

Note: The author of this practical treatment has not assumed that his readers will have had any previous experience with spectrochemical analysis, but he has assumed familiarity with basic physical concepts and terminology and with basic chemistry. The first part of the book is devoted to the general aspects of spectrochemical analysis. In the second part, semi-quantitative and quantitative analytical methods applicable to specific elements are described in detail. Numerous special points based largely on the author's experience are included in the descriptions of procedures. There are copious references to the related literature. The book is of particular interest to workers in geochemistry but it has application to analytical work in many other fields.

ALTIERI V JOSEPH

Gas analysis & testing of gaseous materials New York American Gas Association, Inc., 1945 567 p. illus. 23 cm. $7.50. 1141

Contents: Introduction. The composition of gases. Measurement of quantity and flow of gas. Selection of method of sampling. Apparatus and reagents. Common operations. Calculations of gas analysis. Official inspection and testing. The Hempel type of apparatus and method. The Orsat apparatus and its modifications. The Elliott and Macdonald methods. The Shepherd apparatus and methods. Methods for small amounts of nitric oxide, carbon monoxide, olefins, oxygen, hydrogen sulfide, cyanogen, and hydrocyanic acid. Dusts, sprays, fumes, mists, and similar dispersoids. Liquefaction and distillation methods of analysis. The determination of sulfur compounds. Light oils in gas. Naphthalene in gas. Density and specific gravity. Analysis of raw gases. Appendix. List of illustrations. List of tables. Bibliography. Name index. Subject index.

Note: This work is intended to supersede the gas analysis portion of the *Gas chemists' handbook* New York, 1929 and [illegible]

amount of material that appeared in that work has been included. The present work is intended for use by gas chemists as a guide to standard procedures of analyzing and testing. Specific directions for apparatus, procedure and interpretation of tests are given. There are many illustrations of apparatus. The appendix contains about 40 pages of useful reference data, and there is an extensive bibliography

AMERICAN CHEMICAL SOCIETY
Reagent chemicals Specifications, 1955 Washington, D C American Chemical Society, 1955 428 p 24 cm $6 50 1142

Contents: Definitions, procedures, and standards. Specifications. Index.

Note. A well-sponsored and carefully prepared reference book of specifications for reagents to be used in precise analytical work. It was prepared by the American Chemical Society's 1955 Committee on Analytical Reagents. A 22-page introductory section on definitions, procedures and standards is followed by standardized specifications for the reagents which are included. For each reagent, the official requirements are stated, and standardized tests for various types of impurities are described. The arrangement is alphabetical by name of the reagent, such as Ferrous sulfide, Potassium hydroxide, and Zinc sulfate. This edition supersedes the edition of 1950 and its appendix published in 1953 in *Analytical chemistry* Vol. 25 p. 165–80. Many of the older specifications, including those given in the appendix just mentioned have, of course, been carried over without change or with small changes into the present edition of the book.

AMERICAN SOCIETY FOR TESTING MATERIALS
Index to the literature on spectrochemical analysis, 1920–1939 Second edition By William F Meggers and Bourdon F Scribner Philadelphia The American Society for Testing Materials, 1941 94 p 22 cm $1 50 1143

—— Part II, 1940–1945 By Bourdon F Scribner and William F Meggers. Philadelphia The American Society for Testing Materials, 1947 180 p 23 cm $3 00 1144

—— Part III 1946–1950 By Bourdon F Scribner and William F Meggers. Philadelphia The American Society for Testing Materials 1954 226 p 23 cm $4 50, parts I III $7 50 1145

Note. In its three parts, this useful bibliography now covers the international literature bearing on spectrochemical analysis from 1920 through 1950. Within each part, the organization is by calendar year and in alphabetical order of authors' names within each calendar year. Each part contains its own indexes, including adequately detailed subject indexes. No abstracts were given in Part I, although references to published abstracts were included. In both Part II and Part III, abstracts are included. In most cases, the abstracts are quoted verbatim from *Chemical abstracts*, but in a few instances they are abridged or quoted from other publications or are especially prepared from this index.

AMERICAN SOCIETY FOR TESTING MATERIALS
Report on standard samples for spectrochemical analysis, 1955 Prepared by Robert E Michaelis National Bureau of Standards, for ASTM Committee E-2 on Emission Spectroscopy Philadelphia The American Society for Testing Materials, 1956 90 p 23 cm (Technical publication no 58-C) $2 75 1146

Contents. Introduction. Available standard samples. Available reference samples. Available high-purity materials. Appendices. Standard samples in preparation.

Note. In a series of 47 tables, accompanied by explanatory text, this reports states the exact chemical analyses of standard samples obtainable from approximately 34 suppliers in the United States of America and Canada, whose names and addresses are given. The total number of entries of standard samples, reference samples, and high-purity materials described and listed is 2,100. Included also is a report of a new survey on standard samples for spectrochemical analysis, conducted for Committee E-2's Subcommittee IV. Five appendix tables provide information on standards in preparation.

AMERICAN SOCIETY FOR TESTING MATERIALS
Symposium on flame photometry Presented at the fifty fourth annual meeting, American Society for Testing Materials, Atlantic City, N J., June 19, 1951 Philadelphia American Society for Testing Materials, 1952 120 p illus 23 cm. (Special technical publication no 116) $2.00 1147

Contents: Introduction, by R. O. Clark and L. R. Pritchard. A review of flame photometry, by V. M. Meloche. A stable internal standard flame photometer for sodium, potassium, lithium and calcium analyses in biological fluids and a study of ion interference, by C. L. Fox, Jr. and others. Use of the Beckman and Perkin-Elmer flame photometers for the determination of alkalies in Portland cement, by J. J. Diamond and L. Bean. Applications of flame photometry for the analysis of alkalies in silicates, waters and metals, by J. L. Gilliland. The determination of lithium oxide in Portland cement by flame photometer by W. J. McCoy and O. O. Christiansen. Control of interferences caused by acids and salts in the flame photometric determination of sodium and potassium, by F. T. Eggertsen and others. The effect of organic solvents on the flame photometric emission of certain elements, by O. W. Curtis and others. Determination of tetraethyllead in gasoline by flame photometry by P. T. Gilbert, Jr. Determination of calcium in lubricating oil by flame spectrophotometer by M. L. Moberg and others. A modified recording flame photometer by W. H. King and W. Priestley Jr. Flame photometer in the analysis of water and water-formed deposits, by R. K. Scott and others. General discussion.

Note: Recent developments in the field of flame photometric analysis form the basic theme for the papers in this symposium. Each paper is the work of an expert engaged in active research, and in most cases is the report of an original contribution to the subject. Applications of the technique in the analysis of industrially useful substances are emphasized. Bibliographies and discussions are included.

ARTHUR, PAUL AND OTTO M SMITH
Semimicro qualitative analysis Third edition New York McGraw Hill Book Company, Inc., 1952 285 p illus 23 cm (International chemical series L P Hammett, consulting editor) $4.25 1148

Contents Part I, Theory Introduction—review of elementary principles. Solutions. Theories of ionization. Homogeneous ionic equilibrium. Heterogeneous equilibrium—solubility product. Colloids—coprecipitation. Hydrogen sulfide and metal sulfides. Ionization of water—pH—hydrolysis. Complex ions—Amphoteric substances. Oxidation-reduction reactions. Part II, Analytical procedures. Semimicro technique Cation analysis. Anion analysis. Appendix. Index.

Note. Theory and other basic information and laboratory procedures are separated in this third edition of a standard introductory textbook. The theoretical part is 161 pages long, the analytical part 100 pages long. The ground covered is traditional for introductory courses in qualitative analysis, and the treatment also is primarily classical. However modern theory such as Brønsted' acid-base theory is also introduced. An important feature is that the analytical procedures are based on the use of samples consisting of about one ml. of solution, or from 10 to 100 mg of solid. The first edition was published in 1942 In this third edition,

the organization of the book and its scope are essentially the same, but various sections and paragraphs have been rewritten in the interests of clarity and discussions of some concepts not considered in the second edition have been introduced, among other changes.

ASSOCIATION OF OFFICIAL AGRICULTURAL CHEMISTS

Official methods of analysis of the Association of Official Agricultural Chemists. Editorial Board William Horwitz, chairman and editor Committee on Editing Methods of Analysis H. J Fisher A. H. Robertson and Helen Reynolds. Eighth edition. Washington, D C. The Association of Official Agricultural Chemists, 1955 1,008 p. illus. 24 cm. $12.00 $12.50 outside U.S.A. 1149

Contents: Agricultural liming materials. Fertilizers. Soils. Caustic poisons. Pesticides. Plants. Baking powders and baking chemicals. Beverages: nonalcoholic and concentrates. Beverages: distilled liquors. Beverages: malt beverages, sirups and extracts, and brewing materials. Beverages: wines. Cacao bean and its products. Cereal foods. Coffee and tea. Dairy products. Eggs and egg products. Enzymes. Fish and other marine products. Flavoring extracts. Fruits and fruit products. Gelatin dessert preparations, and mixes. Grain and stock feeds. Meat and meat products. Metals, other elements, and residues in foods. Nuts and nut products. Oils, fats, and waxes. Preservatives and artificial sweeteners. Spices and other condiments. Sugars and sugar products. Vegetable products, processed. Waters, mineral, and salt. Drugs. Cosmetics. Coloring matters. Extraneous materials: isolation. Microbiological methods. Microchemical methods. Nutritional adjuncts. Radioactivity. Spectroscopic methods. Standard solutions. Reference tables. General index.

Note: New editions of this standard reference book have been issued by the Association at five-year intervals beginning in 1920. Between editions the Association carries on continuous study and development of analytical methods as applied to agriculture; the findings are reflected in the quinquennial revision and republication of the "Methods of analysis." The result is an up-to-date working laboratory manual for the analytic chemist concerned with food and related products. Developments in instrumental technique have permitted many simplifications of method in the eighth as compared with the preceding edition, e.g., the extension of such techniques as chromatography to the isolation of substances from materials refractory to other means of separation. Revised or replaced by newer and more efficient methods have been certain time-honored methods of analysis, such as the Kjeldahl methods for nitrogen, the gravimetric methods for vanillin and coumarin, and the fermentation methods for thiamine. The vitamin chapter has been renamed "Nutritional adjuncts," and there is a new chapter on spectrographic methods. The selected bibliographical references, which appear at the ends of the chapters, have been brought up to date by the inclusion of pertinent citations from recent technical journals.

BARBER HERVEY HUBBARD AND T IVAN TAYLOR

Semimicro qualitative analysis. Revised edition. New York Harper & Brothers, 1953 404 p. illus. 24 cm. (Harper's chemistry series William Marshall MacNevin editor) $5.00. 1150

Contents: Part I, Semimicro qualitative analysis for the cations. Introduction—terms of qualitative analysis. Concentration of solutions—calculations. Chemical reactions and equations. Laboratory methods in semimicro qualitative analysis. Directions for laboratory work. General scheme of qualitative analysis for the cations. Preliminary experiments and reactions for group I cations. Analysis of group I cations. Preliminary experiments and reactions for group II cations. Analysis of group II cations. Preliminary experiments and reactions for group III cations. Analysis of group III cations. Preliminary experiments and reactions for cations of groups IV and V. Analysis of cations of groups IV and V. General unknown solution for cations. Analysis of metals and alloys—identification of the cation and anion in simple solid salts. Part II, Qualitative analysis for the anions. General scheme of qualitative analysis for the anions. Preliminary experiments and properties of group I anions. Analysis of group I anions. Preliminary experiments and properties of group II anions. Analysis of group II anions. Preliminary experiments and properties of group III anions. Analysis of group III anions. Tests for group IV ions. Analysis of a general unknown solution—all anion groups. Systematic analysis of a solid unknown for cations and anions. Appendices. Index.

Note: A standard textbook designed for use in introductory college courses in chemical analysis. General directions for laboratory work, calculations, and other topics general to qualitative analysis are discussed for beginners. Analytical procedures are described in detail. There are numerous tables, in which information on procedures, reactions, and tests is presented concisely. The procedures permit the use of a simple apparatus consisting of a pressure filter tube and a rubber pressure bulb in place of the expensive centrifuge in filtration. Another feature is the use of thioacetamide in place of hydrogen sulfide in precipitations. However, directions are given for hydrogen sulfide precipitations and for filtrations based on use of the centrifuge for instructors who prefer these techniques. The first edition of the book was published in 1941. This revised edition represents a very extensive reorganization and revision.

BATES ROGER G

Electrometric *p*H determinations theory and practice. New York John Wiley & Sons, Inc. 1954 331 p illus. 24 cm. $7.50 1151

Contents: Fundamental principles and conventions. Definitions of *p*H scales. Liquid-junction potentials and ionic activities. Establishment of *p*H standards. Buffer solutions. Quantitative aspects of acidity and basicity in nonaqueous solutions. Cells, electrodes, and techniques. Properties of glass electrodes. Measurement of electromotive force. The *p*H meter. Automatic *p*H control. Appendix. Author index. Subject index.

Note: An important addition to the literature of *p*H determination. In the theoretical chapters (the first six) the problems of *p*H standardization with a view to the adoption of a practical electrometric scale of acidity are carefully examined from both the thermodynamic and practical standpoints. The latter four chapters are devoted to instrument elements and instruments including industrial control apparatus. Here emphasis is on selection, use, and the understanding of inherent errors. Specific descriptions of *p*H meters which are currently available from instrument manufacturers in the United States of America and Europe are included in these chapters. The book is addressed to graduate chemists, and the level of treatment assumes familiarity on the reader's part with the basic concepts of the field, the fundamentals of thermodynamics, and the necessary mathematical techniques. Literature references are supplied in the form of footnotes.

BELCHER, RONALD AND CECIL L WILSON

New methods in analytical chemistry New York Reinhold Publishing Corporation 1955 287 p. illus. 23 cm. $5.50 1152

Contents: Separation by precipitation. Separation by extraction. Inorganic precipitants. Organic reagents. Indicators. Titrants. Miscellaneous methods. Subject index. Author index.

Note: A professional-level reference book devoted to new analytical techniques which do not depend on the use of instruments—in other words, procedures which may be carried out with traditional laboratory equipment. Furthermore the authors selected only procedures which have appeared in the professional literature but had not been incorporated in the standard texts and reference books. Although most of the chapters begin with a paragraph or two of generalized discussion, the book is essentially a manual of specific individual procedures. The description of each procedure is full enough to enable the experienced analytical chemist to carry it out in the laboratory. References to the source publications are given. Entries in the index have been marked with a symbol to indicate whether the reference is to a gravimetric determination, titrimetric determination, synthesis, to a reagent or solvent, etc. This unusual feature facilitates use of the book for reference.

BENEDETTI PICHLER A A.

Essentials of quantitative analysis an introduction to the basic unit operations. New York The Ronald Press Company 1956 666 p. illus. 24 cm. $15.00 1153

Contents (abridged): Introduction. Measuring and weighing instruments. Preliminary tasks. Analytical operations. A course of

study Appendix Locating analytical procedures in the literature. Administration of the laboratory Tables. Index.

Note. A substantial and important addition to textbooks on quantitative analysis. Although designed primarily for student use, it will be useful to graduate chemists also because of its broad scope and numerous reference features. As indicated by the subtitle, the material is arranged according to basic unit operations, such as determinations of mass, volume, temperature, gas pressure; preparation of solutions mixing; mechanical separation of phases, etc. Most of the space is given to these operations, and only about 140 pages are devoted to procedures for specific analytical determinations. The author is Professor of Chemistry in Queens College of the City of New York.

BERL, WALTER G, editor

Physical methods in chemical analysis Volume III New York Academic Press, Inc., 1956 652 p illus 23 cm. $15 00 1154

Content Gas chromatography by C. S. G Phillips. Electrochromatography (zone electrophoresis, pherography) by T Wieland and K. Dose. Electroanalytical methods in trace analysis, by W D Cooke. High-frequency method of chemical analysis, by W J Blaedel and D L. Petitjean. Field emission microscopy by E. W Muller Theory and principles of sampling for chemical analysis, by A. A. Benedetti-Pichler. Flame photometry by K. W Gardiner Microwave spectroscopy by B P Dailey Analytical applications of nuclear magnetic resonance, by H. S. Gutowsky Fluorescent X-ray spectrometric analysis, by G L. Clark. Analytical distillation, by W J Podbielniak and S. T Preston. Neutron spectroscopy and neutron interactions in chemical analysis, by T I Taylor and W W Havens, jr Author index. Subject index.

Note Volumes I and II of this treatise, published in 1950–51 and now out of print, are described under number 332 of *Scientific, Medical and Technical Books Second Supplement*. This third volume contains the reviews of those authors and titles listed above. All treat methods of chemical analysis which have become important since the writing of the first two volumes, and all are critical surveys, accompanied by substantial lists of literature reference, and addressed to graduate chemists.

BIFFEN, FRANK M, AND WILLIAM SEAMAN

Modern instruments in chemical analysis. New York McGraw Hill Book Company, Inc., 1956 333 p illus 24 cm $7 50 1155

Contents Introduction. Emission spectroscopy Flame photometry Visual and ultraviolet absorption spectrophotometry Infrared spectrophotometry Raman spectroscopy Mass spectrometry X-ray diffraction. Survey of electroanalysis. Polarography Potentiometric analysis. Conductometric analysis. Coulometric analysis. Radioactivity Index.

Note Planned particularly for general analytical chemists and others who are concerned with analytical work in which instruments may be used, this book describes the instrumental techniques noted in the chapter titles. The organization of the chapters varies somewhat, but generally speaking th following points are covered in each basic principles, advantages, limitations, applications, typical commercial instruments, examples f analyses, and literature refer ences. The purpose of the book is to aid in selecting techniques and instruments to suit the needs of specific laboratories hence, although the terminology is that of professional chemistry the discussions are not highly technical.

BOLTZ, DAVID F, editor

Selected topics in modern instrumental analysis New York Prentice Hall Inc, 1952 477 p illus 24 cm. (Prentice-Hall chemistry series Wendell M Latimer editor) $7 00 1156

Contents Electrometric pH measurements, by G. A. Perley Polarographic analysis, by C. L. Rulfs. Fluorometric analysis, by C. E. White. Spectrophotometric analysis, by D F Boltz. Spectrochemical analysis, by J R. Churchill. Electrometric and opticometric methods of analysis, by D F Boltz. Analytical applications of x-ray diffraction, by E. J Black. Mass spectrometry by C. E. Berry and H F Wiley Raman spectroscopy by D R. Lang. Radiochemical analysis, by B F Rider Appendices. Index.

Note. The ever-increasing use of instruments in the analysis f organic and inorganic materials has given rise to college courses in this phase of analytical chemistry This text is designed for chemistry students taking such courses at the senior and graduate level. Each chapter has been prepared by a specialist in the field, and each type of instrument is discussed as to its fundamental principles, methods of construction and operation, and applications in chemical research. Brief bibliographies, review questions, and laboratory exercises are included.

BRODE, WALLACE REED

Chemical spectroscopy Second edition. New York John Wiley & Sons, Inc., 1943 677 p illus. (part col'd) 22 cm. $12 00 1157

Contents Introduction. Atomic and molecular spectra. Emission spectra (apparatus) Qualitative analysis, spectrum tables, and standard samples. Quantitative analysis. Resonance and chemical structure. Absorption spectra (apparatus and methods) Relation between molecular structure and absorption spectra. Application of absorption spectra data. Infrared and raman spectra. Colorimetry and fluorimetry Laboratory experiments. Theory and practice of photography Equipment and arrangement of a spectrographic laboratory Bibliography and references. Tables. Charts. Index.

Note For those dealing with spectrographic analysis of materials and other applications of emission and absorption spectroscopy While written primarily from the chemical standpoint, it will be found useful also by workers in physics, the biological sciences, metallurgy and engineering. The book constitutes practical working guide for the laboratory analyst. In this second edition the lists f spectrum tables and data for both emission and absorption spectra have been expanded. There has been a complete revision of all numerical (spectrum data) tables, with wavelength values based on the Harrison M. I. T Wavelength tables New York, Wiley 1939 This book includes the first published spectrum lines by elements based on these tables. The section on theoretical spectra has been carefully revised to conform with accepted modern notation. The section on quantitative emission spectra has been revised and expanded. Some new tables have been added, including persistent lines, lines for analysis, and conversion tables for transmission/extinction and wavelength/frequency The bibliography has been expanded.

BROWN, FRANK EMERSON

A short course in qualitative analysis Revised edition. New York D Appleton-Century Company, Inc. 1942 367 p illus. 23 cm. (The Century chemistry series, James Kendall, editor) $3 00 1158

Note. In order to adapt this college textbook for use with both types of analytical methods, adequate directions are given for macro analysis as well as for semimicro. Part I of the book is devoted to the theory of qualitative analysis Part II gives in detail simple, default procedures for the systematic analysis of inorganic substances Part III provides general directions for laboratory work, followed by laboratory report sheets for 51 experiments which parallel the procedures described in Part II. The principal new features of the revised edition are the revision of the text to fit the needs of semimicro courses, the inclusion of perforated laboratory sheets, a more logical organization of the material, and the enlargement of the format.

BURKE, OLIVER WALLIS JR, AND OTHERS, editors

Light hydrocarbon analysis analytical methods compiled and tested for the Office of Rubber Reserve Reconstruction Finance Corporation by the Butadiene Committee on Specifications and Methods of Analyses Edited by O W Burke, jr, C. E Starr, jr, and F D Tuemmler New York Reinbold Publishing Corporation 1951 639 p illus. 26 cm. $18 00 1159

Content History and function of the Committee on Butadiene Specifications and Methods f Analyses. Butadiene production processes. Butadiene specifications and applicable test methods. Schemes of analysis. Sampling and handling of light hydrocarbons. Analytical methods. Preparation of samples of known composition for test programs. Evaluation of accuracy and precision of methods. Index of appendix tables. Subject index.

Note: An important contribution to the literature of analytical chemistry. The heart of the volume is a collection of analytical methods that were compiled and critically evaluated by the committee formed in the task for use in connection with the synthetic rubber program of the United States government during World War II. In addition, there are full discussions of selected topics, such as safety precautions and methods of evaluating the results of analytical tests. Each of the analytical methods included is fully described, with information on the required apparatus, reagents, and the detailed procedure. The work is of interest to graduate chemists engaged in analytical work in the petroleum and gas industries and in other industries using petroleum gases as raw material.

CURTMAN, LOUIS JACOB

A brief course in qualitative chemical analysis from the standpoint of the laws of equilibrium and the ionization theory. New York: The Macmillan Company, 1936. 249 p. illus. 22 cm. $4.35 1160

Contents (abridged): Introduction. Qualitative analysis. Terms. Method of qualitative analysis. Limitations of tests. Part I, Theory. Chemical equations. Balancing equations. Solution of electrolytes. Theory of ionization. Modification of the theory of ionization. Chemical equilibrium. Application of the mass action law and ionization. Solubility product. Complex ions. Law of distribution. Theory of oxidation and reduction. Ion product of water. Buffer solutions. Hydrolysis of salts. Part II, The metal ions and the acids. Part III, Laboratory work. Part IV, Calculations. Appendix. Index.

Note: This textbook contains comprehensive material for an elementary course in which theory and laboratory work are closely co-ordinated to provide a scientific foundation for the prospective student of chemistry, medicine, dentistry, agriculture and engineering. Detailed explanations have been supplied for working all the difficult equations for the reactions of the metal ions and serve as a reference for the student. Instructions are also provided for the use of a system of individual reagents as developed by the author. Problems are given at the end of each chapter.

CURTMAN, LOUIS JACOB

Introduction to semimicro qualitative chemical analysis. Revised edition. New York: The Macmillan Company, 1950. 391 p. illus. (part col'd) 21 cm. $4.50. 1161

Contents (abridged): Introduction. Part I, Theory. Part II, The metal ions and the anions. Part III, Calculations. Part IV, Laboratory work. Part V, The anions and the complete analysis of mixtures. Appendix: Checking in. Checking out. Assignment schedule. Suggested lecture topics. Remaining notes. Desk equipment. Reagent solutions in student's rack. Side-shelf solutions and reagents. Reagents. Preparation of test, known and unknown solutions. The Bradford H_2S generator. Table—solubilities and solubility products. Table of inorganic compounds. Table of logarithms. Index.

Note: A college laboratory textbook and manual. In the procedures described, the quantities of samples, reagents, and the sizes of apparatus are reduced to a scale of one-tenth to one-twentieth of those employed in standard macro methods. Another feature is the emphasis on inorganic rather than organic reagents. In this edition important changes have been made in the laboratory procedures. The author is Emeritus Professor of Chemistry in the City College of New York.

CURTMAN, LOUIS JACOB

Qualitative chemical analysis. Revised edition. New York: The Macmillan Company, 1938. 514 p. illus. (part col'd) 22 cm. $5.90 1162

Contents (abridged): Introduction. Part I, Theory. Part II, The metal ions. Part III, Calculations. Part IV, Laboratory work—qualitative analysis. Part V, The acids or anions. Appendix: Remaining notes. Typical apparatus. Desk equipment. Reagents. The preparation of test, known and unknown solutions. The Bradford H_2S generator. The individual reagent system. Use and care of platinum crucibles. Table—solubilities and solubility products. Table of logarithms. Index.

Note: This text for college students is designed to provide an adequate basis for work in professional fields. A series of semimicro procedures has been included in the section on laboratory work. In the revised edition, discussions of the structure of compounds and the Brönsted theory of conjugate acids and bases have been added, part of the text has been rearranged, and a considerable portion has been revised. The volume is arranged so that it can be used for a short course or a full one. Also available from the same publisher is the author's *A brief course in qualitative chemical analysis*, New York, The Macmillan Company, 1936, 249 p., which contains selections from the larger text and is designed to be used in short courses.

CUTTING, THEODORE ABIJAH

Manual of spectroscopy. New York: Tudor Publishing Company, 1949. 220 p. illus. 22 cm. $6.50 1163

Contents: History and theory of spectroscopy. Light sources. Spectroscopes. Spectroscopic analysis. The spectroscope in mineralogy. Characteristic lines of the elements. Wave-length table—Chart. Appendix. Index.

Note: The main purpose of this book is to make spectroscopic techniques available to professional workers, such as chemists and assayers, who are now analyzing ores, alloys, and other inorganic materials by slower and less precise methods. The discussions of light sources, spectroscopes, and general techniques occupy approximately the first half of the book. The remainder is given over chiefly to tabulation of the characteristic lines of the elements, together with other information useful in work with minerals.

DAGGETT, ALBERT FREDERICK, AND WILLIAM BUELL MELDRUM

Quantitative analysis. Boston: D. C. Heath and Company, 1955. 470 p. illus. 24 cm. $5.50 1164

Contents (abridged): Part I, Principles and techniques. Introduction. Treatment of data. The analytical balance and weighing. Quantitative relations in basic equilibria. Gravimetric analysis—apparatus and techniques—representative determinations—sources of error—electrolytic principles and methods. Volumetric analysis—apparatus and its use—standard solutions—precipitation and complexation methods—acidimetric and alkalimetric methods—oxidation-reduction methods—sources of error. Part II, Laboratory procedures. Appendix. Index.

Note: In this textbook, which is intended for use in introductory college courses in quantitative chemical analysis, more than the usual proportion of space is devoted to basic theory and to techniques in general. Part I is 334 pages long, in contrast to the 100 pages of Part II. Laboratory directions for determinations and analyses are segregated in the latter part. The greater emphasis on the basic topics in Part I reflects the current tendency in American colleges to discard the traditional introductory course in qualitative analysis, thus making the course in quantitative analysis the first separate course in chemical analysis taken by many students. The book is well organized and is written in a full style that encourages reading. The appendix contains such reference material as lists of apparatus, reagents, and tables of constants.

DIEHL, HARVEY AND G. FREDERICK SMITH

Quantitative analysis: elementary principles and practice. New York: John Wiley & Sons, Inc., 1952. 539 p. illus. 24 cm. $5.50. 1165

Contents (abridged): The general operations of quantitative analysis. The calculations in gravimetric analysis. Mass action and the solubility-product principle. Volumetric analysis. Theory of neutralization reactions. The practice of neutralization reactions. The theory of oxidation-reduction reactions. The practice of oxidation-reduction titrations. Volumetric reactions involving the formation of insoluble or non-dissociated compounds. Colorimetry. Methods of effecting separations. Electrodeposition. The analysis of brass. The analysis of limestone. The determination of pH, colorimetric and potentiometric methods. Errors; accuracy and precision. Reference books. Appendix. Glossary. Index.

Note: A modern textbook in which quantitative analysis is presented for students with various interests in analytical chemistry. Although theory is not entirely omitted, the emphasis is on technique. Some instrumental techniques are covered, and the reagents mentioned include recently developed ones such as versene. The treatment does not assume a previous introduction to analytical chemistry in a course in qualitative analysis.

DOBBINS, JAMES TALMAGE

Semi micro qualitative analysis. New York John Wiley & Sons, Inc , 1943 422 p 22 cm. $5 50 1166

Contents. Introduction. Part I, Fundamental principles. Part II, The reactions of the cations Group 1 cations. Group 2 cations. Group 3 cations. Group 4 cations. Group 5 cations. Part III, Systematic analysis Group 1 cations. Group 2 cations. Group 3 cations. Group 4 cations. Group 5 cations. Part IV General properties of the anions Group 1 anions. Group 2 anions. Group 3 anions. Group 4 anions. Group 5 anions. Part V Systematic analysis of the anions Group 1 anions. Group 2 anions. Group 3 anions. Group 4 anions. Group 5 anions. Appendix. Index.

Note With the Periodic Table as a foundation, this elementary book co-ordinates and unifies the field of chemical reactions. It contains a set of experiments illustrating the fundamental principles a complete systematic scheme of separation of the anions and a scheme of separation of the cations in which the time required for a complete analysis is materially shortened. A series of problems illustrating and emphasizing the most important points rounds out the book.

DOBRINER, KONRAD, AND OTHERS

Infrared absorption spectra of steroids, an atlas By Konrad Dobriner, E R. Katzenel lenbogen, and R. Norman Jones Preface by C P Rhoads New York Interscience Publishers, Inc., 1953 XLV p, 308 1 $11 50 1167

Contents (abridged) Introduction. Atlas of spectra. Bibliography Numerical index of charts. Alphabetical index of charts.

Note. The greater part of this volume consists of reproductions of charts of the infrared absorption spectra of specific steroid compounds. The charts are arranged so that compounds containing similar functional groups are adjacent to one another. Each chart shows the spectrum of a particular compound and usually contains information on the experimental technique that is, the type of prism, cell length and solvent used in obtaining the spectra. Altogether there are 308 charts. The book is an important one for biochemists whose work involves the identification of steroid compounds.

ENGELDER, CARL JOHN

Fundamentals of semi micro qualitative analysis New York John Wiley & Sons Inc., 1947 385 p illus 22 cm $4 50 1168

Contents Part I, The cations. Introduction—reactions and equations—apparatus and technique—reagents. The theory of solutions—the analytical grouping of the common elements—the alkali metals. The law of chemical equilibrium the theory of precipitation the solubility-product principle—the alkaline earth elements. The elementary theory of oxidation and reduction—the theory of amphoterism—the theory of complex ions—the elements of group III. Ionization equilibria and buffer action the elements of groups I and II. Part II, The anions The classification of the anions—the anions of group I The pH value of solutions. The theory of neutralization and hydrolysis—the anions of groups II and III The anions of groups IV and V—the electrochemical theory of oxidation. Part III, Systematic analysis Systematic analysis. Appendix Colloids. Exponents and logarithms. Tables. Index.

Note In this introduction to the basic principles and methods of qualitative analysis every effort has been made to integrat theory and practice so that each phase of experimental work is accompanied by the appropriate theoretical preparation. Review questions and problems are given in sufficient number to eliminate the need for a special problem book. Although the text is based, to some extent, on an earlier volume, *Semi-micro qualitative analysis*, New York, 1940, of which Engelder was senior author the fresh approach to the subject and the inclusion of new materials justify its consideration as new work.

ENGELDER, CARL JOHN

A textbook of elementary quantitative analysis. Third edition. New York John Wiley & Sons, Inc. 1943 283 p 23 cm $3 75 1169

Contents Part I Fundamental principles of quantitative analysis. General considerations of quantitative analysis. Part II, Volumetric analysis The theory technique and calculations of volumetric analysis. Neutralization methods. Oxidation and reduction methods. Volumetric precipitation methods. Part III, Gravimetric analysis The theory technique and calculations of gravimetric precipitation methods. Representative gravimetric precipitation procedures. Part IV Systematic quantitative analysis. Systematic analysis. Appendix. Index.

Note A textbook for college students who have completed a course in qualitative analysis. In the third edition it has been largely rewritten. In the interest of more logical presentation, the material on volumetric precipitation methods immediately precedes that on gravimetric precipitation methods. Thus, the concepts of equivalent weights and normal solution are introduced with acids and bases. The volumetric procedure for chloride determination has been added. The entire content of the book has been modernized by the use of better indicators, less emphasis on titers, and similar changes. Brief outlines are given for the procedures for limestone and brass. A chapter on systematic quantitative analysis is now included. The amount of problem work has been increased, and the problems have been rearranged, some with and some without answers.

EWING, GALEN W

Instrumental methods of chemical analysis. New York McGraw Hill Book Company Inc., 1954 434 p illus 24 cm. $6 50 1170

Contents (abridged) Part I, Principles Introduction. Conductimetry Electromotive-force measurements. Voltammetry and polarography Electrodeposition. Emission spectroscopy The absorption of radiation. Turbidimetry, nephelometry and fluorimetry Infrared absorption The absorption and diffraction of X-rays and electrons. Polarimetry Refractivity and dispersion. Radioactivity as an analytical tool. Mass spectrometry The analysis of gases. Thermal analysis. The determination of water Extraction analysis. Chromatography Ion exchange. General considerations in analysis. Part II, Laboratory experiments. Appendix. Index.

Note. In this textbook for undergraduate college students the reader is introduced to the principles and methods of the main techniques of chemical analysis by instruments. Typical instruments are described, but the main emphasis is on the basic principles. The first part on principles runs to 351 pages, in contrast to the 53 pages devoted to laboratory experiments. In both parts, the level of treatment assumes that readers will have knowledge of basic chemistry and of the principles and techniques of introductory quantitative analysis. Literature references are included in both parts.

FERRIS, S W

Handbook of hydrocarbons. New York Academic Press, Inc. 1955 324 p 24 cm $8 50 1171

Contents Introduction. Hydrocarbons [illegible] the order of their boiling points at 760 mm Hg. Hydrocarbons arranged in groups of the same empirical formula and same type (alkane, alkene, alkyne, cyclane, cyclene, or aromatic) References. Alternate names for hydrocarbons with key to table B. Representative cyclic hydrocarbons. Appendix. Correction of boiling points.

Note. A standard reference book for chemists who are concerned with the identification of hydrocarbons. The titles of the tables quoted above indicate the main feature of their arrangement. Table A is an aid in the identification of an unknown hydrocarbon, once the boiling point has been determined. Table B is both key and supplement to Table A. The scheme of arrangement of this table is (1) number of carbon atoms (2) number of hydrogen atoms and (3) type of compound alkane, alkene etc. Table B gives the boiling points of specific hydrocarbons, hence is a key to Table A and to the other properties useful in identification which are tabulated there Tabl B also contains the literature references from which the data in both tables have been taken. Table C relates the many "trivial" or nonsystematic names found in the literature to the nomenclature employed in Table B. American Petroleum Institute Research Project 44 *Selected values of properties of hydrocarbons* and G. Egloff, *Physical constants of hydrocarbons*, are the primary sources on which the tables are based, but many other sources are cited also.

FISCHER, ROBERT B

A basic course in the theory and practice of quantitative chemical analysis. *Philadel*

phia W B Saunders Company, 1956 401 p illus. 24 cm. $5.50. 1172

Contents (abridged) Part i, Introduction Review of fundamental principles. The general unit operations and tools of quantitative analysis. Treatment of analytical data. Part ii, Gravimetric methods: The unit operations, tools and calculations of gravimetric analysis. Theory of the precipitation process. Part iii, Volumetric methods: The unit operations, tools and calculations of volumetric analysis. Neutralization theory Volumetric precipitation and complex formation methods. Oxidation-reduction methods—principles and theory Part iv Optical and electrical methods: Colorimetric methods Spectrophotometry and other optical methods. Electrodeposition methods. Potentiometric titrations, polarography and coulometry Part Appendices. Index.

Note: A textbook for first courses in quantitative analysis at the undergraduate college level. More space is given to theory than to procedures for experiments. In fact, the 35 experiments are not segregated but are scattered throughout the book at appropriate points in conjunction with discussions of theory, instruments, and other basic topics. The contents of the first three parts are essentially the standard contents of introductory courses in quantitative analysis as currently taught in colleges and universities in the United States of America. However, the chapter on the treatment of analytical data in the first part is somewhat longer and more rigorous than the discussion of this subject in most introductory texts. The fourth part describes selection of instrumental methods of quantitative analysis which the student who goes on to graduate and professional work will find of use in research and industrial laboratories. The chapters include suggested literature for additional reading. The author is Associate Professor of Chemistry in Indiana University.

FLAGG, JOHN FERARD

Organic reagents used in gravimetric and volumetric analysis. New York Interscience Publishers, Inc. 1948 300 p illus. 24 cm. (Chemical analysis Vol iv) $6.25 1173

Contents: General discussion. Organic compounds as precipitants for inorganic ions. Some properties of organometallic precipitates. Separation by means of organic reagents. Theory of the solubility of salts with common anion. Techniques in gravimetric and volumetric analysis with organic reagents. Special reagents: Anthranilic acid. The arsonic acids. Benzoin oxime. Ammonium nitrosophenylhydroxylamine (cupferron). The oxine (8-hydroxyquinoline) (oxine). Miscellaneous reagents. α-nitroso-β-naphthol. Picrolonic acid. Precipitants for anions. Quinaldic acid. Salicylaldoxime. Tannin. Thionalide. Appendix. Author index. Subject index.

Note: This volume deals essentially with those organic compounds which form insoluble organometallic salts when used for the detection or determination of organic or inorganic substances. The introductory chapters discuss the fundamental principles of organic chemistry as relating to organic reagents, and describe the special techniques employed when using these reagents in gravimetric and volumetric analyses. The remainder and greater part of the volume is devoted to detailed descriptions of various organic precipitants as regards behavior characteristics of the complexes formed, reaction with various ions, types of analyses to which best suited, and finally the actual analytical procedures.

FOULK, CHARLES WILLIAM AND OTHERS

Quantitative chemical analysis an introduction to the science and practice of chemical measurement. By Charles W Foulk, Harvey V Moyer and William M. MacNevin. New York McGraw Hill Book Company Inc., 1952 484 p. illus. 24 cm. $5 75 1174

Contents: Introduction. The chemical balance and its use. Common operations of quantitative analysis. Apparatus for gravimetric analysis. The operations of gravimetric analysis. Calculations in gravimetric analysis. The solubility of analytic precipitates. Analytical precipitates. Volumetric apparatus and its calibration. Volumetric solutions and their standardization. Calculations in volumetric analysis. Hydrogen-ion concentration of aqueous solutions of acids, bases, and salts. Oxidation-reduction reactions in volumetric analysis. Precipitation reactions and complex formation in volumetric analysis. Errors and statistical methods in chemical analysis. Oxidation-reduction potentials. The potentiometric measurement of pH values. Electrometric titrations. Electrolytic analysis. Colorimetric analysis. Exercises. Appendices. Name index. Subject index.

Note: An introductory work for use in college courses. The underlying theory is presented in the first part of the book, and the laboratory exercises are described separately in the latter part. As the table of contents shows, most of the space is given to gravimetric and volumetric methods of analysis, but there is some discussion of instrumental methods. The authors are members of the faculty of Ohio State University

FRIEDEL, ROBERT AUGUSTINE AND MILTON ORCHIN

Ultraviolet spectra of aromatic compounds. New York John Wiley & Sons Inc., 1951 52 p. illus. 27 cm $14.50 1175

Contents: Purpose and scope of the collection. Spectrometric nomenclature and the absorption law for solutions. Instruments and experimental procedure. Theoretical aspects of ultraviolet absorption spectra. The use of ultraviolet spectra in qualitative analysis. Quantitative analysis. Use of the catalogue. Acknowledgment. Collection of spectra. Name index of spectra. Formula index of spectra.

Note: A collection of the ultraviolet spectra of 579 polynuclear aromatic compounds together with some expert discussion of the use of such spectra in chemical analysis. According to the authors, about half of the included spectra have been taken from the published literature, and the other half are original determinations by the authors and other workers in Bureau of Mines laboratories. Graduate chemists interested in the use of ultraviolet absorption spectra in organic analysis are the book as reference tool and as an introduction to ultraviolet spectroscopy

GIBB, THOMAS ROBINSON PIRIE

Optical methods of chemical analysis New York McGraw Hill Book Company Inc., 1942 391 p illus. 23 cm. (International chemical series L. P Hammett consulting editor) $8.00 1176

Contents: Spectrochemical analysis. The spectrophotometer. The colorimeter. Turbidimetry, nephelometry and fluorophotometry. The refractometer. Elementary crystallography. Identification of crystals with the polarizing microscope. The interferometer. The polariscope.

Note. In this contribution to the literature of analytical chemistry the author covers the fundamental theory, the design, and the practical application of the 10 optical instruments which are most widely used in organic and inorganic chemical analysis. Emphasis is placed on the design and technique of modern rapid methods of micro and macro analysis by means of the spectrograph, spectrophotometer, colorimeter and allied instruments, refractometer, microscope, and polariscope.

GILREATH, ESMARCH S

Qualitative analysis using semimicro methods. New York McGraw Hill Book Company Inc., 1954 287 p. illus 24 cm. $4.50. 1177

Contents (abridged) Theoretical aspects. Experimental procedures. Appendix. Index.

Note. An introductory text for college students. In keeping with current ideas on the teaching of qualitative analysis, more space is devoted to exposition of theory than to descriptions of laboratory exercises. Part on theoretical aspects consists of 10 chapters devoted to such principles as forces between atoms, chemical equilibrium and oxidation-reduction theory. If necessary these chapters can be comprehended without reference to the laboratory exercises.

GRIFFIN, CARROLL WARDLAW AND MARY ALYS PLUNKETT

Inorganic semimicro qualitative analysis. New York McGraw Hill Book Company Inc., 1951 299 p illus. 23 cm. $5.00 1178

Contents: Part i, Theory: Atomic structure, valence and types of compounds. Solutions of electrolytes. Chemical equilibrium. Hydrolysis. Heterogeneous equilibrium. Complex ions and amphoterism. Oxidation and reduction—reactions—theory. Part ii, Analytic Laboratory techniques. Preparation of sample. The silver group. The

copper-arsenic group The aluminum-iron group The alkaline earth group. The soluble group. The anions. Appendix. Index. The common logarithms of the natural numbers.

Note A textbook and laboratory manual for college undergraduates who have completed a year of general inorganic chemistry The discussion of theory in Part I is sufficiently inclusive to form a good foundation for more advanced theoretical studies. In Part II the procedures for the various analyses are presented in a convenient form which includes a schematic diagram of the reactions. The authors are members of the Department of Chemistry of Vassar College.

HAMILTON, LEICESTER F , AND STEPHEN G SIMPSON

Quantitative chemical analysis Tenth edition Formerly Talbot's *Quantitative chemical analysis* New York The Macmillan Company, 1952 529 p illus 21 cm $5.25 1179

Contents Part I, Introduction: General considerations. General directions. Common analytical operations. The analytical balance. The precision of analytical measurements. Review of some basic principles. Part II, Volumetric analysis General directions for volumetric work Neutralization methods. Acidimetry and alkalimetry Oxidation-reduction (redox) processes. Oxidation-reduction (redox) titrations. Permanganate process. Dichromate and ceric processes. Iodimetry (iodometry) Precipitation methods ("precipitimetry") Complex formation methods ("complexometry") Part III, Gravimetric analysis: General principles of gravimetric analysis. Analyses of soluble salts. Analysis of an ore. Analysis of a nonferrous alloy Part IV Instrumental methods Potentiometric methods. Conductometric methods. Amperometric methods. Optical methods. Gasvolumetric methods. Part V Miscellaneous determinations. Appendix. Index.

Note A standard introductory text and laboratory manual which has been used in successive editions for 55 years. It is organized so that the student can acquire a full understanding of the chemical theory involved as he learns the details of quantitative analytical techniques. The present edition represents a considerable revision in which the space given to theory has been increased along with other changes. The authors are members of the faculty of Massachusetts Institute of Technology

HAMMETT, LOUIS PLACK

Solutions of electrolytes with particular application to qualitative analysis Second edition New York McGraw Hill Book Company, Inc , 1936 238 p illus 21 cm (International chemical series, J F Norris, consulting editor) $5 00 1180

Contents Part I Principles: Introduction. The solubility product principle. Weak electrolytes the law of chemical equilibrium. The ionization of water Acidity and basicity Hydrolysis. Complex compounds. Oxidation-reduction reactions. Oxidation potentials. Part II, Experiments Introduction. The course of laboratory instruction. Questions on the experiments. The method of analysis. Special notes on the method of analysis. Further analytical methods. Appendixes. The lecture experiments. The schedule of laboratory work. Reagents. Apparatus.

Note A combination text and laboratory manual for college courses in qualitative analytical chemistry This second edition incorporates the new theories of the ionization of acids and bases, the new theories of inorganic colloidal solutions, and other material not in the first edition.

HARLEY, JOHN H , AND STEPHEN E WIBERLEY

Instrumental analysis New York John Wiley & Sons Inc , 1954 440 p illus. 24 cm $6 50 1181

Contents Introduction. Spectral theory Absorption in the visible region. Absorption in the ultraviolet region. Absorption in the infrared region. Raman spectroscopy Fluorometric methods. Apparatus for emission spectroscopy Qualitative emission spectroscopy. Quantitative spectrographic analysis. Flame photometry Colorimetric pH measurement. Electrode potential and pH measurements. Potentiometric titrations. Conductance measurement. Polarography Amperometric titrations. High-frequency methods. X-ray analysis. Mass spectrometry Nuclear-radiation measurements. Laboratory experiments. Appendix. Index.

Note The authors of this college text have recognized that graduate chemists, when they enter analytical or research work in industry will make extensive use of commercially available instruments. Instruments are considered according to their area of use. There [redacted] considerably more emphasis on explaining their basic principles and their potentialities and limitations than on their description. Even so, numerous commercial instruments are described and shown in reproductions of photographs. Footnote references [redacted] the literature appear throughout the book [redacted] addition, a selected bibliography of books and articles for further reading is appended to each chapter

HENLEY, ALFRED, editor

Electrophoresis bibliography Compiled by Charles L. Schuettler Silver Spring Md. Biochemical Instruments Division, American Instrument Company, Inc., 1955 290 p. 28 cm $12 50 1182

Contents Part I, Explanation of classifications. Part II, Arrangement, terms, and symbols. Part III, Classification of papers. Books and general articles. Theory and instrumentation. Moving boundary method. Microscope method. Zone electrophoresis in immobilized media (paper gelatin, etc.) Electrophoresis convection. Interferometry in electrophoresis. Preparative electrophoresis. Diffusion studies. Adsorption chromatography (Schlieren and interferometric methods) Inorganic compounds. Simple organic compounds. Plant physiology and soil science. Animal physiology Human physiology Normal human serum and plasma. Hormones and enzymes. Blood corpuscles. Micro-organisms. Viruses. Human pathology Industrial process control. Index to authors.

Note An extensive, though selected, bibliography of books and articles on electrophoresis and certain related analytical techniques, such as diffusion studies and adsorption chromatography The third and fourth parts occupy all but 12 of the pages, and the third part is the heart of the volume. It is classified as noted in the above Contents. Within each sub-class the arrangement is alphabetical by senior author Each entry gives authors' names, title of the article, title of the journal, volume number page number, year of publication, and a reference to an abstract in *Analytical abstracts* or *Chemical abstracts*, if an abstract in one or the other of these sources was located by the compiler The entries were selected on the basis of their potential usefulness to professional biochemists and biophysicists. Diffusion studies and certain techniques classified as adsorption chromatography were included because they are useful in biochemistry and can be carried out with standard electrophoresis apparatus. On the other hand, the entries on these topics have been rigidly selected, and no attempt was made to cover the whole field of chromatography for example. The total of literature references is approximately 3,200 This 1955 edition is an enlarged version of the original edition published in 1953 The number of entries has been substantially increased. The added entries include both references omitted from the original list and literature published since its compilation.

HERSHENSON, HERBERT M

Ultraviolet and visible absorption spectra, index for 1930–1954 New York Academic Press, Inc., 1956 205 p 29 cm. $12 00 1183

Note This book indexes the absorption spectra for chemical substances that have been published in 27 leading chemical periodicals and in the book, R. A. Friedel and M. Orchin, *Ultraviolet spectra of aromatic compounds*, described above. The arrangement of the index is alphabetical by name of compound. For each spectrum indexed, symbols are used to indicate whether it is for the visible, ultraviolet, or vacuum ultraviolet range of radiation. About 32,000 spectra are indexed. The book is useful to analytical chemists, particularly those using colorimetric techniques of analysis.

HILLEBRAND, W F , AND G E LUNDELL

Applied inorganic analysis with special reference to the analysis of metals, minerals and rocks Second edition *revised by* G E F Lundell, H. A. Bright, and J I Hoffman. New York John Wiley and Sons, Inc., 1953 1 034 p illus. 24 cm $18 50 1184

Contents: Part I, General considerations: Introduction. Balance and weights. Apparatus and reagents. Common operations. Special apparatus and techniques. Volumetric analysis. Part II, The determination of the elements: The hydrogen sulfide group—elements that yield sulfides that are insoluble in acids and in solutions of alkali sulfides—elements that yield sulfides that are insoluble in acids but are soluble in solutions of alkali sulfides—the noble metals: gold, osmium, ruthenium, platinum, palladium, rhodium, iridium. The ammonium sulfide group—elements that form sulfides that are soluble in acids—elements that form hydroxides or basic compounds. The alkaline earths and magnesium. The alkalies. The acid-forming elements. Part III, Silicate rock analysis: Introduction. Methods applicable to silicate rocks. Part IV, Carbonate rock analysis: Introduction. Rational methods for the analysis of carbonate rocks. Condensed analysis. Index of authors. Index of subjects.

Note: This standard work is not a book of special techniques but one devoted to fundamental analytical methods of separations and reactions. It contains descriptions of methods of separation and determination that have proved of value, or that promise to be of value, in applied inorganic analysis. Established procedures are described in full detail, and literature references are furnished. Recent developments in polarography, chromatography, mass spectrometry, fluorometry and the like are discussed with relative brevity since the authors feel that sufficient experience has not been accumulated to present working directions in enough detail. In this edition much new material has been added, and much of the old has been significantly revised. Part [illegible] of the first edition (with lime, glass, bauxite, and refractories analysis) has been entirely omitted. The book is addressed primarily to graduate chemists.

Hogness T R., and Warren C. Johnson

Qualitative analysis and chemical equilibrium. Fourth edition. New York Henry Holt and Company 1954 621 p illus. 21 cm. $5.50. 1185

Contents (abridged): The atomic and molecular concept of matter. Electrolytes and non-electrolytes. Quantized atoms and molecules. Oxidation and reduction. Reaction velocity and chemical equilibrium. Heterogeneous equilibrium—the solubility product—colloids. The ionization of water—hydrolysis. Complex ions. Amphoteric substances. Oxidation-reduction equilibria. Nuclear chemistry. Laboratory techniques. The alkali metal group of ions. The silver group. The copper-arsenic group. The aluminum-zinc group. The alkaline earth group of ions. The preparation of a sample for analysis—analysis of solids. Identification of the negative ions. The chemical properties of negative ions. Appendix. Index.

Note: A standard college text designed for use in first courses in chemical analysis. It pioneered the emphasizing of chemical equilibrium and related theory rather than the learning of analytical techniques, and was also one of the first books to introduce semimicro methods in qualitative analysis. A first edition was published in 1937 and [illegible] third edition in 1947. In this fourth edition, the first part—which is largely devoted to theory—is 340 pages long, in contrast to 195 pages in the second part which is devoted to the classic introductory laboratory techniques of qualitative analysis. Several new chapters have been added on such topics as nuclear chemistry. There are many more figures and more tables. The appendix, which contains lists of apparatus and reagents, notes on mathematical operations, and tables of constants and properties, has also been revised, especially the table of constants. The authors are both members of the faculty of the University of Chicago.

Huntress Ernest Hamlin and Samuel Parsons Mulliken

Identification of pure organic compounds tables of data on selected compounds of order I (compounds of carbon with hydrogen or with hydrogen and oxygen) New York John Wiley & Sons, Inc. 1941 691 p. 23 cm. $12 75 1186

Contents: Introduction. The generic tests of order [illegible]. Aldehydes. Carbohydrates. Acids. Phenols. Esters. Acid anhydrides and lactones. Ketones. Alcohols. Ethers, hydrocarbons, etc. Colored compounds of order [illegible] (suborder II). Tables of melting points of derivatives of compounds of order [illegible]. General index for order [illegible].

Note: Presents in organized and accessible form [illegible] summary of data on [illegible] selected list of organic compounds containing carbon and hydrogen, and oxygen. Selection has been made on the basis of interest, commercial importance, and possible commercial value. Compounds are classified in nine genera on the basis of generic tests, applied in order until one is positive. Assignment to division or section [illegible] genus is made upon the basis of physical properties, including specific gravity and also on occasion by special tests. A new feature is the inclusion of melting-point sequence tables of derivatives.

Jacobs Morris B., and Leopold Scheflan

Chemical analysis of industrial solvents. New York Interscience Publishers Inc. 1953 501 p illus. 24 cm. (Chemical analysis a series of monographs on analytical chemistry and its applications editors Beverly L. Clarke and I M Kolthoff Vol VII) $12 00 1187

Contents: Introduction and sampling. Physical and general methods. Physical chemical methods. Physiological effects of industrial solvents. General methods for the determination of solvent vapors. General methods for the analysis of solvent mixtures. Paraffin and unsaturated aliphatic hydrocarbons and terpenes. Benzene, aromatic and hydrocyclic hydrocarbons. Halogenated hydrocarbons. Alcohols. Glycols, polyhydroxy compounds, and ethers. Acids and esters. Ketones and aldehydes. Nitrogen and sulfur compounds. Index.

Note: A reference book of information pertinent to the analysis of [illegible] wide range of solvents used in industry. Basic and general methods such as sampling techniques, determination of specific gravity, the determination of pH, measurement of color, viscosity, surface tension, etc., are covered in the first six chapters. Specific tests for classes of chemical substances and individual substances are described in the succeeding chapters. For each substance, information is given on physical and chemical properties, and the tests applicable to it are described in detail with explicit descriptions of procedures. Accepted standard requirements in the United States of America, such as the standards of the American Chemical Society for reagents and the requirements of the United States Pharmacopoeia for pharmaceutical preparations, are cited. Literature references are given in the form of footnotes. The subject index is adequate.

Kelsey Erwin Burr and Harold G Dietrich

Fundamentals of semimicro qualitative analysis. Revised edition. New York The Macmillan Company 1951 328 p. illus. 22 cm. $4 90 1188

Contents (abridged): Section I, Fundamental theory. Section II, Analytical procedure. Part I, The systematic cation analysis. Part II, The analysis for the non-metal ions. Part III, The analysis of solids. Appendix. Index.

Note: An introductory text and laboratory manual for college courses. The procedures employ original samples of the order of 0.3 ml. (about ten drops) in which the amounts of the individual ions present average about 1 mg. It has been extensively rewritten in the present edition, and the type has been reset. The authors are members of the faculty of Yale University.

Kirk Paul Leland

Quantitative ultramicroanalysis. New York John Wiley & Sons Inc., 1950 310 p. illus. 23 cm. $6.50 1189

Contents: Introduction. Volumetric apparatus and techniques. Colorimetry apparatus and techniques. General apparatus and techniques. Microgram titrimetry. Metallic constituents: titrimetric methods. Non-metallic constituents: titrimetric methods. Volumetric gas methods. Spectrophotometric methods. Physical methods. Index.

Note: Standard methods require samples of about one milligram or more. In this book [illegible] more refined technique is described, in which quantities as small as one microgram may be used. Apparatus and practical laboratory procedures are both discussed in full detail. There are more than 100 illustrations, most of which pertain to apparatus. The book is intended for graduate students and advanced researchers who are familiar with standard methods.

KOLTHOFF, IZAAK MAURITS

Acid base indicators Translated by Charles Rosenblum New York The Macmillan Company, 1937 414 p illus 22 cm $10 00 1190

Contents The dissociation of strong and weak electrolytes. The reaction (degree of acidity) of acid, bases and salts. Amphoteric substances. The ion activity theory and its application to acid-base equilibria. The Brönsted definition of acidity and basicity properties of acids and bases. The properties of acid-base indicators. The color change and properties of indicators. The influence of solvents on the properties of indicators. The theory of indicators. The colorimetric determination of hydrogen ion concentration. Buffer solutions, preparation and properties. The colorimetric determination of hydrogen ion concentration. Sources of error in the colorimetric method. Indicator papers. Appendix. Index.

Note This manual, originally published in German, was brought up to date by the author for this first edition in English. It is valuable as a handbook and reference for work in analytical chemistry

KOLTHOFF, IZAAK MAURITS, AND H A LAITINEN

*p*H and electro titrations, the colorimetric and potentiometric determination of *p*H Potentiometry, conductometry, and voltammetry (polarography) Outline of electrometric titrations Second enlarged and revised edition New York John Wiley & Sons, Inc, 1941 190 p illus 23 cm $6 00 1191

Contents The colorimetric determination of *p*H—acid-base equilibria. Acids and bases. The reaction of aqueous solutions. Acid-base indicators. The colorimetric measurement of *p*H. The potentiometric measurement of *p*H—potentiometric titrations Electrode potentials. The technique of potentiometric measurements. The potentiometric measurement of the hydrogen ion activity Potentiometric titrations. Conductometric titrations Conductometric titrations. Voltammetry (polarography) and amperometric titrations The fundamental principles of voltammetry Equipment and technique used in voltammetry Amperometric titrations. Index.

Note Workers in pure and applied chemistry as well as those in the allied fields of biochemistry physiological chemistry bacteriology and pharmacy find this book useful. It contains a condensed outline of the measurement of *p*H according to the colorimetric and potentiometric method and of the performance of potentiometric and conductometric titrations. A general understanding of physical chemistry and electrochemistry is basic to the study of this book. Considerable new material was added to the second edition. Three new chapters have been included, forming Part IV on voltammetry and amperometric titrations. A list of reactions which have been made the basis of conductometric titrations, with literature references, has been added.

KOLTHOFF, I M AND JAMES J LINGANE

Polarography Second edition New York Interscience Publishers Inc. 1952 2 v illus 23 cm Vol I $11 00 vol II $12 50 1192

Contents (abridged) Volume I, Theoretical principles—instrumentation and technique Part I, Theoretical principles Theory of diffusion currents. Evaluation of diffusion coefficients. Polarography in nonaqueous media. Electrical migration current. The electrocapillary curve of mercury Polarographic maxima. Polarographic waves of complex metal ions. Polarographic waves of organic substances. Part II, Instrumentation and technique The dropping mercury electrode and polarographic cells. Common operations in polarographic analysis. Voltammetry with solid microelectrodes. Volume II Inorganic polarography Inorganic polarography Organic polarography Biological applications of polarography Amperometric titrations. Author index, Volumes I–II. Subject index, Volumes I–II.

Note A professional-level treatise based on a systematic review of the international literature. Basic theory instruments, techniques, and applications are covered with unusual thoroughness. The characteristics of polarographic current voltage curves are treated at length. Although much among the material is drawn from the international literature, the authors have themselves made important contributions to the development of the field. The first edition in one volume was published in 1941 the second edition represents a very extensive revision and expansion of the original work.

KOLTHOFF, IZAAK MAURITS, AND E B SANDELL

Textbook of quantitative inorganic analysis. Third edition. New York The Macmillan Company, 1952 759 p illus. 24 cm. $6.50 1193

Contents (abridged) Stoichiometry Gravimetric analysis Theoretical part, practical part, gravimetric determinations. Volumetric analysis. Theoretical part, practical part, volumetric determinations. Physical and physicochemical methods of analysis. Analyses of complex materials. Appendix. Index.

Note A successful college textbook and laboratory guide. The expositions of theory and the descriptions of apparatus and laboratory procedures are fuller and somewhat more advanced than in some introductory texts in this field. Literature references are included. The second edition appeared in 1943 Fairly extensive revisions were made in preparing this edition.

KOLTHOFF, IZAAK MAURITS, AND V A. STENGER

Volumetric analysis Second revised edition New York Interscience Publishers, Inc., 1942–47 2 v 23 cm. Vol I, $7 50, vol. II, $8 25 1194

Contents Volume I, Theoretical fundamentals Fundamentals of volumetric analysis. The principles of neutralization and ion combination reactions. Titration curves for neutralization and ion combination reactions. The principles of oxidation-reduction reactions—titration curves. Indicators. Titration error Reaction velocity catalysis and induced reactions. Adsorptions and coprecipitation phenomena. Volumetric methods of organic analysis. Methods for the determination of the equivalence-point. Appendix. Indexes. Volume II, Titration methods Apparatus and general principles. Calibration and use of volumetric apparatus. Practical principles of volumetric analysis. Acid-base reactions Acidimetry and alkalimetry Acid-base reactions. Acidimetry and alkalimetry Acid-base reactions. Acid-base displacement titrations. Titrations involving hydrolytic precipitation or complex formation. Special methods of acidimetry and alkalimetry Quantitative precipitation and complex-formation reactions. Argentometric titrations. Other precipitation methods. Formation of slightly dissociated or complex compounds—mercurimetry Appendix. Author index. Subject index.

Note Although this work had its origin in a German monograph, *Die Praxis der Massanalyse*, it has been revised and expanded so much in the *English translation that it is essentially a new work*. It presents a liberal selection of useful tests, discusses procedures and reagents in general, and gives references to the pertinent literature. The techniques covered are those in which the reagent is added in an amount which is chemically equivalent to the substance being determined. The treatment is at a professional and graduate level. In the first edition of the English translation, oxidation and reduction reactions were covered in the second volume. When the revision was made for the second edition, these were removed, and it was planned that they would be the subject of a third volume. However Volume III had not been published at the end of 1956.

MCALPINE ROY K, AND BYRON A SOULE

Fundamentals of qualitative chemical analysis semimicro method Fourth edition. *Princeton D Van Nostrand Company* Inc., 1956 340 p illus. 23 cm. $5 00. 1195

Contents Introduction Formulas and equations Chemical arithmetic. Introduction to laboratory work. Group I—lead, silver mercury *Copper division of group II*—mercury lead, bismuth, copper cadmium. Group III—iron, chromium, aluminum. Group IV—zinc, manganese cobalt, nickel. Group V—barium, strontium, calcium. Group VI—magnesium, sodium, potassium, ammonium radical. *Arsenic division of group II*—arsenic, antimony tin The more common acid radicals. Other common acid radicals. Qualitative examination of simple dry unknowns. Complex dry unknowns. *Appendix*. Logarithms. *Index*.

Note A standard introductory text. It covers, in an elementary style, basic principles, gives directions for the separation and

identification of common metal and acid radicals, and describes analytical methods for qualitative analysis. The first edition was published in 1916 and the third edition in 1949. The most significant change in this fourth edition is the conversion of the procedures to the semimicro scale. Numerous other changes of pedagogical interest are described in the book's preface.

McDonald, Hugh J

Ionography electrophoresis in stabilized media. In collaboration with Robert J Lappe, Edward P Marbach, Robert H. Spitzer and Matthew C. Urbin. Chicago The Year Book Publishers, Inc., 1955 268 p. illus. 23 cm. $6.50 1196

Contents: Historical introduction. Types of apparatus and nomenclature. General experimental methods and procedures. Mobility determinations and related factors. Relation between mobilities in stabilized and non-stabilized media. Proteins, peptides and amino acids. Carbohydrates and related compounds. Lipoproteins and related substances. Enzymes, hormones and vitamins. Inorganic substances. Miscellaneous applications of ionographic techniques. Bibliography. Subject index. Author index.

Note: A survey in the form of monograph of relatively new technique in chemical analysis which has gone under various names including, in addition to the one used for the title of this book, "paper electrophoresis," "ionophoresis," and "electrochromatography." The technique depends upon the phenomenon of migration in an electric field of charged particles, either ions or colloidally dispersed substances, through conducting solutions stabilized with such materials as powders, silica gel, glass fiber or filter paper. Essentially the book is literature survey and references to the literature are incorporated in the text and keyed to bibliography of nearly 800 citations. The whole field is surveyed, including historical development, apparatus, nomenclature, experimental methods, and applications to the analysis of various classes of chemical substances. As the chapter titles indicate, most applications developed are in the field of biochemistry, medicine, and pharmaceutical research. The book is addressed to graduate biochemists and other scientists who are concerned with research in the proteins and other substances of high molecular weight.

Meites Louis

Polarographic techniques. With a foreword by I. M. Kolthoff New York Interscience Publishers, Inc., 1955 317 p. illus. 24 cm. $6.00 1197

Contents: The nature and scope of polarographic measurements. Instrumentation. The polarographic limiting current. Theory of the current-voltage curve. The interpretation of half-wave potential data. Maxima and their suppression. Techniques of quantitative polarographic analysis. Amperometric titrations. Special techniques. Literature cited. Appendixes. Trouble-shooting in polarographic circuits. Half-wave potentials and diffusion current constants of inorganic substances. Index.

Note: Polarography is now solidly established as an analytical method in chemical laboratories, and polarographs are offered by number of commercial instrument makers. The books about it published hitherto have been in the nature of comprehensive treatises, or at the opposite extreme, very brief expositions. In contrast this book is systematic introduction to theory and practice, written at level that suits advanced students of chemistry and chemistry graduates who will use polarography as tool. In addition to an treatment of the basic theory and typical apparatus, it includes directions for some laboratory experiments. A feature of special reference value is 44-page table, arranged by chemical elements, of half-wave potentials and diffusion current constants. Values in this table have been taken from the literature, and references are given to the sources.

Mellon Melvin Guy editor

Analytical absorption spectroscopy, absorptimetry and colorimetry New York John Wiley & Sons Inc., 1950. 617 p. illus. 23 cm. $12.50. 1198

Contents: Chemistry. Preparation of systems for absorptiometric measurement, by M. L. Moss. Physics: General principles of absorptiometric measurement, by M. G. Mellon. Color comparimeters, by W. R. Fortune. Filter photometers, by R. H. Müller. Spectrophotometers—ultraviolet and visible regions, by K. S. Gibson. Photographic methods, by R. R. Holiday. Applications of ultra-violet and visual spectrophotometric data, by E. I. Stearns. Spectrophotometers—infrared region, by L. J. Brady. Measurement and specification of color, by D. B. Judd. Index.

Note: The principles and techniques of absorption spectroscopy as an analytical tool are presented in this important contribution to the literature of analytical chemistry. Each chapter is in effect short monograph by specialist, and is accompanied by bibliography of the pertinent literature. Although available instruments are described, more attention is paid to their operating principles and the techniques of their use. The book is intended for professional chemists. It is of some interest to physicists as well.

Mellon Melvin Guy

Quantitative analysis methods of separation and measurement. New York Thomas Y Crowell Company 1955 694 p illus. 24 cm. $6.50 1199

Contents (abridged): Part I, General principles: Introduction. A, The sample: Selection and preparation. Measurement by weight. Measurement by volume. Preliminary treatment. B, The desired constituent. The general problem of separation. Separation by volatilization processes—by precipitation processes—by electro-chemical processes—by partition processes. Titrimetry general principles. Neutralization methods. Oxidation-reduction methods. Precipitation and complexation methods. Gravimetry. Colorimetry. Electrometry. Part II, Laboratory exercises with analytical technics. Managing laboratory work. Experimental data. The use of balances. The use of volumetric ware. Neutralization methods. Oxidation-reduction methods. Precipitation and complexation methods. Gravimetric methods. Colorimetric methods. Electrometric methods. Library problems. Part III, Numerical analytical problems: Typical problems and their solution. Appendix. Index.

Note: A textbook for introductory college courses. The experience of the author who is *Professor of Analytical Chemistry at Purdue University* has led him to regard all problems of quantitative analysis as having two phases the first, chiefly or entirely chemical, involves treatment of the sample separation of the desired constituent, and conversion of that constituent (or its chemical equivalent) into measurable form; the second phase entirely physical, involves measurement of the desired constituent (or its chemical equivalent). This sequence of operations is followed in the organization of the textbook. The methods presented, suitable to both inorganic and organic chemistry, are sufficiently general to include all elements of the Periodic Table.

Mitchell John, Jr., and Donald Milton Smith

Aquametry application of the Karl Fischer reagent to quantitative analyses involving water New York Interscience Publishers Inc. 1948 444 p illus. 24 cm. (Chemical analysis, a series of monographs on analytical chemistry and its applications B L. Clarke and I. M Kolthoff editors. Vol v) $10.50 1200

Contents: Part one, Specific quantitative determination of water by Karl Fischer reagent—reactions of inorganic compounds: Methods for determination of water. Titrimetric determination of water using Karl Fischer reagent. Nature of the Karl Fischer reagent. Titrimetric procedures for using Karl Fischer reagent. Determination of water in organic compounds. Determination of water in commercial organic materials. Determination of water in inorganic compounds. Reactions of Karl Fischer reagent with inorganic compounds. Part II, Organic reactions involving liberation or consumption of water—application of Karl Fischer reagent to quantitative determination of organic functional groups: Determination of alcoholic hydroxyl. Determination of organic carboxylic acids. Determination of acid anhydrides. Determination of carbonyl compounds. Determination of amines and nitriles. Determination of peroxides. Miscellaneous analytical procedures. Proposed further studies involving Karl Fischer reagent. Author index. Subject index.

Note: Since its discovery in 1935 the Karl Fischer reagent has become highly useful in determinations of moisture content for many organic and inorganic compounds and reactions. The authors of this volume describe their own wide experience with this modern analytical reagent and critically survey the rapidly increasing literature on the subject up to early 1947. For easy duplication in the

KOLTHOFF, IZAAK MAURITS
Acid base indicators Translated by Charles Rosenblum New York The Macmillan Company, 1937 414 p illus 22 cm $10 00 1190

Contents The dissociation of strong and weak electrolytes The reaction (degree of acidity) of acid, bases and salts. Amphoteric substances. The ion activity theory and its application to acid base equilibria. The Brönsted definition of acidity and basicity properties of acids and bases. The properties of acid-base indicators The color change and properties of indicators. The influence of solvents on the properties of indicators. The theory of indicators. The colorimetric determination of hydrogen ion concentration: Buffer solutions, preparation and properties. The colorimetric determination of hydrogen ion concentration Sources of error in the colorimetric method. Indicator papers. Appendix. Index.

Note This manual, originally published in German, was brought up to date by the author for this first edition in English It is valuable as a handbook and reference for work in analytical chemistry

—— Volume III. Editorial board John Mitchell, Jr., I. M. Kolthoff E. S. Proskauer A. Weissberger New York Interscience Publishers Inc., 1956. 546 p. illus. 23 cm. $11.50 1208

Contents: Determination of organic acids, by J. Mitchell, Jr., and others. Determination of acid anhydrides, by C. W. [illegible] Determination of [illegible] and [illegible], by [illegible], Jr., and C. A. [illegible]. Determination of aldehyde [illegible], by A. [illegible] and J. L. [illegible]. Analytical [illegible] spectrometry by V. R. [illegible]. Synthetic organic coating resins, by O. D. [illegible]. Subject index, Volumes I–III.

Note: The three volumes, as noted above, have been published in this continuing series by the end of the year 1956. The purpose of the series is to publish from time to time review or monographic surveys on methods of analysis for functional groups in organic compounds. Each of the monographs is [illegible] substantial work based on the literature and including an extensive bibliography. The series is addressed to graduate chemists. There is no special emphasis on [illegible] particular area or group of organic chemistry; rather the whole field of organic analysis, both academic and industrial, is within the series' scope.

PATTERSON ANDREW JR., AND HENRY C THOMAS

A textbook of quantitative analysis. New York Henry Holt and Company 1952 500 p. illus. 22 cm. $4.75 1209

Contents: The principles of analytical chemistry—stoichiometry. Volumetric methods—titrations with permanganate. Volumetric determinations of acids and bases. Precipitation and complex-formation titrations. Oxidation-reduction reactions and oxidimetric determinations. Procedures used in gravimetric analysis. Preparation and properties of precipitates. Chemical analysis. Some physical methods of chemical analysis. Index.

Note: A substantial introductory text in which the capacity for learning to think in terms of [illegible] and equivalents, understanding the bases of quantitative analytical techniques, and learning the techniques of careful measurement are stressed. Directions for [illegible] number of laboratory exercises in quantitative determinations are incorporated throughout the book. However, much less space is given to such exercises than in some introductory texts in this subject. The authors are both associate professors of chemistry in Yale University.

PIERCE, WILLIS CONWAY AND EDWARD LAUTH HAENISCH

Quantitative analysis. Third edition. New York John Wiley & Sons Inc., 1948. 520 p. illus. 24 cm. $5.00 1210

Contents (abridged): Part I, Fundamentals: The analytical balance and its use. Precision, errors, and significant figures. Preparation of the sample for analysis. Part II, Volumetric analysis: Methods and apparatus. Theory of neutralization reactions. Complex equilibria. Oxidation-reduction. Volumetric precipitation methods. Part III, Gravimetric analysis: Methods and operations. [illegible] to precipitation reactions. Gravimetric analysis of simple [illegible]. Part IV, Special methods: Analysis by electrodeposition. Electrometric titrations. Use of analytical literature—standard samples. Appendix: Mathematical operations. Equilibrium constants. Preparation of reference solutions. Index.

Note: A standard textbook, the first edition of which was published in 1937 and the second edition in 1940. It is designed for use in introductory courses in quantitative chemical analysis, and [illegible] to that [illegible] may be used in either short courses or full-length courses. Basic theory, general techniques, and laboratory procedures for specific analyses are all stressed. In comparison to the second edition, the third edition was very extensively revised. One new chapter was added, and the number of problems increased by nearly 50 per cent.

RANDALL, HARRISON MCALLISTER, AND OTHERS

Infrared determination of organic structures. By H. M. Randall, R. G Fowler Nelson Fuson and J R. Dangl. Princeton D Van Nostrand Company, Inc., 1949 239 p. illus. 29 cm. $12 75 1211

Contents. The application of infrared spectroscopy to chemical analysis. Interpretation of specific structure groups and methods for recognition of these groups. A catalogue of empirical structural assignments for the double-bond region. A structural assignment catalogue for theoretically analyzed molecules. Application of the infrared method in practice. Instruments and experimental techniques. Spectra of various compounds. Index.

Note: This book is both an introduction to infrared spectroscopy and a reference book of data useful in the determination of molecular structures of organic compounds by infrared spectroscopy. The first two chapters are introductory to the subject; the third and fourth chapters consist primarily of tables pertaining to the assignment of the structures of organic compounds on the basis of their infrared spectra. The fourth chapter, the longest one in the book, contains, in addition to several tables, 314 plates of reproductions of the infrared spectra of individual organic compounds.

RIEMAN WILLIAM III AND OTHERS

Quantitative analysis a theoretical approach. Third edition. By William Rieman III, Jacob D Neuss, and Barnet Naiman. New York McGraw Hill Book Company Inc., 1951 523 p illus 24 cm. (International chemical series Louis P Hammett, consulting editor) $6.25 1212

Contents (abridged): Common apparatus and operations. Fundamentals of volumetric analysis. Potentiometric measurements. Titration of salts, acids, and bases. Acidimetry and alkalimetry. Theory of oxidation. Determination of iron in an ore. Iodimetry. Gravimetric determination of chlorides. Coprecipitation. Determination of chlorine. Determination of sulfur. Determination of [illegible]. Photometric methods. Determination of phosphorus. Organic reagents—determination of nickel and aluminum. Analysis of brass or bronze—electroanalysis. Ion exchange—determination of [illegible]. Appendix. References. Reagents and chemicals. Name index. Subject index.

Note: An established textbook for use in introductory college courses. An important feature is the interweaving of theory and laboratory analytical procedures. Other special features are the chapter on coprecipitation, the use of redox potentials, and the treatment of basic constants as functions of ionic strength. The chapter on ion exchange has been newly added in this ed. but the descriptions of certain techniques are considerably more detailed. The chapter on colorimetric methods has been enlarged, and there are minor changes in other parts of the text. The list of references has been revised.

ROSIN JOSEPH

Reagent chemicals and standards with methods of testing and assaying them also the preparation and standardization of volumetric solutions and extensive tables of equivalents. Third edition. Princeton D Van Nostrand Company Inc., 1955 561 p. 24 cm. $10.00 1213

Contents: Explanatory notes. Solutions used in reagents. Standard solutions (for controls, etc.). Reagents. Reagent solutions or [illegible]. The arsenic test. Boiling point range and boiling temperature. Freezing point determination. Melting point or temperature determination. Nitrogen determination by Kjeldahl method. pH determination. Buffer solutions. Indicators for pH determination. Specific rotation. Water determination by Karl Fischer method. Water determination with acetyl chloride. Volumetric solutions. Primary standards. Preparation and standardization of volumetric solutions. Indicators for volumetric determinations. Equivalents of volumetric solutions. Index.

Note: In its third edition, this standard reference book for analytical chemists is unchanged in purpose and organization, but it has been enlarged by the addition of descriptions of 43 new reagents and solvents, such as [illegible], [illegible] and [illegible]. Also, many of the test methods for purity of reagents presented in earlier editions have been revised. The supplementary reference information at the end of the volume has also been extended.

laboratory all procedures involving the reagent are discussed in detail. Documentation is in the form of footnotes. The book is mainly for research chemists and graduate students.

MULLER, OTTO HEINRICH

The polarographic method of analysis Second edition Easton, Pa. Chemical Education Publishing Company, 1951 209 p illus. 21 cm. (Contributions to chemical education No 2) $3 50 1201

Contents Introduction and review of electro-analytical methods. Apparatus. Fundamentals of quantitative analysis. Fundamentals of qualitative analysis. Polarometry Recent developments. Applications. Suggestions for practical polarography Appendix. General polarographic references. List of experiments. Index.

Note A short but reliable introduction to an important instrumental technique in chemical analysis. The technique is compared with other methods based on electric current. Typical apparatus is described, and applications and limitations are discussed. Embodied in the text are directions for 24 laboratory experiments. The first edition appeared in 1941 and consisted of reprints of a series of five articles that had appeared in the *Journal of chemical education*. The work has been extensively revised in this edition.

MULLEN, PAUL W

Modern gas analysis New York Interscience Publishers, Inc., 1955 354 p illus 19 cm $5 50 1202

Contents Part one Absorptiometric gas analysis Introduction. Pressure-volume-temperature relationship of gases. The measurement of pressure-volume-temperature parameters. Sampling. Macro absorptiometric equipment. Absorption reagents. Combustion analysis. Trace micro, and gas volumetric methods of analysis. Errors. Part II, Instrumental gas analysis. Sonic velocity Paramagnetic susceptibility Refractive index and interferometry Thermal conductivity Mass spectrometry Density specific gravity viscosity and effusion. Condensation and distillation. Spectrophotometric methods. Miscellaneous instrumental methods. Bibliography Index.

Note A compact manual of basic science, methods, and instruments pertinent to the chemical analysis of gases and mixtures of gases. The first part covers traditional methods which are based upon absorption. The second part covers newer methods based upon various physical properties. The book is addressed to graduate analytical chemists. As a survey of the present state of the field it should serve such readers well. A classified bibliography is included for the guidance of chemists who need detailed information on specific methods.

NACHTRIEB, NORMAN HARRY

Principles and practice of spectrochemical analysis New York McGraw Hill Book Company, Inc. 1950 324 p illus. 23 cm. $7 00 1203

Contents (abridged) Part I, The principles of spectrochemical analysis. The role of spectroscopy in analytical chemistry Prism spectrographs and the refraction of light. The diffraction of light by slits and gratings. The photographic process. The evaluation of photometric data. Direct-reading spectrometers. The origin of spectra. Part II, The practice of spectrochemical analysis The excitation of spectra. The quantitative analysis of metals. Qualitative analysis. The analysis of refractory materials. The analysis of solutions and soluble salts. Chemical separations in spectrochemical analysis. Index.

Note. A practical and rather thorough text for advanced college students and professional chemists who are just beginning to use spectrochemical analysis. The emphasis is on principles, but standard apparatus and its elements are adequately described. The basic physical principles and the chief instruments are discussed in the first part. The second part serves to introduce the reader to practical use of the techniques of spectrochemical analysis. Auxiliary techniques, such as precipitation of impurities, extraction by solvents, fire assay and electrolytic concentration, which are useful in association with spectrochemical methods, are briefly outlined in the final chapter The scope of the work is limited to emission spectroscopy in the ultraviolet and visual ranges.

OELKE, WILLIAM C

Semimicro qualitative analysis Boston D C. Heath and Company, 1950 377 p illus. 22 cm $4 50 1204

Contents (abridged) Part I, General theory: The solubility of solids. Acids, bases, and salts. Polyionic acids and bases and hydrolysis. Oxidation and reduction. Complex compounds. Part II, Laboratory and applied theory Semimicro technique. Anion analysis. Cation analysis. Systematic analysis. Appendixes. Reference and refresher section. Data section. Index.

Note An introductory textbook designed for study by students who have completed a college course in general chemistry It contains both material for classroom instruction and directions for laboratory work. The author is Chairman of the Department of Chemistry of Grinnell College.

OLSON, AXEL R , AND OTHERS

Introductory quantitative chemistry By Axel R. Olson, Charles W Koch and George C. Pimentel San Francisco W H. Freeman and Company, 1956 470 p illus 25 cm. $5 00 1205

Contents Introduction. The analytical balance. Introductory laboratory operations. Fundamental calculations. Evaluation of quantitative data. Equilibrium and equilibrium constants. Solubility equilibria in precipitation methods. Physical character and purity of precipitates. Gravimetric techniques. Introduction to the principles of volumetric analysis. Titrations and equilibria in monobasic acid systems. Titrations and equilibria in polybasic acid systems. Volumetric techniques. Principles of oxidation-reduction reactions. Analysis of mixtures. Oxidation-reduction methods—separations. Physicochemical methods—colorimetry Applications of physicochemical methods. Appendices. Table of logarithms. Index.

Note. In this textbook for full-length courses, the learning of fundamental principles and basic techniques is emphasized. To point up the emphasis, the directions for laboratory experiments are separated from the discussions of basic matters. In order to adapt the book to the instruction of students preparing for further study in fields other than chemistry particularly the biological and medical sciences, material has been included on buffer solutions, polybasic acids, etc. The book is written in a brisk style that lightens the task of reading and is illustrated with distinctive functional drawings. It is based upon but does not supersede *Introductory quantitative analysis* by Axel R. Olson and others, published in 1948 by the same publisher and used in shorter courses.

ORGANIC ANALYSIS Volume I. Editorial board John Mitchell, jr , I M Kolthoff E S Proskauer, and A Weissberger New York Interscience Publishers Inc., 1953 473 p. illus. 23 cm $8 50 1206

Contents Determination of hydroxyl groups, by V C. Mehlenbacher Determination of alkoxyl groups, by A. Elek. Determination of the alpha-epoxy group, by J L. Jungnickel and others. Organometallic compounds for the determination of active hydrogen, by G. F Wright. Diazomethane for the determination of active hydrogen, by F G. Arndt. Determination of carbonyl compounds, by J Mitchell, jr Determination of acetals, by J. Mitchell, jr Determination of organic sulfur groups, by S. Dal Nogare. Spectroscopic functional group analysis in the petroleum industry by N D. Coggeshall. Subject index.

—— Volume II Editorial board John Mitchell, jr , I M Kolthoff, E S Proskauer, A. Weissberger New York Interscience Publishers Inc. 1954 372 p. illus 23 cm. $8.50 1207

Contents Microdetermination of carboxyl groups (neutralization equivalent) by A. Steyermark. Determination of esters, by R. T Hall and W E. Shaefer Determination of nitro, nitroso, and nitrate groups, by W W Becker and W E. Shaefer Applications of lithium aluminum hydride to organic analysis, by T Higuchi. Coulometric methods, by W D Cooke. Application of polarography to organic analysis, by P J Elving. Methods based on reaction rate by T S. Lee. Phase solubility analysis, by W J Mader Countercurrent distribution, by J R. Weisiger Subject index, Volumes I–II.

compounds. Miscellaneous procedures. Quantitative separation of components in mixtures. Some physical chemical methods applicable to quantitative analysis. Techniques and reasoning in developing new analytical methods or modifying existing methods. The role of quantitative functional group determination in the identification of organic compounds. Weighing of volatile or corrosive liquids. Index.

Note: As indicated in the title, this is a book of analytical methods for organic compounds based on determination of functional groups rather than elements. The author is Research Analyst on the staff of the General Aniline & Film Corporation, and the book is addressed to analytical chemists in other industrial laboratories, as well as to advanced students. Some literature references are included but, generally speaking, procedures are described in sufficient detail to enable the experienced analytical chemist to carry them out without reference to other literature. The first edition appeared in 1948. In this second edition, there are two new chapters, "Techniques and reasoning in developing new analytical methods or modifying existing methods" and "The role of quantitative functional group determination in the identification of organic compounds." In other chapters, recently developed procedures and some older procedures not included in the first edition have been added. The length of the book has been substantially increased.

SMITH ORSINO C

Inorganic chromatography Princeton D Van Nostrand Company Inc. 1953 134 p. illus. 24 cm. $6.00 1219

Contents: Part I, History and theory: Introduction. The work of Tswett. Inorganic chromatography. Column chromatography. Paper chromatography. Chromatography by ion exchange. Radioactive tracers in chromatography. Part II, Applications: Adsorbents. Laboratory procedures. Table of reagents. Bibliography. General index.

Note: Chromatographic methods of chemical analysis have reached the stage of development where they can be used in many fields of chemistry. Nevertheless, most of the books published on the subject to date have been written at the level of specialists in chromatography. This book is the result of a planned effort to make chromatographic procedures available to ordinary chemists, particularly to chemists who are concerned with the analysis of ores and other mixtures of metals. The first part consists largely of literature abstracts, in which the author describes rather specifically and in fair detail methods which have been reported in the literature. References to the source articles are given. In the second part, practical laboratory procedures based on the processing of an 0.1 gram sample are specifically described. The illustrations include five colored plates.

SNELL, FOSTER DEE, AND CORNELIA T SNELL

Colorimetric methods of analysis including some turbidimetric and nephelometric methods. Volume I. Third edition. Princeton D Van Nostrand Company Inc., 1948 239 p. illus. 23 cm. $6.50 1220

Contents (abridged): Volume I, Theory—Instruments—pH: Theory. Comparison with a series of liquid standards. Comparison with solid standards. Dilution and duplication methods. Balancing method. Spectrophotometry. Visual filter photometry. Photoelectric filter photometry. Nephelometry. Turbidimetry. Fluorometry. Calculations. Hydrogen-ion. Author index. Subject index.

—— Volume II. Third edition. Princeton D Van Nostrand Company Inc., 1949 916 p. illus. 23 cm. $15.00 1221

Contents: Volume II: Inorganic. Lead. Thallium. Silver. Mercury. Copper. Cadmium. Bismuth. Arsenic. Antimony. Tin. Indium. Gallium. Germanium. Aluminum. Beryllium. Chromium. Iron. Nickel. Cobalt. Manganese. Zinc. Titanium. Zirconium. Vanadium. Tungsten. Molybdenum. Uranium. Columbium. Tantalum. Gold. Platinum. Rhenium. Iridium. Palladium. Osmium. Rhodium. Ruthenium. Sodium. Lithium. Cesium. Calcium. Barium. Cerium. Lanthanum. Magnesium. Phosphorus. Silica. Boron. Chlorine and chloramine. Chloride. Chlorates and perchlorates. Bromide. Iodine and iodine compounds. Fluoride. Sulfide. Sulfur in various oxidized forms. Selenium and tellurium. Thiocyanates. Nitrate. Nitrites. Ammonia. Carbon. Carbon monoxide. Carbon dioxide and carbonates. Cyanide. Oxygen. Peroxides. Ozone. Author index. Subject index.

—— Volume III. Third edition. Princeton D Van Nostrand Company Inc., 1949 950 p illus. 23 cm. $12.50. 1222

Contents: Organic—I Hydrocarbons. Alcohols and their esters. Phenols. Quinones. Oxygen cyclic oxides, and peroxides. Pentoses. Hexoses and heptoses. Polysaccharides. Glucosides. Aldehydes. Ketones. Unsubstituted monobasic aliphatic acids and their esters. Substituted monobasic aliphatic acids and their esters. Polybasic aliphatic acids and their esters. Cyclic acids and their esters. Complex acids and derivatives. Sulfur derivatives. Halogen compounds. Author index. Subject index.

—— Volume IV Third edition. Princeton D Van Nostrand Company Inc. 1954 676 p. illus. 23 cm. $12.50 1223

Contents: Organic—II Nitriles, nitrates, and nitro compounds. Aliphatic amines and amides. Amino acids. Proteins. Aromatic primary, secondary and tertiary amines. Azo compounds, nitrogen-containing cycles, etc. Urea and related compounds. Compounds with inorganic radicals. Sterols. Hormones. Alkaloids. Enzymes. Antibiotics. Glycosides and related compounds. Natural pigments. Color of liquids. Author index. Subject index.

Note: The standard reference work on colorimetric methods of analysis. Volume I is devoted to the basic theory, the instruments used, and to hydrogen ion determination. The other volumes consist of detailed procedures for individual analyses. Although the descriptions of the procedures are complete, literature references are given. The first edition was published in 1921 and the second edition was published in 1936–37. This third edition represents a very extensive revision, in which a majority of the procedures are not to be found in the preceding edition.

SNELL FOSTER DEE, AND FRANK M BIFFEN

Commercial methods of analysis. With photomicrographs by George Lord. New York McGraw Hill Book Company Inc. 1944 753 p. illus. 21 cm (International chemical series L. P Hammett consulting editor) $11.00. 1224

Contents: General. Tools of the analyst. General procedures. Preliminaries to the analysis. Qualitative analysis by micro and spot tests. Hydrogen-ion determination and electrometric titrations. Halogens. Combined nitrogen. Sulfur and its compounds. Minerals. Water analysis. Fixed alkalies and alkaline salts. Cement and mortar. Ferrous metals. Aluminum and light aluminum alloys. Copper-base alloys. Saponifiable fats and oils. Sulfated oil and related products. Soap and soap products. Heavy-metal soaps. Lubricating greases. Waxy substances. Solvents and thinners. Alcohols. Paints, varnishes, lacquers, and resins. Synthetic resins. White pigments, extenders, and mineral fillers. Mixed white pigments, extenders, and mineral fillers. Colored pigments and mineral colors. Oil and wax emulsions. Rubber. Miscellaneous rubber analyses and synthetic elastomers. Analysis of coal. Gas analysis. Paper, paper fibers, textile fibers, and starches. Sugar and sugar products. Petroleum products. Pyrethrins and rotenone. Indicator reagents, and volumetric solutions. Index.

Note: A treatise for chemists outlining the method of approach to analysis of the numerous complex commercial products. Standard methods, such as those recommended by the American Society for Testing Materials and the Association of Official Agricultural Chemists, have in many cases been introduced, though not often in the exact words of the original methods. Simplification and explanation of steps, together with reasons, are features of the work. Emphasis is laid on the importance of the determination of minute quantities. The volume is of use to the professional analyst as well as to the student who is familiar with the tools of quantitative analysis.

STEIN WILLIAM H. AND OTHERS

Amino acid analysis of proteins New York The New York Academy of Sciences 1946 184 p illus. 23 cm. (New York Academy of Sciences. Annals. Vol. 47 p. 57–240, 1946) $2.25 1225

SANDELL, ERNEST BIRGER

Colorimetric determination of traces of metals. Second edition, revised and enlarged New York Interscience Publishers, Inc, 1950 673 p illus 23 cm (Chemical analysis, a series of monographs on analytical chemistry and its applications, editors, Beverly L Clarke and I M Kolthoff Vol III) $10 50 1214

Contents General part, Colorimetric trace analysis Trace analysis. Methods for the separation and isolation of traces of substances. Colorimetry and spectrophotometry in trace analysis. General colorimetric reagents. Special part, Procedures for the determination of traces of metals *Aluminum*. Antimony Arsenic. Barium. Beryllium. Bismuth. Cadmium. Calcium. Cerium. Chromium. Cobalt. Columbium and tantalum. Copper Gallium. Germanium. Gold. Indium Iridium. Iron. Lead. Lithium. Magnesium. Manganese. Mercury Molybdenum. Nickel. Osmium. Palladium. Platinum. Potassium. The rare earth elements. Rhenium. Rhodium. Ruthenium. Scandium. Silver Sodium. Thallium. Tin. Titanium. Tungsten. Uranium. Vanadium. Zinc. Zirconium. Appendix. Author index. Subject index.

Note This volume presents a collection of modern methods for the colorimetric determination of traces of elements, especially of metals. Described under the names of the elements chosen are a limited number of methods which in the author's experience have proved best for dealing with traces of the respective elements. The book is addressed to graduate chemists. The second edition is one-third again as large as the original edition. Many new procedures are described.

SCHAEFFER, HAROLD F

Microscopy for chemists Princeton D Van Nostrand Company, Inc, *1953* 264 p illus 23 cm $4 50 1215

Contents Principles governing lenses. Getting acquainted with the microscope. Properties of objective and oculars. Illumination—equipment and principles. Permanent records—preparation of sketches and photomicrographs. Quantitative microscopy Polarized light—principles, sources, and applications. Chemical procedures on a microscopic scale—general—inorganic reactions—organic reactions. Laboratory experiments. Bibliography Index.

Note This manual of the microscope and its uses in chemistry is organized so that it may be used as a textbook by matriculated students or as a self-instruction manual and reference book by professional chemists. It introduces the reader to the principles and general construction of modern optical microscopes It discusses objectives, oculars, illumination, etc., with adequate thoroughness, and finally presents chemical techniques based on the optical microscope. The expository chapters are supplemented by 32 experiments designed to be carried out in chemical laboratory The book is self-contained from the viewpoint of the average chemist. However the author has included an extensive bibliography of books and papers for the guidance of those who need more specialized information. The illustrations include pictures of instruments and their parts and also reproductions of number of microphotographs of chemical substances.

SCOTT WILFRED WELDAY, editor

Standard methods of chemical analysis, a manual of analytical methods and general reference for the analytical chemist and for the advanced student. Fifth edition edited by N Howell Furman in collaboration with eminent specialists Princeton D Van Nostrand Company Inc 1939 2 v illus (part col d) 24 cm. $30 00 1216

Contents (abridged) Volume I Aluminum. Antimony Arsenic. Barium. Beryllium. Bismuth. Boron. Bromine. Cadmium. Calcium. Carbon Cerium and the other rare earths. Chlorine. Chromium. Cobalt. Columbium and tantalum. Copper Fluorine. Gallium. Germanium. Gold. Hydrogen. Indium. Iodine Iron. Lead. Magnesium. Manganese. Mercury Molybdenum. Nickel. Nitrogen. Oxygen. Phosphorus. Platinum metals. Radium Rhenium. Scandium. Selenium and tellurium. Silicon. Silver The fire assay for gold and silver Sodium and the other alkali metals. Strontium. Sulfur Thallium. Thorium. Tin. Titanium. Tungsten. Uranium. Vanadium. Zinc. Zirconium and hafnium. Qualitative tests of substances. Solubility table. Index. Volume II Standard methods of sampling. Decomposition of the sample. Determination of moisture, water of crystallization Bituminous substances including asphalts, tars, and pitches. Cement. Coal and coke. Explosives. Fixed oils, fats and waxes. Petroleum oils, fats and waxes. Paints. Paper and paper-making materials. Poisons. Rubber gutta percha and balata. Gas analysis. Methods of analysis of soaps and soap products. Water analysis. Microscopical and bacteriological examination of water supply Miscellaneous analyses. Acidimetry and alkalimetry Determination of *p*H by the colorimetric method. Electrometric hydrogen ion measurement. Potentiometric methods. Conductometric methods. Gas analysis. Chemical microscopy Quantitative microchemical analysis. Metallography Methods for the determination of solubility Spectrographic analysis. Index.

Note For many years this work has been a standard reference manual of chemical analysis in industrial and commercial laboratories. It gives in detail the methods used in the quantitative analysis of the chemical compounds of all the elements, including the rare ones, and it applies these methods to the analysis of ores, minerals, alloys, cements, soaps, and many other materials used or produced in the chemical industries. These methods are widely used in the United States in preparing contract specifications for the purchase or sale of materials in quantity This edition has been revised and enlarged and includes methods for the newer industrial products, and detailed descriptions of newer techniques in quantitative analysis, such as the electrometric, potentiometric conductometric, and microchemical methods. There are separate author and subject indexes in each volume.

SHRINER, RALPH L, AND OTHERS

The systematic identification of organic compounds a laboratory manual By Ralph L Shriner, Reynold C Fuson and David Y Curtin Fourth edition New York John Wiley & Sons, Inc., *1956* 426 p illus. *22* cm. $6 00 1217

Content Introduction. The identification of unknowns. Preliminary examination. The determination of physical properties. Qualitative analysis for the elements. The solubility classes. Application of classification tests. The use of spectroscopic methods for functional group determination. The preparation for derivatives. Tables of derivatives. The separation of mixtures. Introduction to the solution of structural problems. Problems. Appendix. Index.

Note An introductory textbook which has been widely used in American colleges and universities since the publication of the first edition in 1935 The subject is the qualitative analysis of organic compounds. The authors stress the necessity for *systematic* and logical thinking in the identification of organic "unknowns. On the other hand, they point out that organic analysis is intrinsically more than the mere following of directions and that the student must in most cases of identification use considerable ingenuity Except for spectroscopic techniques, instrumental analytical techniques are not discussed. All other methods covered require only the standard equipment of college teaching laboratories and the standard literature. Background discussion and directions for experiments and analytical procedures are *intermingled* throughout the book, and literature references are inserted adjacent to the text to which they pertain. The third edition was published in 1948. Revisions including citations of the recent literature are to be found in most chapters of this fourth edition. Major changes include abandonment of scheme of analysis based on solubility behavior and further emphasis on critical checking, by control reactions and otherwise of the results of laboratory work.

SIGGIA, SIDNEY

Quantitative organic analysis via functional groups. Second edition New York John Wiley & Sons, Inc., *1954* 227 p *illus 22* cm $5 25 1218

Contents Hydroxyl groups. Carbonyl groups. Carboxylic acids, salts, esters, amides, imides, anhydrides, and chlorides. Alkoxyl groups. Acetyl groups. Unsaturation. Active hydrogen compounds and compounds which react with Grignard reagent. Acetylenic hydrogen. Determination of acetal and ketal type compounds and vinyl alkyl ethers. Amino groups. Quaternary ammonium salts. Hydrazines. Diazonium salts. Titanous chloride reduction. Mercapto groups. Dialkyl sulfides. Alkyl disulfides. Sulfonic acids, salts, and sulfonamides. Peroxides. Isocyanates and *isothiocyanates*. Vinyl ethers. Oxirane oxygen (epoxide compounds) Water in organic

WALTON, HAROLD FREDERIC

Principles & methods of chemical analysis. New York Prentice-Hall, Inc., 1952 435 p. illus. 22 cm. $7.00. 1230

Contents: Introduction. The physical properties of precipitates. Impurities in precipitates. The drying and ignition of precipitates. Electrolytic methods of analysis. Organic precipitants. Complex ions in analytical chemistry. Ion exchange methods in analytical chemistry. Separation by vaporization and extraction. Volumetric analysis—introduction. Oxidation-reduction potentials. Methods of potentiometric titration. Acid-base titrations. Acid-base indicators. Oxidation-reduction titrations. Volumetric oxidation-reduction methods in organic chemistry. Oxidation-reduction indicators. Precipitation titrations. Complex-forming titrations. Conductometric titrations. Appendixes: Bibliography of selected texts. Selected methods for determination of the elements. Tables of data. Answers to problems. Index.

Note: An advanced survey in which the emphasis is on basic concepts. However, there are also many details and special points derived from experience which will be helpful to analytical chemists. The book is valuable also for the discussion of special problems in analysis, for example, the titration of fluoride. Instrumental methods of analysis are not covered, but much of the material presented is basic to the intelligent use of analytical instruments. Abundant literature references are supplied in footnotes and in the second appendix. The latter feature makes the book a useful reference tool for graduate chemists.

WELCHER, FRANK JOHNSON

Organic analytical reagents. Princeton D Van Nostrand Company Inc., 1947–48 4 v illus. 24 cm. $10.25 per vol. set, $38.50. 1231

Contents: Volume I: The electronic theory of valence. Coordination compounds. Chelate compounds. Types of chelate rings. The effect of structure on solubility. Hydrocarbons. Substitution products of hydrocarbons. Alcohols. Phenols. Miscellaneous phenolic compounds. Amino phenols. Phenol sulphonic acids. 8-hydroxyquinoline and its derivatives. Azo derivatives of 8-hydroxyquinoline. Ethers. Aldehydes. Ketones. Index of names and synonyms of organic reagents. Index of the uses of organic reagents. Volume II: The organic acids. Halogen substituted acids. Hydroxy acids. Amino acids. Miscellaneous acids. Acyl halides. Acid anhydrides. Esters. The amines. Quaternary ammonium compounds. Index of names and synonyms of organic reagents. Index of the uses of organic reagents. Volume III: Part I, Heterocyclic nitrogen compounds: Pyridine and its derivatives. Quinoline and quinoline derivatives. Dipyridyl and related compounds. Pyrazolone derivatives. Miscellaneous heterocyclic nitrogen compounds. Part II, The amides. The diamines. Acyclic amines. Hydroxyamines. Derivatives of Glyoxime. Imidoxime compounds. Nitroso phenols. Miscellaneous oximes. Cupferron and neocupferron. Nitroso amines. Part III, Acidic amino compounds. Rhodanine and its derivatives. Carbazides, thiocarbazides, and semicarbazides. Carbazones. Thiocarbazones. Miscellaneous amino compounds. Index of names and synonyms of organic reagents. Index of the uses of organic reagents. Volume IV: Acidic nitro compounds. The arsonic acids. The dithiocarbamates. The xanthates. Miscellaneous sulfur compounds. Sulfonic acids. The carboxylic acids. Selenious acids. The thiols. Diazonium compounds. Carbohydrates. Miscellaneous natural substances. Miscellaneous compounds. Lake-forming dyestuffs. Hydroxyanthraquinone dyes. Miscellaneous dyes. Dyes used in the detection of anions. Index of names and synonyms of organic reagents. Index of the uses of organic reagents.

Note: Totaling 2,219 pages in four volumes this major work is designed as a reference manual of all organic analytical reagents that have been described in the chemical literature published prior to January 1, 1946. Methods of preparation and uses of the reagent compounds are explained in sufficient detail for laboratory needs, and in addition citations are given to the original literature sources. Each volume contains an index to names and synonyms of organic reagents and an index of the uses of organic reagents. The latter feature brings together, under the name of a substance, the names of all organic reagents that have been reported as usable for its detection.

WELCHER, FRANK J., AND RICHARD B HAHN

Semimicro qualitative analysis. Princeton. D Van Nostrand Company Inc., 1955 497 p. illus. (part col'd) 23 cm. $8.00. 1231A

Contents (abridged): Part I, Theoretical. The structure of the atom. The formation of ions and molecules. The relationship of chemical structure and properties. Crystals, liquids, and gases. Chemical reactions. Solutions. Colloids. Chemical equilibrium. Ionic equilibrium. The solubility product principle. Amphoteric substances. Theory of oxidation-reduction. Part II, Reference. Ionization constants, solubility products, and other tables. Properties of inorganic compounds. Mathematical operations. Cations. Anions. Part III, Experimental. Appendix. Index.

Note: A modern introductory text and laboratory manual whose contents have been selected and organization planned to suit them to the way qualitative analysis is now taught in many colleges and universities in the United States of America. The structure of the atom is introduced in the first chapter; furthermore, it is treated in terms of wave mechanics rather than the Rutherford-Bohr theory. The book is more than a laboratory manual. In fact, the laboratory work is somewhat subordinated to the discussion of theory. The space in the volume is divided as follows: Part I, 128 pages, part II, 122 pages; part III, 143 pages.

WILG, EDWIN O., AND OTHERS

Semimicro qualitative analysis a course in applied chemical equilibrium. By Edwin O Wilg, Willard R. Line, and John F Flagg. Princeton D Van Nostrand Company, Inc., 1954 238 p. illus. 23 cm. $4.25 1232

Contents (abridged): Theory: Introduction. Structure of matter. Solutions. Chemical equilibrium. Applications of the law of chemical equilibrium—homogeneous systems—heterogeneous processes. Hydrolysis. Complex ions and amphoterism. Valence and oxidation-reduction. Experimental: The technique of semimicro qualitative analysis. Cation analysis. Anion analysis. Summary of analysis of general unknowns for cations and anions. General questions. Special alloy procedures. Appendix: Terms and definitions. Review of mathematical operations. List of apparatus. Reagents used in semimicro qualitative analysis. Tables. Index.

Note: This book may be viewed as a revised edition of, or as successor to one of the same title written by John F. Flagg and Willard R. Line and published in New York in 1941. Although intended for the instruction of college students taking their first course in chemical analysis—as was the earlier work—it has been reorganized and extensively rewritten in comparison to the earlier work. It teaches the principles of chemical equilibrium and applies them systematically to the analysis of inorganic substances. It covers both the basic theory and laboratory analytical procedures. It provides a range of basic reference information such as a list of reagents, ionization and instability constants, and a table of solubility data.

WILLARD, HOBART H., AND OTHERS

Elements of quantitative analysis theory and practice. By Hobart H. Willard, N Howell Furman, and Clark E. Bricker Fourth edition. Princeton D Van Nostrand Company Inc., 1956 576 p. illus 23 cm. $5.85 1233

Contents: Part I, Introductory material—general operations: Introduction. The general operations of quantitative analysis. The analytical balance—weighing—calibration of weights. Volumetric measurements. Fundamental laws and theories. Part II, Titrimetric (volumetric) methods: The general principles of titration methods. Titrimetric precipitations. Complex-forming titrations. Titrations of acids or bases—Procedures. The theory of acid-base titrations. Oxidation-reduction reactions. Oxidations with standard potassium permanganate solutions—ceric solutions—potassium dichromate solution. Oxidation and reduction processes involving iodine. Oxidation-reduction. Part III, Gravimetric determinations: Gravimetric analysis. Simple gravimetric determinations. Part IV, Separations: Separation by precipitation. Gravimetric separations. Electrolytic separations and determinations. Electrolytic determinations and separations—analysis of alloys—procedures. Separations by extraction. Separation by adsorption—by volatilization. Colorimetry and spectrophotometry. An introduction to electrometric methods in analytical chemistry. Appendixes. Subject index. Author index.

Note: This college textbook has enjoyed wide use in college courses in the United States of America and elsewhere. The first edition was published in 1933 and the third edition in 1940. These editions were written by Willard and Furman and were entitled Elementary quantitative analysis. In this fourth edition, matters basic to the whole field of quantitative analysis are discussed in

Contents Introduction, by W. H. Stein. The contribution of the analytical chemist to protein chemistry, by H. B. Vickery. The use of specific precipitants in the amino acid analysis of proteins, by W. H. Stein and S. Moore. The isotope dilution method of amino acid analysis, by D. Shemin and G. L. Foster. Chromatographic and ion exchange methods of amino acid analysis, by R. K. Cannan. Microbiological methods in amino acid analysis, by E. E. Snell. Enzymatic methods in amino acid analysis, by R. M. Archibald. Amino acid composition of simple proteins, by E. Brand. Some correlations between physico-chemical data and the amino acid composition of simple proteins, by J. T. Edsall. Conclusion, by H. T. Clarke.

Note A collection of papers presented at a conference held in October 1943 under the auspices of the New York Academy of Sciences. The volume as a whole offers a review and critical evaluation by chemists, biologists, and medical scientists of the various methods used to determine the amino acids produced by the hydrolysis of proteins. Of particular interest is the description of an apparently complete analysis of a simple protein. Brief bibliographies are included.

STEYERMARK, AL

Quantitative organic microanalysis New York McGraw-Hill Book Company, Inc. 1951 389 p illus 23 cm $7.50 1226

Contents (abridged) Weighing on the microchemical balance. Preparation of samples for analysis. The determination of metals by the ashing technic. Determination of nitrogen by the micro-Dumas method. The microdetermination of carbon and hydrogen. Standard solutions. Microdetermination of nitrogen by the Kjeldahl method. Determination of sulfur. Determination of halogens. Determination of phosphorus. Determination of arsenic. Determination of oxygen. Determination of the neutralization equivalent (determination of acidic hydrogen, carboxyl groups). Determination of alkoxyl groups (methoxyl and ethoxyl). Determination of acetyl groups. Determinations carried out on the Van Slyke manometric apparatus. Manometric carbon determination. Manometric determination of primary amino nitrogen in aliphatic α-amino acids. Determination of molecular weight. Determination of some physical constants. Calculations. Author index. Subject index.

Note The author of this work is Head of the Microchemical Department of Hoffmann-La Roche, Inc., Nutley, New Jersey. The order in which the chapters are presented is the same order in which microchemical techniques and procedures have been taught over a period of eight years to new members of his department. The publication is accordingly for the beginning microanalyst who is a graduate in chemistry. It is also of interest to experienced microanalysts. The methods and equipment are described in detail; in some cases alternative methods are also given. The bibliographical citations at the ends of the chapters are extensive.

SWANSON, HOWARD E., AND OTHERS

Standard X-ray diffraction powder patterns Washington, D. C. Government Printing Office 1953–56 6 v illus 26 cm. (United States National Bureau of Standards. Circular 539 Vols 1–6) Vols 1–5 $0.45 vol 6 $0.40 1227

Contents Volume I, Data for 54 inorganic substances, by H. E. Swanson and E. Tatge. Introduction. Patterns. References. Cumulative index to Volumes I and II. Volume II, Data for 30 inorganic substances, by H. E. Swanson and R. K. Fuyat. Introduction. X-ray data. Elements. Sulfides. Oxides. Halides. Carbonates. Sulfates. Silicates. Cumulative index to Volumes I and II. Volume III, Data for 34 inorganic substances, by H. E. Swanson and others. Introduction. X-ray data. Elements. Selenides. Oxides. Oxide hydrates. Multiple oxides. Halides. Chlorates. Carbonates. Nitrates. Sulfates and sulfites. Phosphates. Bromodimates. Cumulative index to Volumes I, II, III. Volume IV, Data for 42 inorganic substances, by H. E. Swanson and others. Introduction. Elements. Sulfides. Oxides. Halides and halide hydrates. Nitrates and nitrites. Phosphates. Sulfates. Silicates. Intermetallic compounds. Cumulative index for Volumes I–IV. Volume V, Data for 45 inorganic substances, by H. E. Swanson and others. Introduction. Standard X-ray powder patterns. Cumulative index to Volumes I–V. Volume VI, Data for 44 inorganic substances, by H. E. Swanson and others. Introduction. Standard X-ray powder patterns. Cumulative index to Volumes I–VI.

Note This circular, of which six parts have been issued, prints tables of standard X-ray diffraction powder patterns for inorganic chemicals. Most of the patterns are presented in revision and evaluation of corresponding patterns of the American Society for Testing Materials card file published in 1939 (with supplement 1944). Patterns also are included for some compounds not represented in that file. The project of compilation is supported by the Joint Committee on Chemical Analysis by Powder Diffraction Methods, a committee composed of members from the following bodies: The American Society for Testing Materials, the American Crystallographic Association, and the British Institute of Physics.

SWIFT, ERNEST H

A system of chemical analysis (qualitative and semi-quantitative) for the common elements San Francisco W. H. Freeman and Company, 1955 589 p illus. 24 cm $6.00. 1228

Contents (abridged) Part I, The preparation of standard solutions. The analytical balance. The determination of the sensitivity of a balance. The calibration of a set of weights. Volumetric methods of analysis. The preparation of a standard silver nitrate solution. The preparation and standardization of a thiocyanate solution. The preparation of a permanganate solution. The preparation and standardization of ferrous sulfate solutions. The preparation of iodine solutions. The preparation of starch solution. The preparation of thiosulfate solutions. The applications of iodometric methods. The preparation of carbonate-free solutions of sodium hydroxide. The standardization of sodium hydroxide solutions. The preparation and standardization of hydrochloric acid solutions. Gravimetric methods of analysis. The gravimetric standardization of a hydrochloric acid solution. Part II, The system of analysis for the basic constituents. The preparation of the sample, preliminary observations, and preparation of the solution for the analysis. Separation of the basic constituents into groups. Precipitation of the hydrogen sulfide group and separation of the copper and tin groups. The analysis of the copper group. Analysis of the tin group. Precipitation of the ammonium sulfide group, separation of iron, removal of phosphate, and separation of the aluminum and zinc groups. The analysis of the zinc group. The analysis of the aluminum group. The analysis of the alkaline earth group. The analysis of the alkali group. Part III, The system of analysis for the acidic constituents. The analysis of the acidic constituents. The analysis for sulfide, cyanide, and sulfite. The analysis for ferrocyanide and ferricyanide. The analysis of the halide group. The analysis of the oxy-halogen group. The analysis of the phosphate group. The detection and estimation of sulfate and of fluoride. The analysis of the sodium carbonate solution for nitrate, nitrite, borate, and acetate. Appendix. Questions and problems. Tables. Reagents and chemicals. Equipment. Index.

Note Presented in this textbook is a systematic combination of qualitative and quantitative analysis into a uniform system of chemical analysis. Many of the methods were original with the author and were developed for this system. The material was tested at the California Institute of Technology before publication. Detailed directions are given for procedures, and there are fairly lengthy discussions of each procedure. The book was originally published in 1939 by another publisher. The edition listed here is a reprint issued in 1955 of the original edition.

WAGNER, WALTER, AND OTHERS

Advanced analytical chemistry By Walter Wagner, Clarence J. Hull and Gerald E. Markle. New York Reinhold Publishing Corporation 1956 282 p illus 24 cm. $6.00 1229

Contents (abridged) Part I, Analytical techniques. Organic reagents. Gas analysis. Colorimetry and spectrophotometry. Polarography and amperometric titrations. Chromatography and ion exchange techniques. Thermogravimetric analysis. Radiochemistry. Statistics. Part II, The analytical chemistry of the elements. Index.

Note An advanced-level text and laboratory manual of some potential interest to graduate chemists as well as to enrolled students. In the first part—which accounts for a little over one-third of the book's length—selected instrumental techniques are briefly described, and references are given to the more important literature pertaining to them. Also in this part are useful survey chapters on organic reagents and on the use of statistics in analytical chemistry. The second part is devoted to analytical procedures for specific elements and groups of elements. Selected procedures are described in detail; however, these descriptions are embedded in condensed critical appraisals of all the analytical procedures applicable to the element or group of elements under discussion. A useful feature of this second part is the inclusion of fairly extensive literature lists for the various procedures. The authors are members of the faculty of the University of Detroit.

tion on the subject is collected and critically evaluated, with special emphasis on the data published in the *International critical tables*. Copious tables of data, gathered by many observers, accompany the discussions.

EITEL, WILHELM

The physical chemistry of the silicates. Chicago University of Chicago Press 1954 1,592 p. illus. 25 cm. (The University of Chicago committee on publications in the physical sciences Walter Bartky and others) $45.00 1240

Contents: The states of the silicates: The crystalline state. Fused and glassy states. Colloids. Fusion and polymorphic equilibria in dry silicate systems: General remarks on fusion and polymorphism phenomena. Special silicate systems. Pneumatogenic and hydatogenic silicates: Silicate systems with volatile components. Silicate hydrates of the zeolite, permutite group. Solid-state reactions and their ceramic uses: Reactions in the solid state. Reactions in ceramic bodies. Reactions in hydraulic cements. Silicate melts as industrial glasses and slags: Reactions in glass making—industrial glasses, enamels, and glazes. Industrial slags. Key to international periodicals in silicate research. References. Subject index. Index to minerals and rock species. Systematic index of the special silicate melt equilibria. Alphabetical index of silicate and related systems. Index of chemical compounds. Author index.

Note. The first and second editions of this important treatise were written in German and were published in Leipzig in 1929 and 1941. This third edition is not [illegible] translation of [illegible] published German edition, but was first published in English in the United States of America under the imprint noted above. It is [illegible] cyclopedic survey of theory and phenomena of the chemical behavior of silicate materials. It is based on the world literature, and most of the chapters are essentially an organization of abstracts of published papers and other literature. The source articles are cited in footnotes throughout the book, and the names of their authors have been assembled in the 44-page author index. Industrial applications are covered to the extent that papers reporting experiments in the production of such products as bricks, and papers reporting theoretical studies made in connection with industrial production are abstracted. The book is logically arranged and cross-indexed for reference use. In comparison to the preceding edition, it is much broader in scope and, of course, covers the later literature.

HURD, DALLAS T

An introduction to the chemistry of the hydrides. New York John Wiley & Sons Inc., 1952 231 p. illus. 24 cm. $8.25 1241

Contents: Introduction to the hydrides. Chemical bonding and the structure of hydrides. The saline hydrides—general considerations. The hydrides of the alkali metals. The hydrides of the alkaline earth metals. The hydrides of beryllium and magnesium. The covalent hydrides—general considerations. The hydrides of the group III elements. The hydrides of the group IV elements. The hydrides of the group [illegible] elements. The hydrides of the group VI elements. The hydrides of the group VII elements—F, Cl, Br, I. Acids and bases. Complex hydrides. The hydrides of the transitional elements. The borderline hydrides. Nomenclature of the hydrides. Appendixes: Deuterides. Toxicology of the hydrides. The vacuum manipulation of volatile compounds. Sources of hydrides. Extended tables of physical properties and thermodynamic data for the boron hydrides. Author index. Subject index.

Note. The author has used the term "hydride" to designate binary compounds which contain one other element and hydrogen, and also to designate certain compounds which are complex derivatives of binary hydrides. Most of the book consists of compact essays on specific hydrides, organized according to the following formula: [illegible] tabulated statement of chemical and physical properties, [illegible] discussion of the structure, descriptions of methods of laboratory preparation, [illegible] discussion of properties, [illegible] statement on uses, and literature references. Frequent variations from this formula are found: for instance, safety precautions in handling are described for the hazardous compounds. The book is of interest both to chemists engaged in pure research and to those concerned with applications, since industrial uses are frequently mentioned in the paragraphs on uses of the individual compounds.

INORGANIC SYNTHESES. Volume I. Editor in-chief Harold Simmons Booth. Associate editors L. F Audrieth and others New York McGraw Hill Book Company Inc., 1939 197 p. illus. 23 cm. $6.00 1242

Contents (abridged): Purification of lithium carbonate. Purification of silver residues. Sodium amalgam. Barium amalgam. Analyses of [illegible], [illegible], and cerium. Red mercuric oxide. Boron tribromide. Potassium fluoborate. Anhydrous rare-earth chlorides. Carbon tetrafluoride. Trisilane salts. Silicobromoform (tribromosilane). The higher chlorides of silicon. Lead tetraacetate. Anhydrous zirconium bromide. Nitrosyl chloride. Monochloramine. Dibromamide. Nitrogen trichloride. Nitramide. Hydrogen azide. Hydroxylamine. Hydrazine sulfate. Guanidine nitrate. Crystalline orthophosphoric acid. Antimony [illegible]. Oxygen fluoride. Thionyl bromide. Selenium dioxide. Sulfur, selenium, and tellurium hexafluorides. Chromyl chloride. Silicomolybdic acid. Silicotungstic acid. Phosphotungstic acid. Anhydrous hydrogen fluoride. Hydrogen bromide. Hydriodic acid. Iodine monochloride. Iodine trichloride. Periodic acid. Metallic rhenium. Rhenium trichloride. Tetrapyridine-ferrous chloride (yellow salt). A laboratory [illegible]. Subject index. Index of contributors.

—— Volume II. Editor in-chief W Conard Fernelius. Associate editors L. F Audrieth and others Consultant on nomenclature and indexing, Janet D Scott. New York McGraw Hill Book Company Inc., 1946 293 p. illus. 23 cm. $6.00 1243

Contents (abridged): Copper (I) chloride. Recovery of silver and iodine from silver iodide residues. Metal derivatives of 1,3-diketones. Fluoboric acid. Ammonium tetrafluoborate. The rare earth elements and their compounds. The separation of cerium from rare earth mixtures. Fractional crystallization—the magnesium rare earth nitrates. Monosodium acetylide (ethynylsodium). Ammonium carbamate. Alkali metal cyanates. Silica gel. Germanium (II) iodide. Titanium(IV) bromide. Nitric oxide [nitrogen (II) oxide]. Ammonium azide. Phosphonium iodide. Ammonium [illegible]. Sulfides and polysulfides of the alkali metals. Salts of dithionic acid. Sulfamic acid. Potassium [illegible]. Chromium (III) oxide gel. Potassium monochlorochromate. Trisodium orthoperiodate (sodium paraperiodate). Potassium hexacyanomanganate (III). [illegible](III) salts. Potassium hexacyanocobaltate (III). The metal carbonyls. Platinum(IV) chloride. Appendix: The nomenclature of inorganic compounds. Index of contributors. Subject index.

—— Volume III. Editor-in-chief Ludwig F Audrieth. Associate editors John C. Bailar jr., and others. Consultant on nomenclature and indexing, Janet D Scott. Advisory Board Arthur A. Blanchard and others. New York McGraw Hill Book Company Inc., 1950 230 p illus. 23 cm. $5.00 1244

Contents (abridged): Sodium peroxide 8-hydrate. Basic beryllium derivatives of organic acids. Strontium sulfide and selenide phosphors. Barium thiocyanate. Boron chloride and bromide. Aluminum bromide. Carbon tetraiodide. Cyanamide. Dicyanodiamide (cyanoguanidine). Ammonium dithiocarbamate. Organosilicon compounds. Dimethyldichlorosilane (dimethylsilicon dichloride). [illegible]. Diphenylsilanediol. Germanium( ) iodide (germanium diiodide). The extraction of hafnium and zirconium from cyrtolite. Nitrogen(V) oxide (nitrogen pentoxide, dinitrogen pentoxide, nitric anhydride). Hydroxylammonium salts. Pyrophosphoric acid (diphosphoric acid). Sodium pyrophosphates (sodium diphosphates). Sodium triphosphate (sodium tripolyphosphate). Sodium [illegible]. Sodium monofluophosphate. Silver monofluophosphate. Hexafluophosphates of sodium, ammonium, and potassium. Ammonium metavanadate. Sulfur(VI) fluoride (sulfur hexafluoride). Disulfur pentoxydichloride (pyrosulfuryl chloride). Selenium(IV) oxide (selenium dioxide). Selenium(IV) oxychloride. Crystalline selenic acid. Tellurium(IV) chloride (tellurium tetrachloride). Tellurium (IV) oxide (tellurium dioxide). Telluric acid. [illegible] (III) [illegible]. Chromium hexacarbonyl. Uranium(IV) oxalate. Anhydrous metal fluorides. Rhenium(VI) oxide (rhenium trioxide). Rhenium(VII) oxide (dirhenium heptoxide). Anhydrous iron(III) chloride (ferric chloride). Hexamminenickel(II) bromide and hexamminenickel(II) iodide. Index of contributors. Subject index. Formula index.

the first part. The two parts that follow are devoted to the traditional methods of quantitative analysis as taught in introductory college courses. In each of these parts, there is a preliminary chapters on general matters, and this is followed by chapters on individual methods. These chapters consist largely of directions for analytical procedures, but each includes also some background discussion and a wide selection of review questions and problems. Specialized techniques, including techniques based on instruments, are introduced in the final chapters of the fourth part. In comparison to the third edition the scope and purpose are the same but there has been extensive revision of the book's content and some enlargement. There are several new chapters as well as revised parts of chapters carried over. There are many more review questions and problems than in the third edition.

WILLARD, HOBART HURD, AND OTHERS

Instrumental methods of analysis By Hobart H. Willard, Lynne L Merritt, jr, and John A Dean. Second edition Princeton D Van Nostrand Company, Inc, 1951 344 p illus 29 cm $5 75 1234

Contents Visual colorimeters. Fundamental laws of colorimetry Photoelectric colorimeters and fluorescence meters. Turbidimeters and nephelometers. Spectrophotometry and flame photometry Spectrography X-ray diffraction methods. Radioactivity The refractometer and interferometer. Polarimetry Thermal conductivity and other methods for the analysis of gases. Mass spectrometry The centrifuge. Determination of the pH of a solution. Potentiometric titration methods. Conductance methods. Electroanalysis. Polarography Amperometric titration methods. Miscellaneous methods. Chromatographic analysis. Appendix. Index.

Note An introductory textbook designed primarily for use in college courses offered to advanced undergraduate students. Each class of instrument is described as to purpose, method of operation, advantages and disadvantages in practical chemical analysis. However the book is not a handbook on all commercially available instruments. The first edition appeared in 1948. About 100 pages have been added in the present edition. Chapters carried over have been revised and extended, and the chapters on polarimetry miscellaneous methods, and chromatographic analysis have been added.

INORGANIC CHEMISTRY

AUDRIETH, LUDWIG FREDERICK, AND BETTY ACKERSON OGG

The chemistry of hydrazine New York John Wiley & Sons, Inc. 1951 244 p 22 cm. $7 00 1235

Contents: Hydrazine as a hydronitrogen and an ammono compound. Formation and preparation of hydrazine. Preparation of concentrated and anhydrous hydrazine. Properties of anhydrous hydrazine. Properties of aqueous solutions of hydrazine. Oxidation of hydrazine catalytic decomposition. Quantitative determination and qualitative identification of hydrazine. Hydrazine salts. Coordination compounds of hydrazine. Anhydrous hydrazine as solvent. The hydrazine system of compounds. Uses of hydrazine and its compounds. Index.

Note A monograph in which the knowledge of hydrazine, N_2H_4, published down to about 1949 has been organized and summarized. References are given to the literature, including patents. Most of the book is written from the viewpoint of theoretical and research chemists, but the chapter on uses is slanted for industrial chemists. The book was originally prepared as an Office of Naval Research report, and revisions and additions were made for this edition.

BOOTH, HAROLD SIMMONS, AND DONALD RAY MARTIN

Boron trifluoride and its derivatives New York John Wiley & Sons 1949 315 p illus 22 cm $10 00 1236

Contents History and preparation of boron trifluoride. Physical properties. Chemical properties of boron trifluoride. The coordinating power of boron trifluoride Fluoboric acids and their salts. Boron trifluoride and its derivatives as catalysts. Analysis of boron trifluoride and its derivatives. Practical handling of boron trifluoride. References. Author index. Subject index. Formula index.

Note Boron trifluoride has been known for more than a century but it is only in the last decade and a half that its usefulness in chemical research and in industrial chemistry has been widely recognized. This book is probably the first comprehensive treatment of the compound and its derivatives. Essentially it is a digest of the extensive periodical and patent literature. The literature itself is cited in a bibliography which runs to almost 1,000 references. The book is of potential value to applied chemists in a number of fields, such as petroleum chemistry ceramics, electroplating, and plastics, as well as to chemists engaged in fundamental research.

BROWN, LAWRENCE M, AND OTHERS

Bibliography of research on deuterium and tritium compounds 1945 to 1952, by Lawrence M Brown, Abraham S Friedman and Charles W Beckett. Washington, D C. Government Printing Office, 1956 85 p 26 cm. (United States National Bureau of Standards Circular 562) $0 50 1237

Contents Introduction. Principal topics and subject code. Bibliography and author index. Subject index. Compound index.

Note. A bibliography of 1 482 references to published research on the properties of deuterium and tritium compounds, intended especially for the use of chemists and physicists engaged in research on the hydrogen isotopes. The main arrangement of the bibliography is alphabetical by author's name. The arrangement and the methods of coding and indexing used in the *Bibliography of research on heavy hydrogen compounds*, by Kimball, Urey and Kirshenbaum, were followed. The authors estimate that 95 per cent of the references were obtained from *Chemical abstracts* for the years 1946 to 1953 inclusive, the remaining 5 per cent from *British abstracts* and *Physics abstracts* for the same years.

DIEKE, GERHARD HEINRICH, AND A. B F DUNCAN

Spectroscopic properties of uranium compounds New York McGraw Hill Book Company, Inc., 1949 290 p illus 24 cm (National nuclear energy series Manhattan Project technical section Division III—Volume 2) $4.25 1238

Contents Part I, Spectroscopic properties of uranium compounds. Experimental procedure. X-ray analysis of the crystal structure of uranyl compounds. General features of the fluorescence and absorption spectra of uranyl compounds. Fluorescence spectra of uranyl compounds. Absorption spectra of uranyl compounds. Intensity measurements. Miscellaneous observations. Miscellaneous uranium compounds. Part II, The preparation of uranium compounds Synthesis of uranyl compounds. Preparation of other uranium compounds. Problems in synthesis. Growth of crystals. Conclusions and suggestions. Appendixes: Tables of wavelength measurements. Special preparations and apparatus. Miscellaneous contributions to the chemistry of uranium. Bibliography Index.

Note. Presented in this volume are the results of a comprehensive study carried out largely at Columbia University under the auspices of the Manhattan Project. Pertinent results from the literature are included and correlated. Experimental techniques—some of them new—used in the work are described. The study not only advanced the understanding of the uranyl compounds but also produced fundamental knowledge pertinent to the understanding of the solid state.

DORSEY, NOAH ERNEST

Properties of ordinary water-substance in all its phases water vapor, water, and all the ices. New York Reinhold Publishing Corporation 1940. 673 p illus 23 cm (American Chemical Society monograph series No 81) $15.00 1239

Contents (abridged) Introduction. Synthesis and dissociation. Single-phase systems Water-vapor Water Ice. Multiple-phase systems. Phase transition. Miscellanea. Index.

Note: A compilation of thermodynamic, physical, and descriptive data concerning water-substance. The available informa-

Note: A comprehensive bibliography of the international literature of deuterium and deuterium compounds. The main arrangement is alphabetical by author's names, and indexes are provided to subjects and compounds. Titles of articles are given, and those in foreign languages have been translated without, however, quotation of the original titles.

KLEINBERG, JACOB

Unfamiliar oxidation states and their stabilization. Lawrence: University of Kansas Press, 1950. 131 p. illus. 22 cm. $3.00 1254

Contents (abridged): Low oxidation states of the elements of the aluminum group. Oxygen. The superoxides of the alkali and alkaline earth metals. The halogens. Copper and silver. Chromium and manganese. Iron, cobalt, and nickel. The platinum metals. References. Index.

Note: A book of interest to advanced graduate students in chemistry and to professional chemists. In it are discussed certain unfamiliar states of inorganic elements which are uncommon but whose existence has nevertheless been clearly established. A good share of the book has to do with stabilization of these rare states by such means as alkaline solutions, use of solvents which possess reducing properties, and the insertion of conditions which favor the desired oxidation state. The study of these states is valuable from several standpoints, such as the insight gained into atomic structure, the making of greater accuracy in the planning of chemical reactions, and the production of new chemical substances. Though brief, the work is based on an extensive review of the literature, and has an eight-page bibliography.

LATIMER, WENDELL MITCHELL

Oxidation potentials: the oxidation states of the elements and their potentials in aqueous solutions. Second edition. New York: Prentice-Hall, Inc., 1952. 392 p. illus. 24 cm. (Prentice-Hall chemistry series, Wendell M. Latimer, editor) $8.00 1255

Contents: Units, conventions, and general methods employed in the determination of oxidation-reduction potentials. Entropies, potentials, heats of solution, lattice energies, and their relation to standard oxidation-reduction potentials. Hydrogen. Oxygen. The halogens. Sulphur, selenium, tellurium, and polonium. Nitrogen, phosphorus, arsenic, antimony, and bismuth. Carbon, silicon, germanium, tin, and lead. Gallium, indium, and thallium. Zinc, cadmium, and mercury. Copper, silver, and gold. Nickel, palladium, and platinum. Cobalt, rhodium, and iridium. Iron, ruthenium, and osmium. Manganese, technetium, and rhenium. Chromium, molybdenum, and tungsten. Vanadium, niobium, and tantalum. Titanium, zirconium, and hafnium. Boron, aluminum, scandium, and yttrium. Lanthanum and rare earth elements—the lanthanide series. The actinide elements. Beryllium, magnesium, calcium, strontium, barium, and radium. Lithium, sodium, potassium, rubidium, cesium, and francium. Appendices: Summary of oxidation-reduction potentials. The activity of strong electrolytes. The estimation of entropy values. Study questions. Author index. Subject index.

Note: A reference book of thermodynamic data pertaining to the elements and their chief inorganic compounds. For each element the following information is given: the number of valence electrons, the oxidation states, heats of formation, free energies of formation, entropies, and [illegible] diagrams, if the element has more than one oxidation state. Some of the data are taken from the literature, and references are given to the sources. Other data are based on the author's own calculations. In the present edition more information has been included on reaction mechanisms, and there is a new chapter on actinium, neptunium, plutonium and americium. In other parts numerous changes have been made in values and constants. References to the literature published since 1938 have been added.

LATIMER, WENDELL MITCHELL, AND JOEL H. HILDEBRAND

Reference book of inorganic chemistry. Third edition. New York: The Macmillan Company, 1951. 625 p. 22 cm. $5.50 1256

Contents (abridged): Hydrogen. Inert gases. Oxygen. Alkali metals. Boron, aluminum. Copper, silver and gold. Gallium, indium, and thallium. The halogens. Nitrogen, phosphorus, arsenic, antimony, and bismuth. Carbon. Silicon. Sulfur, selenium, tellurium, and polonium. Iron, cobalt and nickel. Platinum and palladium metals. The actinide elements. Nuclear reactions. Glossary. Appendix. Index.

Note: A compendium of reference data on such points as electronic structure, physical, and chemical properties, methods of preparation, uses, and important compounds of the elements. The arrangement is by element and [illegible] of elements. Although numerous tables are included, most of the information is presented in narrative style, for instance: "Amorphous silicon is prepared by the high temperature reduction of silicon halides by alkali metals, or of the dioxide by magnesium. $SiCl_4 + 4\ Na = Si + 4\ NaCl$." The book was originally prepared as a supplement to an introductory college text of which the current edition is J. H. Hildebrand and R. E. Powell, *Principles of chemistry*, sixth edition, New York, The Macmillan Company, 1952, 441 p. $4.50. The two works are available as separate books and also bound together. However the *Reference book* may be used quite independently of the *Principles*. In comparison to the second edition, published in 1940, the work is [illegible] pages larger, contains one new chapter and [illegible] number of other revisions.

MOELLER, THERALD

Inorganic chemistry: an advanced textbook. New York: John Wiley & Sons, Inc., 1952. 966 p. illus. 24 cm. $12.00 1257

Contents (abridged): Part I. Principles: Atomic nuclei and properties related thereto. The extranuclear structures of the atoms. Characteristics dependent upon the extranuclear structures. I. Generalities. Valency and the chemical bond. Complex ions and coordination compounds. Oxidation-reduction—oxidation potentials. Acids and bases. Non-aqueous solvents. Part II. The chemical elements: The inert gas elements. Hydrogen. The halogens. The oxygen family. The nitrogen family. The carbon family. The boron family. The alkali and coinage metals. The alkaline earth and zinc family elements. The transition elements. The inner transition elements. Appendices: Characteristics of the naturally occurring isotopes. Members of the disintegration series. Author index. Subject index.

Note: The field of inorganic chemistry is poorly supplied with modern textbooks, and advanced texts are uncommon. This work, developed on the basis of a course offered for a number of years at the University of Illinois, is a well-organized presentation of the scientific bases of modern inorganic chemistry together with a description at an advanced level of the characteristics and properties of the inorganic compounds. It is intended for the instruction of advanced undergraduate and first-year graduate students who are preparing for careers in chemistry. However, although it is not encyclopedic in scope, so much ground is covered that it is useful also as a reference book and guide to the literature. There are several hundred tables of constants and other data, and so much literature is cited that the author index runs to 11 two-column pages. The author is a member of the faculty of the University of Illinois.

MURPHY, GEORGE M., AND OTHERS, editors

Production of heavy water. Part I, by James O. Maloney, George F. Quinn, and Harold S. Ray (deceased). Part II, by Maxwell L. Eidinoff, George G. Joris, Ellison Taylor, Hugh S. Taylor, and Harold C. Urey. New York: McGraw-Hill Book Company, Inc., 1955. 394 p. illus. 24 cm. (National nuclear energy series. Manhattan Project technical section. Division III, Vol. 4F) $5.25 1258

Contents: Part I. Commercial production of heavy water: Introduction to Part I. Catalytic exchange–electrolytic process for the production of heavy water at Trail, B. C. Water-distillation process for the production of heavy water as employed by E. I. du Pont de Nemours & Co., Inc., at Morgantown, W. Va. Hydrogen-distillation process for the production of heavy water. Miscellaneous processes for the production of heavy water. Part II. Laboratory studies for separation processes: Introduction to Part II. Distillation of water. Catalytic exchange process. Development of nickel-chromium oxide as a catalyst for isotopic exchange between hydrogen and water. Catalytic exchange—platinum and palladium catalysts. Hydrogen–water vapor exchange glass pilot plant. Dual-temperature process—hydrogen sulfide–water, ammonia–hydrogen, and cyclohexane–hydrogen systems. Appendixes: Electrolytic process. Operating data, Trail, Aug. 1 to 31, 1943. Economic calculation of the [illegible] process performance data, August 1943. Economic

—— Volume IV Editor in-chief, John C Bailar, jr Associate editors Jacob Kleinberg and others Advisory Board Ludwig F Audrieth and others New York McGraw Hill Book Company, Inc., 1953 218 p illus. 23 cm $5 00 1245

Contents (abridged) Lithium nitride. Extraction of cesium from pollucite. Gold powder and potassium tetrabromoaurate(III) Calcium dihydrogen orthophosphate 1-hydrate *Aluminum phosphide.* Biurea. Urazine. Carbohydrazide. Cyanate condensation products of carbohydrazide. Thiosemicarbazide Iodotrichlorosilane and diiododichlorosilane Cyclohexyltrichlorosilane *Nitrosyl chloride.* Phosphorous acid. Diethyl phosphite. Alkyl dichlorophosphites. Disodium dihydrogen hypophosphate. Phosphorus(V) sulfochloride. Diethyl monoamidophosphate, Sodium superoxide. Xanthates and dithiocarbamates of selenium(II) and tellurium(II) Addition compounds of chromium(VI) oxide. Potassium pentachloroaquomolybdate(III) and potassium hexachloromolybdate(III) *Anhydrous metal halides.* Bismuth (III) iodide. Aluminum iodide. Th(IV) iodide. Vanadium(II) chloride. Tantalum(V) bromide. Fluorination of volatile inorganic compounds. Silicon tetrafluoride. Arsenic(III) fluoride. Chlorine(IV) oxide. Iron(II) formate. Potassium ferrate(VI) Acidopentamminecobalt(III) salts. *trans*-Dinitrodiammineopalladium(II) Index of contributors. Subject index. Formula index.

Note The purpose of this series is to make available new or improved methods for the laboratory preparation of inorganic compounds. For each synthesis published this information is given: equation, name of chemist who submitted it, name of chemist who checked it, a brief preliminary discussion of the reaction and procedure, the procedure in detail a description of the chemical and physical properties of the prepared compound, analytical data and literature references. The number of syntheses in each of the first four volumes runs from 58 to 81. Volume IV contains a cumulative index to Volumes I–IV

JACOBSON, CARL ALFRED, compiler and editor

Encyclopedia of chemical reactions Volume I New York Reinhold Publishing Corporation, 1946 804 p 24 cm. $15 00 1246

Contents: Aluminum reactions. Antimony reactions. Arsenic reactions. Barium reactions. Beryllium reactions. Bismuth reactions. Boron reactions. Bromine reactions. List of abstractors. Index to reagents. Index to substances obtained.

—— Volume II. New York Reinhold Publishing Corporation 1948 917 p 24 cm $17 50 1247

Contents: Abbreviations. Cadmium reactions. Calcium reactions. Carbon reactions. Cerium reactions. Cesium reactions. Chlorine reactions. Chromium reactions. List of abstractors. Journals used by abstractors. Index to reagents (formulas) Index to reagents (names) Index to substances obtained (formulas) Index to substances obtained (names)

—— Volume III New York Reinhold Publishing Corporation, 1949 842 p. 24 cm. $17.50 1248

Contents Introduction. Abbreviations. Cobalt. Columbium. Copper Didymium. Dysprosium Erbium. Europium. Fluorine. Gadolinium. Gallium. Germanium. Gold. Hafnium. Holmium. Hydrogen. Illinium. Indium. Iridium. List of abstractors. Journals used by abstractors. Index to reagents (formulas) Index to reagents (names) Index to substances obtained (formulas) Index to substances obtained (names)

—— Volume IV New York Reinhold Publishing Corporation 1951 790 p 24 cm. $17.50 1249

Contents. Introduction. Abbreviations. Iron. Lanthanum. Lead. Lithium. Magnesium. Manganese. Mercury Molybdenum. Neodymium. List of abstractors. Journals used by abstractors. Index to reagents (formulas) Index to reagents (names) Index to substances obtained.

—— Volume V With the assistance of Clifford A Hampel and Elbert C. Weaver New York Reinhold Publishing Corporation, 1953 787 p 24 cm $17.50 1250

Contents Abbreviations. Nickel. Niobium. Nitrogen. Osmium. Oxygen. Palladium. Phosphorus. Platinum. Potassium. Praseodymium. Radium. Rhenium. Rhodium. Rubidium. Ruthenium. List of abstractors. Journals used by abstractors. Index to reagents (formulas) Index to reagents (names) Index to substances obtained.

—— Volume VI Edited by Clifford A. Hampel New York Reinhold Publishing Corporation, 1956 438 p 24 cm. $12.50 1251

Contents Samarium. Scandium. Selenium. Silicon. Silver Sodium. List of abstractors. List of journals used by abstractors. Index to reagents. Index to substances obtained.

Note The volumes listed above represent those published to the end of 1956 of a reference work designed to provide short description and literature references of all reactions of inorganic substances that have been reported in the literature. In each volume, the arrangement is alphabetical, first by chemical elements, then, under each element, by reactant and reagent. The information given for each reaction varies, but always includes an expression of it in equation form and a reference to the original source. Brief data on procedures, conditions, and properties of the products are given in some instances. Each volume contains full and useful indexes. The work was commenced by Professor Jacobson, who was aided by a large group of abstractors. Professor Jacobson died before Volume V was published. Preparation, from Professor Jacobson's file, of Volumes V and VI was carried out under the editorship of Clifford A. Hampel. Additional volumes from the same source, and presumably under the same editorship are planned. Although the work falls short of its goal of reporting all published reactions, it is, and is likely to remain, the most comprehensive compilation of inorganic reactions.

KILLEFFER, DAVID HERBERT, AND ARTHUR LINZ

Molybdenum compounds, their chemistry and technology With a chapter on the structural chemistry of molybdenum by Linus Pauling New York Interscience Publishers, 1952 407 p 24 cm $12 00 1252

Contents Introduction. Sources of molybdenum compounds. Properties of molybdenum. Oxides of molybdenum. Sulfides of molybdenum. Halides of molybdenum. Molybdenum in anions. Complex anions of molybdenum. The structural chemistry of molybdenum. Molybdenum in life processes. Analytical procedures. Molybdenum in colors. Miscellaneous applications of molybdenum compounds. Molybdenum catalysts. Subject index.

Note Essentially this work is a critical digest of the published literature bearing on the chemistry of molybdenum and on the chemical applications of the element. Metallurgical applications are not covered. The typical chapter is a condensed discussion supplemented by tabulated data and literature references. The chapter on analytical procedures is one of the longer ones in the book and consists largely of detailed descriptions of procedures used in the laboratory of the Climax Molybdenum Company. The chapter on molybdenum catalysts, together with the bibliographies of patent and other literature that accompany it, falls only a few pages short of half of the length of the whole book. Though not a well-organized treatise the work is highly useful as a guide to the literature and to the high points of the subject.

KIMBALL, ALICE H., compiler

Bibliography of research on heavy hydrogen compounds edited by Harold C. Urey and Isidor Kirshenbaum. New York McGraw Hill Book Company Inc. 1949 350 p 24 cm (National nuclear energy series Manhattan Project technical section. Division III —Volume 4C) $4 75 1253

Note: A comprehensive bibliography of the international literature of deuterium and deuterium compounds. The main arrangement is alphabetical by author's names, and indexes are provided to subjects and compounds. Titles of articles are given, and titles in foreign languages have been translated without, however, quotation of the original titles.

KLEINBERG, JACOB

Unfamiliar oxidation states and their stabilization. Lawrence University of Kansas Press, 1950 131 p. illus. 22 cm. $3.00 1254

Contents (abridged): Low oxidation states of the elements of the aluminum group. Oxygen. The superoxides of the alkali and alkaline earth metals. The halogens. Copper and silver. Chromium and manganese. Iron, cobalt, and nickel. The "rare-earths." References. Index.

Note: A book of interest to advanced students majoring in chemistry and to professional chemists. In it are discussed certain oxidation states of inorganic elements which are uncommon but whose existence has nevertheless been clearly established. A good share of the book has to do with stabilization of these rare states by such means as alkaline solutions, use of solvents which possess pertinent properties, and the selection of conditions which favor the desired oxidation state. The study of these states is valuable from several standpoints, such as the insight gained into atomic structure, the attaining of greater accuracy in the planning of chemical reactions, and the production of new chemical substances. Though brief, the work is based on an extensive review of the literature, and has an eight-page bibliography.

LATIMER, WENDELL MITCHELL

Oxidation potentials the oxidation states of the elements and their potentials in aqueous solutions. Second edition. New York Prentice-Hall, Inc., 1952 392 p. illus. 24 cm. (Prentice-Hall chemistry series Wendell M. Latimer editor) $8.00 1255

Contents: Units, conventions, and general methods employed in the determination of oxidation-reduction potentials. Ionization potentials, electron affinities, lattice energies, and their relation to standard oxidation-reduction potentials. Hydrogen. Oxygen. The halogens. Sulphur, selenium, tellurium, and polonium. Nitrogen, phosphorus, arsenic, antimony and bismuth. Carbon, silicon, germanium, tin, and lead. Gallium, indium, and thallium. Zinc, cadmium, and mercury. Copper, silver, and gold. Nickel, palladium and platinum. Cobalt, rhodium, and iridium. Iron, ruthenium, and osmium. Manganese, technetium, and rhenium. Chromium, molybdenum, and tungsten. Vanadium, niobium, and tantalum. Titanium, zirconium and hafnium. Boron, aluminum, scandium, and yttrium. Lanthanum and rare earth elements—the lanthanide series. The actinide elements. Beryllium, magnesium, calcium, strontium, barium, and radium. Lithium, sodium, potassium, rubidium, cesium, and francium. Appendices: Summary of oxidation-reduction potentials. The activity of strong electrolytes. The estimation of entropy values. Study questions. Author index. Subject index.

Note: A reference book of thermodynamic data pertaining to the elements and their chief inorganic compounds. For each element the following information is given: the number of valence electrons, the oxidation states, heats of formation, free energies of formation, entropies, and "potential diagrams" if the element has more than one oxidation state. Some of the data are taken from the literature, and references are given to the sources. Other data are based on the author's own calculations. In the present edition more information has been included on reaction mechanisms, and there is new chapter on uranium, neptunium, plutonium and americium. In other parts numerous changes have been made in values and constants. References to the literature published since 1938 have been added.

LATIMER, WENDELL MITCHELL, AND JOEL H HILDEBRAND

Reference book of inorganic chemistry Third edition. New York The Macmillan Company 1951 625 p 22 cm. $5.50 1256

Contents (abridged): Hydrogen. Inert gases. Oxygen. Alkali metals. Boron, aluminum. Copper, silver, and gold. Gallium, indium, and thallium. The halogens. Nitrogen, phosphorus, arsenic, antimony, and bismuth. Carbon. Silicon. Sulfur, selenium, tellurium, and polonium. Iron, cobalt and nickel. Platinum and palladium metals. The actinide elements. Nuclear reactions. Glossary. Appendices. Index.

Note: A compendium of reference data on such points as electronic structure, physical and chemical properties, methods of preparation, uses, and important compounds of the elements. The arrangement is by element and family of elements. Although numerous tables are included, most of the information is presented in narrative style, for instance: "Amorphous silicon is prepared by the high temperature reduction of silicon halides by alkali metals, or of the dioxide by magnesium: $SiCl_4 + 4\ N = Si + 4\ N\ Cl$." The book was originally prepared as a supplement to an introductory college text of which the current edition is: J. H. Hildebrand and R. E. Powell, *Principles of chemistry* sixth edition, New York, The Macmillan Company 1952 444 p. $4.50. The two works are available as separate books and also bound together. However the *Reference* book may be used quite independently of the *Principles*. In comparison to the second edition, published in 1940, the work is 63 pages longer, contains one new chapter and a fair number of other revisions.

MOELLER, THERALD

Inorganic chemistry an advanced textbook. New York John Wiley & Sons Inc. 1952 966 p. illus. 24 cm. $12.00 1257

Contents (abridged): Part I, Principles: Atomic nuclei and properties related thereto. The extranuclear structures of the atoms. Characteristics dependent upon the extranuclear structures. I, General—II, Valency and the chemical bond. Complex ions and coordination compounds. Oxidation-reduction—oxidation potentials. Acids and bases. Non-aqueous solvents. Part II, The chemical elements: The inert gas elements. Hydrogen. The halogens. The oxygen family. The nitrogen family. The carbon family. The boron family. The alkali and coinage metals. The alkaline earth and zinc family elements. The transition elements. The inner transition elements. Appendices: Characteristics of the naturally occurring isotopes. Members of the disintegration series. Author index. Subject index.

Note: The field of inorganic chemistry is poorly supplied with modern textbooks, and advanced texts are uncommon. This work, developed on the basis of a course offered for a number of years at the University of Illinois, is a well-organized presentation of the scientific bases of modern inorganic chemistry, together with a description at an advanced level of the characteristics and properties of the inorganic compounds. It is intended for the instruction of advanced undergraduates and first-year graduate students who are preparing for careers in chemistry. However, although it is not cyclopedic in scope, so much ground is covered that it is useful also as a reference book and guide to the literature. There are several hundred tables of contents and other data, and so much literature is cited that the author index to it runs to 19 two-column pages. The author is a member of the faculty of the University of Illinois.

MURPHY, GEORGE M AND OTHERS editors

Production of heavy water Part I, by James O Maloney George F Quinn, and Harold S Ray (deceased) Part II by Maxwell L. Eidinoff George G Joris, Ellison Taylor Hugh S Taylor and Harold C. Urey New York McGraw Hill Book Company Inc., 1955 394 p illus. 24 cm. (National nuclear energy series. Manhattan Project technical section. Division III Vol. 4F) $5.25 1258

Contents: Part I, Commercial production of heavy water: Introduction to Part I. Catalytic exchange—electrolytic process for the isolation of heavy water at Trail, B. C. Water-distillation process for the isolation of heavy water as employed by E. I. du Pont de Nemours & Co. Inc., at Morgantown, W. Va. Hydrogen-distillation process for the isolation of heavy water. Miscellaneous processes for the isolation of heavy water. Part II, Laboratory studies for separation processes: Introduction to Part II. Distillation of water. Catalytic exchange—general. Development of nickel-chromium oxide as a catalyst for isotopic exchange between hydrogen and water. Catalytic exchange—platinum and palladium catalysts. Hydrogen—water vapor exchange glass pilot plant. Dual-temperature process—ammonia-water, ammonia-water-hydrogen, and cyclohexane-hydrogen systems. Appendices: Electrolytic process. Operating data, Project 9, Aug. 1 to 31, 1943. Illustrative calculation of the fourth-stage tower performance data, August 1943. Illustrative

—— Volume IV Editor-in-chief, John C. Bailar, jr Associate editors Jacob Kleinberg and others. Advisory Board Ludwig F Audrieth and others New York McGraw Hill Book Company, Inc., 1953 218 p illus 23 cm $5 00 *1245*

Contents (abridged): Lithium nitride. Extraction of cesium from pollucite. Gold powder and potassium *tetra*bromoaurate(III) Calcium dihydrogen orthophosphate 1-hydrate. Aluminum phosphide. Biuret. Urazine. Carbohydrazide. Cyanate condensation products of carbohydrazide. Thiosemicarbazide. Iodotrichlorosilane and diiododichlorosilane. Cyclohexyltrichlorosilane. Nitrosyl chloride Phosphorous acid. Dioctyl phosphite. Alkyl dichlorophosphites. Disodium dihydrogen hypophosphate. Phosphorus(V) sulfochloride. Diethyl monoamidophosphate. Sodium superoxide. Xanthates and dithiocarbamates of selenium(II) and tellurium(II) Addition compounds of chromium(VI) oxide. Potassium pentachloroaquomolybdate(III) and potassium hexachloromolybdate(III) Anhydrous metal halides. Bismuth (III) iodide. Aluminum iodide. Tin(IV) iodide. Vanadium(II) chloride. Tantalum(V) bromide. Fluorination of volatile inorganic compounds. Silicon tetrafluoride. Arsenic(III) fluoride. Chlorine(IV) oxide Iron(II) formate. Potassium ferrate(VI) Acidopentamminecobalt(III) salts. *trans*-Dinitrodiamminepalladium(II) Index of contributors. Subject index. Formula index.

Note The purpose of this series is to make available new or improved methods for the laboratory preparation of inorganic compounds. For each synthesis published this information is given equation, name of chemist who submitted it, name of chemist who checked it, brief preliminary discussion of the reaction and procedure, the procedure in detail, a description of the chemical and physical properties of the prepared compound, analytical data and literature references. The number of syntheses in each of the first four volumes runs from 58 to 81 Volume IV contains a cumulative index to Volumes I-IV

JACOBSON, CARL ALFRED, compiler and editor

Encyclopedia of chemical reactions. Volume I New York Reinhold Publishing Corporation 1946 804 p 24 cm $15 00 1246

Contents: Aluminum reactions. Antimony reactions. Arsenic reactions. Barium reactions. Beryllium reactions. Bismuth reactions. Boron reactions. Bromine reactions. List of abstractors. Index to reagents. Index to substances obtained.

—— Volume VI Edited by Clifford A. Hampel. New York Reinhold Publishing Corporation, 1956 438 p 24 cm. $12 50 1251

Content Samarium. Scandium. Selenium. Silicon. Silver. Sodium. List of abstractors. List of journals used by abstractors. Index to reagents. Index to substances obtained.

Note The volumes listed above represent those published to the end of 1956 of a reference work designed to provide short descriptions and literature references of all reactions of inorganic substances that have been reported in the literature. In each volume, the arrangement is alphabetical, first by chemical elements, then, under each element, by reactant and reagent. The information given for each reaction varies, but always includes an expression of it in equation form and a reference to the original source. Brief data on procedures, conditions, and properties of the products are given in some instances. Each volume contains full and useful indexes. The work was commenced by Professor Jacobson, who was aided by a large group of abstractors. Professor Jacobson died before Volume V was published. Preparation, from Professor Jacobson's file, of Volumes V and VI was carried out under the editorship of Clifford A. Hampel. Additional volumes from the same source, and presumably under the same editorship, are planned. Although the work falls short of its goal of reporting all published reactions, it is, and is likely to remain, the most comprehensive compilation of inorganic reactions.

KILLEFFER, DAVID HERBERT, AND ARTHUR LINZ

Molybdenum compounds, their chemistry and technology With a chapter on the structural chemistry of molybdenum by Linus Pauling New York Interscience Publishers, 1952 407 p 24 cm $12 00 *1252*

Content Introduction. Sources of molybdenum compounds. Properties of molybdenum. Oxides of molybdenum. Sulfides of molybdenum. Halides of molybdenum. Molybdenum in anions. Complex anions of molybdenum. The structural chemistry of molybdenum. Molybdenum in life processes. Analytical procedures. Molybdenum in colors. Miscellaneous applications of molybdenum compounds. Molybdenum catalysts. Subject index.

Note Essentially this work is a critical digest of the published literature bearing on the chemistry of molybdenum and on the chemical applications of the element. Metallurgical applications are not covered. The typical chapter is a condensed discussion supplemented by tabulated data and literature references. The chapter on analytical procedures is one of the longer ones in the book and consists largely of detailed descriptions of procedures used in the laboratory of the Climax Molybdenum Company. The chapter on molybdenum catalysts, together with the bibliographies of patent and other literature that accompany it, falls only a few pages short of half of the length of the whole book. Though not a well-organized treatise, the work is highly useful as a guide to the literature and to the high points of the subject.

KIMBALL, ALICE H , compiler

Bibliography of research on heavy hydrogen compounds edited by Harold C Urey and Isidor Kirshenbaum. *New York* McGraw Hill Book Company, Inc., 1949 350 p 24 cm (National nuclear energy series Manhattan Project technical section. Division III —Volume 4C) $4 75 *1253*

Seaborg. Princeton D Van Nostrand Company Inc., 1953 232 p. illus. 23 cm. $5.00 1263

—— Volume II Copper silver and gold, by J W Laist. Princeton D Van Nostrand Company Inc., 1954 248 p illus. 23 cm. $5.00. 1264

—— Volume III The halogens, by R. C. Brasted. Princeton D Van Nostrand Company Inc., 1954 250 p illus. 23 cm. $5.00 1265

—— Volume IV Zinc, cadmium, and mercury by Howard M Cyr and the editors. Scandium, yttrium and the lanthanide series, by Thomas D O'Brien and the editors Princeton D Van Nostrand Company Inc., 1955 193 p. illus. 23 cm. $5.00 1266

—— Volume V Nitrogen, phosphorus arsenic, antimony and bismuth, by Harry H. Sisler Nonaqueous chemistry by Alfred R. Pray Princeton D Van Nostrand Company Inc., 1956 214 p. illus. 23 cm. $5.00 1267

Note: A series planned to cover at the professional level all of the inorganic elements and their principal compounds. The coverage is not encyclopedic; although all of the inorganic elements will be treated in the complete set, the compounds discussed are selected. Furthermore, basic concepts, such as atomic and molecular structure, the periodic system, physical and chemical properties, typical reactions, and preparative processes are emphasized. Even the last mentioned are carefully selected. The set is designed to be an aid in orientation and reference to chemists working in academic and industrial laboratories. Well-selected literature references are special features. The five volumes listed above had been published to the end of 1956. Six more volumes are planned.

TULLER, WILLIAM N editor
The sulphur data book. Compiled by the technical staff, Freeport Sulphur Company edited by William N Tuller New York McGraw Hill Book Company Inc., 1954 143 p. 24 cm. $5.00. 1268

Contents: The nature of sulphur. Physical and chemical properties. Reaction thermodynamics. Solubility. Analysis of sulphur. Sulphuric acid conversion tables. Bibliography. Index.

Note: A well-compiled reference book on one of the most important raw materials of chemical industry. A wide range of properties and behavior characteristics is presented in condensed form in the numerous tables and charts which comprise most of the book. The second chapter for instance, includes data on the viscosity surface tension, molecular composition, vapor pressure, heat capacity specific volume and thermodynamic properties of one or more states of sulphur. The data have been selected critically from the literature. There is a bibliography of 43 references.

YOST DON M., AND OTHERS
The rare-earth elements and their compounds, by Don M Yost, Horace Russell, Jr and Clifford S Garner New York John Wiley & Sons Inc., 1947 92 p illus. 24 cm. $4.50. 1269

Contents: Electronic structures and oxidation states of the rare earth elements. Paramagnetic properties of rare-earth compounds. Absorption spectra of rare-earth compounds. Evidence for the existence of element 61. Separation of the rare earths. Chemical and physical properties of the rare earths. Appendices: Nuclear properties of the rare-earth elements. General physical constants. The periodic system of the elements. Index of names. Subject index.

Note: This survey of the current knowledge of the chemical and physical properties of the elements in rare-earths group will be useful chiefly to graduate chemists and physicists. In the chapter on element 61 the authors conclude that at the time of writing their manuscript the evidence of its discovery was not conclusive. The text includes numerous references to the related literature.

YOST DON M., AND HORACE RUSSELL JR.
Systematic inorganic chemistry of the fifth- and sixth-group nonmetallic elements New York Prentice Hall Inc. 1944 423 p 23 cm. (Prentice Hall chemistry series W M Latimer editor) $5.75 1270

Contents (abridged): Nitrogen and its oxides and sulfides. Nitrogen oxyhalides and oxyacids. The fixation of nitrogen. Hydroxylamine, amine sulfonates, phosphorus chloronitrides, hydrazine and hydrazoic acid. Ammonia and liquid ammonia solutions. Phosphorus, phosphorus oxides, and phosphorus sulfides. The oxyacids of phosphorus. Phosphorus halides and oxyhalides. Phosphine. Oxygen, sulfur, selenium, tellurium, and their compounds with hydrogen. The halides and oxyhalides of sulfur selenium, and tellurium. The oxides and oxyacids of sulfur selenium, and tellurium. Hydrogen peroxide, hydrogen persulfides, and the peroxyacids. Metallic peroxides and superoxides. Polythionic acids. Appendices: Bibliography. General physical constants. Periodic system of the elements. Subject index. Name index.

Note: An advanced textbook on kinetics, molecular structure, thermodynamics, magnetic properties, and statistical mechanical calculations are integrated into discussions of chemical behavior and physical properties. Reaction rates are given in 70 figures and over 33 tables. Research problems are given, and bibliography of reference works is included.

ORGANIC CHEMISTRY

ADVANCES IN CARBOHYDRATE CHEMISTRY Volume 10 Editor Melville L. Wolfrom assistant editor R. Stuart Tipson. Board of advisors Hermann O L. Fischer and others. Board of advisors for the British Isles E. L. Hirst and others. New York Academic Press Inc., 1955 437 p. illus. 23 cm. $10.50 1271

Contents: Edward George Vincent Percival, 1902–1951. The stereochemistry of cyclic derivatives of carbohydrates, by J. A. Mills. Column chromatography of sugars and their derivatives, by W W Binkley. Glycosylamines, by G. P. Ellis and J. Honeyman. The amadori rearrangement, by J. E. Hodge. The glycosyl halides and their derivatives, by L. J. Haynes and F H. Newth. The methyl ethers of the aldopentoses and the rhamnose and fucose, by G. G. Maher. The methyl ethers of D-galactose, by G. G. Maher. Polysaccharides associated with wood cellulose, by W. J. Polglase. The chemistry of heparin, by A. B. Foster and A. J. Huggard. Author index. Subject index. Contents of Volumes 1–9

—— Volume 11 Academic Press Inc. 1956 465 p illus 23 cm. $11.00 1272

Contents: Kurt Heinrich Meyer 1883–1952. Periodate oxidation of carbohydrates, by J. M. Bobbitt. The osazones, by E. Reyes and L. A. Fowler. Reactions of monosaccharides with beta-ketonic esters and related substances, by F. Garcia Gonzalez. Kojic acid, by A. Beélik. The biosynthesis of the monosaccharides, by L. Hough and J. K. N. Jones. Branched-chain sugars of natural occurrence, by F. Shafizadeh. Nucleic acids, by G. R. Barker. Aspects of the physical chemistry of starch, by C. T. Greenwood. Addendum. Author index. Subject index. Cumulative author index (Vols. 1–10). Cumulative subject index (Vols. 1–10). Errata and addenda.

Note: Listed above are the contents of two annual volumes in an established and useful review series. As the titles of the papers indicate, the term "carbohydrate chemistry" is interpreted broadly. In most volumes in the series, there are reviews that contain material of interest to specialists in biochemistry pharmaceutical chemistry and polymer chemistry as well as to specialists

calculation of alpha for a secondary-plant rundown. Equilibrium constants for exchange reactions involving mercaptans. Index.

Note. The first part of this book compares the various methods of production of heavy water and draws specific comparisons among three—catalytic exchange, distillation of H_2O and distillation of hydrogen—which have been employed in the large-scale production of heavy water. It also makes definite recommendations as to processes and plant layouts most suitable for future production of this compound. The second part is a detailed account of laboratory and pilot-plant studies carried out at Columbia University as part of the program of development of the atomic bomb under a contract with the Manhattan Engineer District, the predecessor to the Atomic Energy Commission.

SCHUMB, WALTER C., AND OTHERS

Hydrogen peroxide. By Walter C. Schumb, Charles N. Satterfield and Ralph L. Wentworth. New York: Reinhold Publishing Corporation, 1955. 759 p. illus. 24 cm. (American Chemical Society monograph series) $17.50 1259

Contents: Introduction. Formation and manufacture: I, Directly from water or oxygen—II, From peroxy compounds. Concentration, purification, structural materials, handling. Physical properties. Structure. Chemical properties. Decomposition processes. Stabilization. Analytical procedures. *Uses of hydrogen peroxide.* Inorganic peroxy compounds. Notation. Name index. Subject index.

Note. Publication of this work in a series noted for comprehensive monographs reflects the current interest in hydrogen peroxide, both in the laboratory and in industry. The book is a survey based on the literature and, according to the publishers, there are more than 2,500 literature references. The subject is covered under the headings listed above. Somewhat more space is given to the basic knowledge—for instance, the chapter on physical properties is the longest in the book—but industrial aspects are well covered also. Inorganic peroxide compounds are surveyed in a 32-page chapter which contains a bibliography of 123 citations, but organic peroxides are omitted. The patent literature is cited, along with the journal literature; also included are citations of PB reports and similar series. The book should immediately become the standard reference on hydrogen peroxide in all laboratories where this compound is of interest.

SEABORG, GLENN THEODORE, AND JOSEPH J. KATZ, editors

The actinide elements. Also included: Index for *The transuranium elements,* Division IV, Volume 14B. New York: McGraw-Hill Book Company, Inc., 1954. 870 p. 24 cm. (National nuclear energy series. Manhattan Project technical section. Division IV—Plutonium Project record—Vol. 14A) $11.75 1260

Contents: Introduction, by G. T. Seaborg. The chemistry of actinium, by F. T. Hagemann. Nuclear properties of uranium, protactinium, and thorium isotopes, by L. I. Katzin. The chemistry of thorium, by L. I. Katzin. The chemistry of protactinium, by R. E. Elson. The chemistry of uranium, by H. R. Hoekstra and J. J. Katz. Nuclear properties of the plutonium isotopes, by G. T. Seaborg. Oxidation states, potentials, equilibria, and oxidation-reduction reactions of plutonium, by R. E. Connick. Ionic and molecular species of plutonium in solution, by J. C. Hindman. Preparation and properties of the compounds of plutonium, by B. B. Cunningham. Nuclear properties of the neptunium isotopes, by G. T. Seaborg. The chemistry of neptunium, by B. B. Cunningham and J. C. Hindman. Nuclear properties of the transplutonium nuclides, by G. T. Seaborg. The chemistry of the transplutonium elements, by I. Perlman and K. Street, Jr. Radio-chemical separation of the actinide elements, by E. K. Hyde. Radiochemical assay by alpha and fission measurements, by A. H. Jaffey. Correlation of properties as actinide transition series, by G. T. Seaborg. Crystal chemistry of the 5f elements, by W. H. Zachariasen. Optical properties of some compounds of uranium, plutonium, and related elements, by E. Staritzky and A. L. Truitt. Slow-neutron and spontaneous-fission properties of heavy nuclei, by J. R. Huizenga and others. Appendix. Index—the transuranium elements. Index.

Note: Unlike some of the volumes in this valuable series, the present one incorporates the results of much research carried out since the close of World War II. The elements covered are named in the chapter titles and in the chapters devoted to individual elements, most of the text relates to chemical and physical properties. However several chapters, as their titles show, are devoted to laboratory manipulations and assay techniques. No explanation was found for the inclusion in this volume of the subject index to Volume 14B of the series. Unfortunately this out-of-place index precedes the volume index proper; hence libraries cannot readily remove it for insertion in the volume to which it pertains.

SEABORG, GLENN THEODORE, AND OTHERS, editors

The transuranium elements: research papers, edited by Glenn T. Seaborg, Joseph J. Katz, and Winston M. Manning. New York: McGraw-Hill Book Company, Inc., 1949. 2 v. illus. 24 cm. (National nuclear energy series. Manhattan Project technical section. Division IV—Plutonium Project record—Vol. 14B) $23.75 1261

Note. A collection of original research papers bearing on plutonium and the other transuranium elements. The papers range in date from 1940 to as late as 1948, but most of them were written in 1943–1946 in connection with government-sponsored research on the atomic bomb and atomic energy. *Literature references are* included, and there are some diagrams of apparatus set-ups. The two volumes form a unit and are not sold separately.

SIMONS, J. H., editor

Fluorine chemistry. New York: Academic Press, Inc., 1950–54. 2 v. illus. 24 cm. $13.50 per vol. 1262

Contents: Volume I: Nonvolatile inorganic fluorides, by H. J. Emeléus. Volatile inorganic fluorides, by A. B. Burg. The chemistry of the fluoro acids of fourth, fifth, and sixth group elements, by W. Lange. The halogen fluorides, by H. S. Booth. Boron trifluoride, by H. S. Booth and D. R. Martin. Hydrogen fluoride, by J. H. Simons. Hydrogen fluoride catalysis, by J. H. Simons. Preparation of fluorine, by G. H. Cady. Physical properties of fluorine, by G. H. Cady and L. L. Burger. *The theoretical aspects* of fluorine chemistry, by G. Glockler. The action of elementary fluorine upon organic compounds, by L. A. Bigelow. Fluorocarbons and their production, by J. H. Simons. Fluorocarbons—their properties and wartime development, by T. J. Brice. Fluorocarbon derivatives, by W. H. Pearlson. Aliphatic chlorofluoro compounds, by J. D. Park. Fluorine compounds in glass technology and ceramics, by W. A. Weyl. Author index. Subject index. Volume II: *Fluorine containing complex salts and acids,* by A. G. Sharpe. Halogen fluorides—recent advances, by H. J. Emeléus. Analytical chemistry of fluorine and fluorine-containing compounds, by P. J. *Elving and others. Organic compounds containing fluorine,* by P. Tarrant. Metallic compounds containing fluorocarbon radicals and organometallic compounds containing fluorine, by H. J. Emeléus. Fluorocarbon chemistry, by J. H. Simons and T. J. Brice. The infrared spectra of fluorocarbons and related compounds, *by D. G.* Weiblen. Bibliography. Author index. Subject index.

Note. These two volumes of a projected three-volume comprehensive survey of fluorine chemistry are composed of monographs written by prominent chemists who have made contributions *to the* subject. The editor himself has also been one of the leaders in the development of the field. Each monographic chapter is a compact *review of the literature* and knowledge of a particular aspect of the subject and concludes with a comprehensive list of the pertinent international literature. The third volume, still to be published, will cover the biochemistry of fluorine-containing compounds. Both Volumes I and II contain *fully detailed author and subject indexes.* The work is intended for use by graduate and professional chemists, and it has become established as the standard reference survey of fluorine chemistry.

SNEED, M. CANNON, AND OTHERS

Comprehensive inorganic chemistry. By M. Cannon Sneed, J. Lewis Maynard, and Robert C. Brasted. Volume I: Principles of atomic and molecular structure, W. N. Lipscomb; Theoretical and applied nuclear chemistry, P. R. O'Connor; The actinide series, G. T.

this book follows the pattern of the series and is an integral part of it. It is an organized presentation of information previously published in the periodical literature. The text is condensed, with all important statements keyed to the references of the source articles. Structural diagrams are given for all of the compounds described, and reactions also are diagrammed. There are 71 tables of data on groups of compounds. Literature references are given as foot notes. The subject index is fully detailed.

BRAUDE, E. A., AND F C NACHOD editors
Determination of organic structures by physical methods. New York Academic Press, Inc., 1955 810 p. illus. 24 cm. $15.00 1278

Contents: Part I, The determination of molecular size: Phase properties of small molecules, by E. F Herington and F C. Nachod. Equilibrium and dynamic properties of large molecules, by P Johnson. Part II, The determination of molecular pattern: Optical rotation, by W. Klyne. Ultraviolet and visible light absorption, by E. A. Braude. Infrared light absorption, by R. C. Gore. Raman spectra, by F F Cleveland. Magnetic susceptibilities, by C. A. Hutchison, Jr. Part III, The determination of molecular fine-structure: Surface films, by E. Stenhagen. Dipole moments, by L. E. Sutton. Electron diffraction, by J. Karle and I. L. Karle. X-ray diffraction, by J. M. Robertson. Microwave spectroscopy, by E. B. Wilson, Jr., and D. R. Lide, Jr. Thermodynamic properties, by J. G. Aston. Dissociation constants, by H. C. Brown and others. Reaction kinetics, by E. A. Braude and L. M. Jackman. Wave-mechanical theory by C. A. Coulson. Author index. Subject index.

Note: The many physical, [illegible] mechanical techniques, which may be used in the study of the structure of organic compounds are reviewed in this treatise. The chapter titles cover the techniques which are covered, and all of these are presented from the viewpoint of the research chemist. For example, in the chapter on microwave spectroscopy one finds such statements as, "Microwave spectroscopy is not [illegible] universal tool for the determination of structure, since the kinds of substances which can be studied are severely limited by several restrictions." A discussion of the restrictions then follows. The chapter authors are eminent research chemists associated with universities and other research organizations in the United States of America, Great Britain and Europe. The typical chapter is well-organized literature digest with keyed references from statements in the text to an appended bibliography

BREWSTER, RAY QUINCY
Organic chemistry Second edition. New York Prentice Hall, Inc., 1948 840 p. illus. 24 cm. (Prentice-Hall chemistry series Wendell M Latimer editor) $7 75 1279

Contents (abridged): Part I, Aliphatic compounds: The alkanes or paraffinic hydrocarbons. Unsaturated hydrocarbons. Halogen derivatives of hydrocarbons. Alcohols. Aldehydes and ketones. Monocarboxylic acids (fatty acids). Acid derivatives. Aliphatic amines. Cyanogen and its derivatives. Sulfur compounds. Polyhydric alcohols. Cis-trans isomerism and unsaturated acids. Optical isomerism, halogenated acids, and hydroxy acids. Amino acids and proteins. Carbohydrates. Part II, Aromatic compounds: Sulfonic acids. Aromatic nitro compounds. Aromatic amines. Diazo compounds. Aromatic alcohols and phenols. Aromatic aldehydes, ketones, and quinones. Polynuclear hydrocarbons. Dyes. Alicyclic compounds and terpenes. Heterocyclic compounds and alkaloids. Index.

Note: In this text for college students the principles of organic chemistry are explained in terms of the electronic and resonance theories. Emphasis [illegible] placed on the mechanism of reactions; and the descriptions of properties of various compounds are preceded by discussions of their electronic structure and formulas. A brief review of the fundamentals of atomic structure and the mechanism of chemical reactions is included, but the treatment as [illegible] whole requires [illegible] sound knowledge of general chemistry. Each chapter concludes with review questions and problems. The author is Professor of Chemistry at the University of Kansas

BROOKS BENJAMIN T
The chemistry of the nonbenzenoid hydrocarbons. Second edition, revised and enlarged. New York Reinhold Publishing Corporation 1950. 615 p. illus. 24 cm. $14.00 1280

Contents (abridged): Natural occurrence of the paraffins. Physical properties. Methods of synthesis of paraffins and cycloparaffins. Oxidation of paraffins and cycloparaffins. Reactions of paraffins and cycloparaffins with chemical reagents. Olefinic hydrocarbons: methods of preparation. Isomerization. Polymerization of unsaturated hydrocarbons. Alkylation of unsaturated hydrocarbons. Oxidation of unsaturated hydrocarbons. Other chemical reactions of olefins. The dienes, trienes, and polyenes. Acetylenes. The cycloparaffins. Author index. Subject index.

Note: A classic survey of the hydrocarbons that do not contain the benzene ring structure. When the first edition (published in 1922) was prepared, most organic chemists were interested in the chemistry of the benzene ring and most organic chemical literature was devoted to benzene compounds. The book was [illegible] planned effort to call attention to the chemistry of the other hydrocarbons, especially those found in petroleum. Since 1922 much more has been published on the nonbenzenoid hydrocarbons, but this book still holds its place as [illegible] well-organized and useful monograph. Much material, including new chapters on acetylenic compounds, the dienes, trienes, polyenes, and thermal decomposition of paraffins, has been added in this edition. In effect, the entire work has been rewritten.

BROOKS BENJAMIN T AND OTHERS editors
The chemistry of petroleum hydrocarbons. Edited by Benjamin T Brooks Stewart S Kurtz, jr Cecil E Boord and Louis Schmerling. New York Reinhold Publishing Corporation 1954 3 v illus. Vol I, $18.00 vol II, $13.50 vol. III, $18 00 1281

Contents: Volume [illegible] Hydrocarbons in natural gases, by D T McRoberts and T W Legatski. Hydrocarbons in gasoline, kerosene, gas oils and lubricating oils, by A. N Sachanen. Composition of petroleum waxes, by B. T Brooks. Types of crude petroleum, by W A. Gruse. The composition of shale oils, by H. M Thorne and J. R. Ball. Origin of petroleum, by B. T Brooks. Extractive and azeotropic distillations, by C. S Carlson. Separation of aromatics by selective adsorption, by A. E. Hirschler and T S. Mertes. Principles of solvent extraction, by A. W Francis and W H. King. Separation of paraffins by urea and thiourea, by R. L. McLaughlin. Physical properties and hydrocarbon structure, by S. S. Kurtz, jr. Ultraviolet spectra of hydrocarbons, by W Priestley and R. F Dunkelbarth. Molecular structure and spectroscopic data, by E. J Rosenbaum. Analytical applications of infrared and Raman spectroscopy by H. M. Tenney. Mass spectroscopy of hydrocarbons, by W S. Young. Analysis and composition of the heavier petroleum fractions, by K. Van Nes. Preparation of pure paraffins and olefins, by B. T Brooks. Synthesis of low molecular weight alicyclic hydrocarbons, by J M. Derfer. Synthesis of high molecular weight hydrocarbons, by R. W Schiessler and R. L. McLaughlin. The Fischer-Tropsch process, by H H. Storch. Index. Volume II, Mechanisms for the thermal decomposition of hydrocarbons, by R. W K. Storch and S. Bywater. Conditions and results of thermal cracking for gasoline, by J H. Hirsch and E. K. Fisher. Composition of synthetic and cracked gasolines, by A. N. Sachanen. Acetylene by the pyrolysis of light hydrocarbons, by L. Kramer and J. Happel. Pyrolytic reactions of aromatic hydrocarbons, by C. R. Kinney. Theory of catalytic cracking, by B. S. Greensfelder. The effects of the variables in catalytic cracking, by A. G. Oblad and others. Aromatization, hydroforming and platforming, by V Haensel. Catalytic dehydrogenation, by K. Kearby. Mechanisms of the reactions of nonbenzenoid hydrocarbons, by L. Schmerling. General theory of hydrocarbon oxidation, by B. Lewis and G. von Elbe. Low-temperature oxidation of paraffin [illegible] of paraffin wax, by W E. Vaughan and F F Rust. Olefin autoxidation, by R. H. Rosenwald. Synthesis gas from methane, oxygen and steam, by H. H. Storch. The partial oxidation of the simple paraffinic hydrocarbons, by N. C. Robertson. Special oxidation reactions of unsaturated hydrocarbons, by N. A. Milas. Subject index. Volume III, Oxidation of ortho-xylene to phthalic anhydride, by I. E. Levine. Isomerization of saturated hydrocarbons, by H. Pines, and J. M. Mavity. Chlorination of paraffins and cycloparaffins, by E. T. McBee and H. E. Ungnade. Fluorination and properties of fluoro derivatives of paraffins and cycloparaffins, by E. T McBee and O. R. Pierce. Nitration of paraffins and cycloparaffins, by B. T Brooks. Special chemical reactions of paraffins and cycloparaffins, by B. T Brooks. Isomerization of olefins, by B. T Brooks. Vinyl polymerization, by C. Walling. Polyethylene, by R. L. Kraps and F B. Stickney. Diels-Alder condensations and related reactions, by C. Walling. Polymer gasoline, by K. K. Schaad. The chemistry of natural and synthetic rubbers, by H. L. Fisher. Condensation of saturated halides with olefins, by L. Schmerling. Catalytic hydrogenation of hydrocarbons, by B. B. Corson. Hydrogenation of cracked oils, catalytic naphtha, catalytic cycle stock, and shale oil, by W M. Smith. The oxo reaction, by M. Orchin. Alkylation of saturated hydro-

in sugar chemistry and the other areas of carbohydrate chemistry strictly interpreted. Reviews are topical rather than chronological, with emphasis on recent research and literature. Literature citations accompanying the reviews run to several hundred in some cases. The series is international in scope in two aspects the international literature is covered also, the contributors are drawn from various nations, although chemists working in the United Kingdom and the United States of America predominate.

ALEXANDER, ELLIOT RITCHIE

Principles of ionic organic reactions New York John Wiley & Sons, Inc, 1950 520 p illus 23 cm. $6 00 *1273*

Contents (abridged) Factors influencing distribution and mobility of electrons. Carbonium ions. Displacement reactions. Elimination reactions. Carbanions. Addition reactions of carbon-carbon double bonds. Carbanion addition to carbonyl groups. Carbanion displacement reactions. Formation and cleavage of ethers. Esterification and hydrolysis. Substitution on the benzene nucleus. Diazonium reactions and the Wolff-Kishner reduction. Miscellaneous reactions involving the migration of a double bond. Author index. Subject index.

Note This book is concerned with the mechanisms—interpreted in terms of electron configurations—of common organic reactions. Similarities between organic reactions, rather than differences, are stressed, with the purpose of aiding the experimental organic chemist in understanding and predicting reactions. The work is designed for advanced undergraduates majoring in organic chemistry and for graduate chemists engaged in experimental work. Related literature is cited in footnotes throughout the book.

ALLEN, CHARLES FRANCIS HITCHCOCK

Six membered heterocyclic nitrogen compounds with four condensed rings In collaboration with D M Burness, Jean V Crawford, F W Spangler Eleanor R. Webster, and C V Wilson New York Interscience Publishers, Inc., 1951 345 p illus 24 cm (The chemistry of heterocyclic compounds a series of monographs, Arnold Weissberger, consulting editor) $10 00 1274

Content Azanaphthacenes. Azabenz[a]anthracenes. Azabenzo[c]phenanthrenes. Azachrysenes. Azatriphenylenes. Azabenzanthrenes. Azapyrenes. Azabenzanthrenes—addenda. Index.

Note. One of the monographs in series which currently enjoys the status of being the major reference work on the chemistry and properties of the heterocyclic compounds. The series is planned to cover comprehensively the whole field of heterocyclic chemistry. It is organized in the form of independent monographs, each of which covers specific group or groups of heterocyclic compounds and is written by recognized authority. It does not describe all compounds and their derivatives, but the intention is to include all compounds which are important to academic applied chemists. Another purpose of the series is to serve as guide to the source literature, including the patents. Many volumes in the series are in preparation. Some already published were written by authors who are not citizens or residents f the United States of America or Canada, and therefore do not come within the scope of this bibliography. In the monograph by Allen listed above, each of the chapters is compact summary *of the available information of the* chemical group named in the chapter title. The individual compounds and the available information on their structure and properties is given. Methods of synthesis and reactions are often indicated. The index includes the name of every compound mentioned in the text.

AMERICAN PETROLEUM INSTITUTE RESEARCH PROJECT 44

Selected values of physical and thermodynamic properties of hydrocarbons and related compounds comprising the tables of the American Petroleum Institute Research Project 44 extant as of December 31 1952 By Frederick D Rossini Kenneth S Pitzer, Raymond L Arnett Rita M Braun George C. Pimentel, with contributions from Kun Li, and others Pittsburgh Published for the American Petroleum Institute by Carnegie Press, Carnegie Institute of Technology, 1953 1,050 p 27 cm $7 00 1275

Contents Introduction. Tables of physical and thermodynamic properties. Specific references for tables of properties. General references. Index of properties. Index of compounds. Publications of the API research project 44

Note A reference book of fundamental chemical and physical data. It is based primarily on information available in the literature and unpublished manuscripts, but these data have been critically evaluated, and the "best" values have been tabulated. Original calculations have been made where necessary. Sources are cited. Data obtained later than December 31 1952, are published in sheet form, the sheets being punched for insertion in loose-leaf binders. Information on the sheets available and the prices may be obtained from The Carnegie Institute of Technology Petroleum Research Laboratory Pittsburgh 13, Pa., attention Dr F D Rossini.

ASTLE, MELVIN J, AND J REID SHELTON

Organic chemistry New York Harper & Brothers, 1953 771 p illus. 24 cm. $7.50. 1276

Contents Introduction Paraffin hydrocarbons—alkanes. Olefin hydrocarbons—alkenes. Acetylene hydrocarbons—alkynes. Halogen derivatives of aliphatic hydrocarbons. Alcohols. Ethers. Aldehydes and ketones. Monobasic and dibasic acids. Acid halides, acid anhydrides, and acid amides. Esters—oils, fats, and waxes. Aldo and keto acids—acetoacetic ester and malonic ester syntheses. Unsaturated acids—geometrical isomerism. Halogenated acids—hydroxy acids—optical isomerism. Aliphatic amines. Aliphatic nitro compounds and nitriles. Amino acids and proteins. Aliphatic sulfur compounds. Carbohydrates—the sugars—the polysaccharides. Alicyclic compounds. Aromatic hydrocarbons. Nitration, halogenation, and sulfonation of aromatic compounds. Aromatic amines. Phenols. Aromatic alcohols, aldehydes, and ketones. Aromatic acids. Polynuclear aromatic hydrocarbons. Dyes. Heterocyclic compounds. Alkaloids. Terpenes. Steroids. High polymers. References for supplementary reading. Index.
